

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE PRINCIPLES OF JUDICIAL PROOF

AS CONTAINED IN LOGIC, PSYCHOLOGY, AND GENERAL EXPERIENCE
AND ILLUSTRATED IN JUDICIAL TRIALS

INTRODUCTION

THIS book aspires to offer, though in tentative form only, a *novum organum* for the study of Judicial Evidence.

The study of the principles of Evidence, for a lawyer, falls into two distinct parts. One is Proof in the general sense, — the part concerned with the ratiocinative process of contentious persuasion, — mind to mind, counsel to juror, each partisan seeking to move the mind of the tribunal. The other part is Admissibility, — the procedural rules devised by the law, and based on litigious experience and tradition, to guard the tribunal (particularly the jury) against erroneous persuasion. Hitherto, the latter has loomed largest in our formal studies, — has, in fact, monopolized them; while the former, virtually ignored, has been left to the chances of later acquisition, casual and empiric, in the course of practice. Here we have been wrong; and in two ways:

For one thing, there is, and there *must* be, a probative science — the principles of proof — independent of the artificial rules of procedure; hence, it can be and should be studied. This science, to be sure, may as yet be imperfectly formulated or even incapable of formulation. But all the more need is there to begin in earnest to investigate and develop it. Furthermore, this process of Proof is the more important of the two, — indeed, is the ultimate purpose in every judicial investigation. The procedural rules for Admissibility are merely a preliminary aid to the main activity, viz. the persuasion of the tribunal's mind to a correct conclusion by safe materials. This main process is that for which the jury are there, and on which the counsel's duty is focused. Vital as it is, its principles surely demand study.

And, for another thing, the judicial rules of Admissibility are destined to lessen in relative importance during the next generation or later. Proof will assume the important place; and we must therefore prepare ourselves for this shifting of emphasis. We must seek to acquire a scientific understanding of the principles of what may be called "natural" proof, — the hitherto neglected process. If we do not do this, history will repeat itself, and we shall find ourselves in the

present plight of Continental Europe. There, in the early 1800s the ancient worn-out numerical system of "legal proof" was abolished by fiat, and the so-called "free proof" — namely, no system at all — was substituted. For centuries, lawyers and judges had evidenced and proved by the artificial numerical system; they had no training in any other, — no understanding of the living process of belief; in consequence, when "legal proof" was abolished, they were unready, and judicial trials have been carried on for a century past by uncomprehended, unguided, and therefore unsafe mental processes. Only in recent times, under the influence of modern science, are they beginning to develop a science of proof.

Such will be our own fate, when the time comes, if we do not lay foundations to prepare for the new stage of procedure.

The present work seems to be the first attempt in English, since Bentham, to call attention to the principles of judicial Proof (distinguished from Admissibility) as a whole and as a system.¹ It is therefore tentative. The chief service it aims to fulfill is to emphasize the subject as a science, and to stimulate its professional study.

The materials exist in abundance. But they need systematic collection and analysis. The illustrative materials here offered are culled from a wide range; though the search for them has merely touched the surface. A longer search would have found apter materials in many places, especially from the annals of civil trials. Most of the selections are from criminal cases; first, because they usually show the specific inference in more striking shape and shorter compass, and next, because they are the more profuse in the records. But it should not be forgotten that while blood and poison and pistol waddings are usually conceived as types of Circumstantial Evidence, yet the short and simple annals of civil cases are equally permeated with it, in less sensational form.

Now a few words about the use of the book.

1. It is intended mainly for law-school work. But it may profitably be used (we hope) for the self-training of the maturer practitioner.

2. Though most of the topics are introduced or followed (as befits a novel subject) by a brief expository passage, to focus the reader on the possibilities of the topic, yet the main part of the material may and must be used inductively. Some of it merely illustrates; but most of it calls for self-application of the process of analysis and inference.

¹ Mr. Burrill's masterly work, two generations ago, covered only a part of the field, Circumstantial Evidence. Mr. Moore's recent treatise (a valuable arsenal of extensive research), on *Facts, or The Weight and Value of Evidence*, deals in substance with Testimonial Evidence only. Mr. Justice Stephen's introduction to the Indian Evidence Act, entitled *The Principles of Judicial Evidence* (1872), contains a brief though thoroughly scientific survey of the subject; and perhaps his exposition should be classed as an attempt at a system. He seems to have believed that the logical Methods of Agreement and of Difference supplied the sufficient key to all such questions ("the principle is precisely the same in all cases, however simple or however complicated"). Inadequate though this may be deemed, certainly his point of view is so plausibly stated that it must be reckoned with in any future proposals of a system. The present exposition not being controversial, no attempt is made to note the objections to Mr. Justice Stephen's method.

On the Continent, the great pioneer work of Hans Gross, entitled (not happily) "Criminal Psychology" (translated in the Modern Criminal Science Series) is still the only systematic treatise on the psychology of testimony. However, not being written from the point of view of our law, its system is not directly available.

There is a probative moral to every one of the cases; to point out in footnotes the moral as conceived by the compiler would have spoiled the object of the book. The profitable use of the book will be to employ each illustrative case rigidly as a mental exercise somehow bearing on the subject where it is classified. In this field no one can afford to let another do his thinking for him.

3. There is no attempt to cover all kinds of evidential data. Many minor but troublesome varieties (for example, handwriting, hearsay, corroboration of witnesses) are ignored, partly because space did not permit, partly because their treatment might doubtfully complicate the system here offered. Some day a system will arise into which all of these can easily be fitted.

4. In the use of these materials, the following warning suggestions are offered:

(a) Do not attempt to invoke mentally any of those exclusionary rules of Admissibility commonly thought of as *the* rules of evidence. Keep them out of the ratiocinative process. Think of the problem as a juror would think of it if the evidence were safely in the case and the counsel were arguing to him about it. What we are aiming to analyze is the actual mind-to-mind process of persuasion and belief.

(b) Do not assume that any of the quoted extracts purporting to describe (especially in Part II) the facts of experience in various sorts of testimony are here put forward as sound. Give them such credence as their chroniclers may seem to deserve; but test them by your own experience, and apply such discount as may seem needed. Those materials are here offered merely *as* materials for reflection, and not as dogmas of truth.

(c) Use Parts I and II as simply preliminary, *i.e.* as a drill in method of analysis, and a supply of data of experience to supplement one's own. Then make Part III (Problems in Masses of Evidence) the main objective. Parts I and II are like the elemental moves or strokes in chess or in golf; they must of course first be studied; but the real thing is the game. Or they are like the various scales, arpeggios, and chords in music; they are the component parts, in varying form, for every one of a million pieces of music; but the musical piece is what we always expect ultimately to play or to hear. The single bits or kinds of evidence, as presented in Parts I and II, must first for exercitation be taken apart and analyzed, each by itself; but in judicial trials single kinds of evidence are not thus presented in segregated form. What is really found is a mixed mass of evidence, culminating in a single large issue (or series of issues): "Did he, or did he not?" "Was it, or was it not?" In Part III, and there only, we have the problem of Proof as it is actually forced upon us every day in our courts.

5. Part III thus represents the ultimate and most difficult aspect of the principles of Proof; namely, the *method of solving* a complex mass of evidence in contentious litigation. Such a method is here suggested (in No. 376). Nobody yet seems to have ventured to offer a method, — neither the logicians (strange to say), nor the psychologists, nor the jurists, nor the advocates. The logicians have furnished us in plenty

with canons of reasoning for specific single inferences; but for a total mass of contentious evidence, they have offered no system.¹ What is here put forward is a mere provisional attempt at method. One must have a working scheme. If this will not work, try to devise some other, or try what success there is in getting along without any.

The problems in Part III will offer a varied range for testing the practicability of whatever scheme one may devise. But *some* method there ought to be. It seems incredible that advocates can have got along without any, through the long period of judicial annals. What is wanted is simple enough in purpose, — namely, some method which will enable us to lift into consciousness and to state in words the reasons why a total mass of evidence does or should persuade us to a given conclusion, and why our conclusion would or should have been different or identical if some part of that total mass of evidence had been different. The mind is moved; then can we not explain *why* it is moved? If we can set down and work out a mathematical equation, why can we not set down and work out a mental probative equation?

In offering this collection of illustrations and problems as a help towards the attainment of this higher purpose, the Compiler realizes the inadequacy of his own contributions (mainly No. 376, herein) towards developing a sound and workable method. Yet, as Locke put it, "He that will not stir till he infallibly knows that the business he goes about will succeed, will have but little else to do but to sit still and perish." And there is at least the consolation of believing that the illustrations will furnish entertaining reading in a field little patronized hitherto by lawyers. And along with this entertainment ought to come some consciousness of the importance of the general problem, and a resolve to bring the Courts and the Bar to recognize the coming stage of the law of Evidence, — an epoch in which the present rules of Admissibility, already become too largely formalistic and unreal, will be partly supplanted by a new method.

¹ The feasibility of such a system has indeed been questioned in their ranks. Thus: "The theory of probabilities is the very guide of life; hardly can we take a step or make a decision of any kind without correctly or incorrectly making an estimation of probabilities. . . . Attempts to apply the theory of probability to the results of judicial proceedings have proved of little value, simply because the conditions are far too intricate. . . . No mathematical formulas can be framed to express the real conditions. . . . But such failures in no way diminish the truth and beauty of the theory itself; in reality there is no branch of science in which our symbols can cope with the complexity of Nature. . . . The difficulty, in short, is merely relative to our knowledge and skill, and is not absolute or inherent in the subject." (W. Stanley Jevons, *The Principles of Science: a Treatise on Logic and Scientific Method*, p. 34, 2d ed., 1877, reprint of 1907.) If anybody could have performed this service for Judicial Evidence, Jevons was the man to do it. His *Logical Abacus and Logical Machine* shows that he had the keenest appreciation of the possibilities.

Through the kind assistance of his colleague, Professor Horace C. Longwell, the present author has consulted the modern works on Logic, but must still avow that, for the purposes of judicial controversy, *they* do not afford the desired help.

GENERAL THEORY OF JUDICIAL PROOF

1. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹

§ 1. *Definition of Judicial Evidence*. It is of little practical consequence to construct a formula defining Judicial Evidence. That term represents:

Any knowable fact or group of facts, not a legal or a logical principle, considered with a view to its being offered before a legal tribunal for the purpose of producing the effect of persuasion, positive or negative, on the part of the tribunal, as to the truth of a proposition, not of law or of logic, on which the determination of the tribunal is to be asked.

Inference is the persuasive effect of each evidentiary fact, regarded separately, as to its Probandum.

Proof (or *Disproof*) is the persuasive effect of a mass of evidentiary facts, regarded as a whole, as to a Probandum.

§ 2. *Distinctions between Factum Probandum and Factum Probans*. Evidence is always a relative term. It signifies a relation between two facts, the *factum probandum*, or proposition to be established, and the *factum probans*, or material evidencing the proposition. The former is necessarily hypothetical; the latter is brought forward as a reality for the purpose of convincing the tribunal that the former is also a reality. No correct and sure comprehension of the nature of any evidential question can ever be had unless this double or relative aspect of it is distinctly pictured in each instance. On each occasion the questions must be asked, What is the Proposition (Probandum) desired to be proved? What is the Evidentiary Fact (Probans) offered to prove it?

Part of the confusion often found arises from the circumstance that each Evidentiary Fact may in turn become a Proposition to be proved, until finally some ultimate Evidentiary Fact is reached. For example, to prove the Proposition that a murder was committed by John Doe, the Evidentiary Fact may be offered that John Doe left the victim's house shortly after the murder; to prove this in turn, as a Proposition, the Evidentiary Fact may be offered that John Doe's shoes fit the track left near the house by the murderer; and this again, as a Proposition, may be evidenced by the statement of a witness on the stand who has placed the shoe in the tracks. Here each evidentiary fact in its turn becomes a proposition requiring the marshaling of new evidentiary facts, more or fewer according to its complexity. Any specific matter may be Proposition or Evidentiary Fact, according to the point of view of the moment.

§ 3. *Classification of Evidentiary Facts; Autoptic Proference*. There are two possible modes of proceeding for the purpose of producing persuasion on the part of the tribunal as to the Probandum. The first is by the presentation of the thing itself as to which persuasion is desired. The second is the presentation of some independent fact by inference from which the

¹ Adapted from the same author's *Treatise on the System of Evidence in Trials at Common Law* (1905, Vol. I, §§ 1-29).

persuasion is to be produced. Instances of the first are the production of a blood-stained knife; the exhibition of an injured limb; the viewing of premises by the jury; the production of a document. The second falls further into two classes, according as the basis of inference is (a) the assertion of a human being as to the existence of the thing in issue, or (b) any other fact; the one may be termed Testimonial or Direct Evidence, the other Circumstantial or Indirect Evidence.

The first mode above mentioned has been termed Immediate, or Direct, Real Evidence.¹ "Thus," says Mr. Best,² "where an offense or contempt is committed in presence of a tribunal, it has direct real evidence of the fact. So formerly, on an appeal of mayhem, the Court would in some cases inspect the wound, in order to see whether it were a mayhem or not. . . . Immediate Real Evidence is where the thing which is the source of the evidence is present to the senses of the tribunal." A preferable term is Autoptic Proference; this avoids the fallacy of attributing an evidential quality to that which is in fact nothing more nor less than the thing itself. With reference to this mode of producing persuasion no question of logic arises. "Res ipsa loquitur." The thing proves or disproves itself. No logical process is employed; only an act of sensible apprehension occurs, — apprehension of the existence or non-existence of the thing as alleged. Bringing a knife into court is in strictness not giving evidence of the knife's existence. It is a mode of enabling the Court to reach a conviction of the existence of the knife, and is in that sense a means of producing persuasion, yet it is not giving evidence in the sense that it is asking the Court to perform a process of inference,³ and it therefore gives rise to no questions of relevancy.⁴

Though the classes of things that can become the subject of autoptic proference are few, yet within those classes its use is common. In addition to jury views of land, the production of movables associated with a crime, and the exhibition of personal injuries, the perusal of documents is the most usual instance of its employment. Though a document is generally evidential only as being the assertion of its writer, yet when it becomes desirable and allowable to prove the terms of the assertion (*i.e.* when its existence becomes in itself a Probandum), it is obvious that we must either have some one tell about its contents, which would be using testimonial evidence, or must infer its existence circumstantially from some other fact, or produce the document itself for inspection, which would be Autoptic Proference.

§ 4. *Distinction between Circumstantial and Testimonial Evidence.* Aside from Autoptic Proference, then, all evidence must involve an *inference from some Fact (Probans) to the Proposition (Probandum) to be proved*. The kinds of inferences, with regard to the material taken as their subject, fall naturally into two great classes; or, rather, a single special class of evidentiary facts separates itself from the mass and calls for a distinct

¹ Mr. Bentham, in his *Treatise on Judicial Evidence* (tr. Dumont, London, 1825), p. 12, used "real evidence" to mean the inferences from a *res*; this of course is a different usage.

² Chamberlayne's *Best on Evidence*, 1893, §§ 196, 197.

³ It might be said that the Court is to use the fact of its sense perception as a basis of inference to a judgment; but this is a distinction which cannot be accepted in the law of evidence, because practically the Court recognizes none such and takes the results of its senses as immediate and full knowledge.

⁴ Of course, the knife might become the source of an inference, *e.g.* as to the nature of a wound; but in that aspect it is merely circumstantial evidence.

treatment, attended as it is with uniform and peculiar qualities affecting its probative features. That a separate treatment is inevitably demanded by these qualities has been long recognized in experience and acknowledged by jurists. This special class of facts is the assertions of human beings regarded as the basis of inference to the propositions asserted by them. This may be called Testimonial Evidence;¹ Direct Evidence is an alternative term sanctioned by usage, though not so satisfactory in theory. All remaining facts form a class known as Circumstantial Evidence.² The distinction has been thus stated:

Mr. THOMAS STARKIE. *Evidence*. (1824. I, 13.) Where knowledge cannot be acquired by means of actual and personal observation, there are but two modes by which the existence of a bygone fact can be ascertained: 1st, By information derived either immediately or mediately from those who had actual knowledge of the fact; or, 2dly, by means of inferences or conclusions drawn from other facts connected with the principal fact which can be sufficiently established. In the first case, the inference is founded on a principle of faith in human veracity sanctioned by experience. In the second, the conclusion is one derived by the aids of experience and reason from the connection between the facts which are known and that which is unknown. In each case the inference is made by virtue of previous experience of the connection between the known and the disputed facts, although the grounds of such inference in the two cases materially differ.

Sir J. F. STEPHEN. *Indian Evidence Act*. (1872. p. 38.) It will be found upon examination that inferences employed in judicial inquiries fall under two heads:

(1) Inferences from an assertion, whether oral or documentary, to the truth of the matter asserted;

(2) Inferences from facts, which upon the strength of assertions are believed to exist, to facts of which the existence has not been so asserted.

... This is the distinction usually expressed by saying that all evidence is either direct or circumstantial. ... The truth is that each inference depends upon precisely the same general theory. ... The judge hears with his own ears the statements of the witnesses and sees with his own eyes the documents produced in court. His task is to infer from what he thus sees and hears the existence of facts which he neither sees nor hears.

¹ The word "evidence" was until the middle of the 1700s used distinctively of testimonial evidence, — circumstantial evidence being either not reckoned with or else conceived of under the term "presumptions"; hence, in the trials of that period "an evidence" is used to mean "a witness": 1628, *Coke upon Littleton*, 282, b ("Evidence, *evidentia*: This word in legal understanding doth not only containe matter of record, . . . and writings under seale, . . . and other writings without seale, . . . which are called evidences, *instrumenta*; but in a larger sense it containeth also *testimonia*, the testimony of witnesses, and other proofes to be produced and given to a jury for the finding of any issue betweene the parties. And it is called evidence, because thereby the point in issue is to be made evident to the jury."); 1746, Lord Lovat's Trial, 18 How. St. Tr. 798; 1754, Canning's Trial, 19 *id.*, 478, 488, 514, 580.

² An earlier term for this class was "presumptive evidence." The distinction between "presumption" in the sense of a mere circumstantial inference and in the sense of a rule of procedure affecting the duty of proof has in modern times led to confusion. It may be noted here that the term is often met with in the sense of "inference," as applied to the probative value of ordinary circumstantial evidence, and as distinguishing it from testimonial evidence: 1810, Boyle, C. J., in *Davis v. Curry*, 2 Bibb, 239 ("Evidence, whether written or oral, is either positive or presumptive. Positive evidence is the direct proof of the fact or point in issue; presumptive evidence consists in the proof of some other fact or facts from which the point in issue may be inferred"); 1873, Gilpin, C. J., in *State v. Carter*, 1 Houst. Cr. C. 402, 411 ("When the existence of the principal facts is deduced inferentially by a process of sound reasoning from facts or circumstances proved and established in the case, it is termed presumptive evidence"; and he later uses the phrase "circumstantial or presumptive evidence").

In the grouping of Circumstantial Evidence difficulty has arisen from not keeping in mind that most circumstantial evidentiary facts must ultimately in turn become themselves a Probandum and be proved by testimonial evidence, and also from confining the latter term to assertions of some main fact in issue. For example, the finding of a bloody knife upon the accused after a secret killing is a circumstance from which an important inference may be drawn; yet this fact of the finding must be proved by some person's assertion; here the special rules of assertive or testimonial evidence must be applied in weighing the assertion, and the ordinary rules of circumstantial relevancy in weighing the fact of finding, assuming it as proved by the assertion. But this mixture of both kinds is not necessary and inevitable. At one extreme, as in a jury's view of a corpse or in a matter of judicial notice, we may have a circumstance given us as the basis of inference without the intervention of an assertion. At the other extreme, we may have assertions, as of the signing of a deed or of the perceived felonious abstraction of a bank note, directly positing the main probandum of the case, and needing no intervening inference, except from the fact of the assertion. But between these extremes lies the mass of ordinary evidence, for which at least two distinct steps of inference are required, — the inference from the fact of an assertion to the matter asserted, and then the inference from the matter asserted to another matter. Moreover, just as we may need even two or three inferences of the latter sort before reaching a main proposition of the pleadings, so (as in using hearsay) we may often need to use two inferences from assertions, — first from one assertion on the stand to the fact of the making of the extra-judicial assertion, and then from the latter to the truth of the matter asserted by it.

Now, so far as the principles of proof are concerned, it is apparent that it does not matter how we have come to our knowledge of these so-called "circumstances," *i.e.* things not assertions, — whether we get at them through believing assertions, or otherwise; what matters is the nature of the particular evidentiary fact in hand, whether it is assertive or circumstantial. In dealing with the probative value of the circumstantial class, we are to take the alleged circumstantial (or non-assertive) fact as assumedly proved, and then determine its effect. It is immaterial whether it has itself to be proved by testimony (as ordinarily) or by the tribunal's use of its own senses or existing knowledge (as occasionally). . . .

§ 5. *Special Characteristics of Legal Proof in General.* When a fact is offered as evidence, the very offering of it is an implication that it has some bearing on the proposition at issue, — that it tends naturally to produce a conviction about that proposition. The situation is thus in its elements the same as when the persons engaged are not occupied in a legal controversy. One might suppose that the question would be essentially one of the ordinary laws of reasoning, whether it were to be decided by a judge or jury, or by the audience of a lecturer, or by a policeman notified of an alleged misdemeanor in his district, or by a class in rhetoric. But the application of the laws of reasoning is here attended with peculiar considerations not existing for any investigation but a judicial one.

These features of legal proof have been emphasized, from different points of view, by some of the most original thinkers in the law of evidence :

Sir J. F. STEPHEN. *Indian Evidence Act.* (1872. p. 33.) The leading differences between judicial investigations and inquiries into physical nature are as follows: 1. In physical inquiries the number of relevant facts is generally unlimited, and is capable of indefinite increase by experiments. In judicial investigations the number of relevant facts is limited by circumstances, and is incapable of being increased. 2. Physical inquiries can be prolonged for any time that may be required in order to obtain full proof of the conclusion reached, and when a conclusion has been reached, it is always liable to review if fresh facts are discovered, or if any objection is made to the process by which it was arrived at. In judicial investigations it is necessary to arrive at a definite result in a limited time; and when that result is arrived at, it is final and irreversible with exceptions too rare to require notice. 3. In physical inquiries the relevant facts are usually established by testimony open to no doubt, because they relate to simple facts which do not affect the passions, which are observed by trained observers who are exposed to detection if they make mistakes, and who could not tell the effect of misrepresentation, if they were disposed to be fraudulent. In judicial inquiries the relevant facts are generally complex. They affect the passions in the highest degree. They are testified to by untrained observers who are generally not open to contradiction, and are aware of the bearing of the facts which they allege upon the conclusion to be established. 4. On the other hand, approximate generalizations are more useful in judicial than they are in scientific inquiries, because in the case of judicial inquiries every man's individual experience supplies the qualifications and exceptions necessary to adjust general rules to particular facts, which is not the case in regard to scientific inquiries. 5. Judicial inquiries being limited in extent, the process of reaching as good a conclusion as is to be got out of the materials is far easier than the process of establishing a scientific conclusion with complete certainty, though the conclusion arrived at is less satisfactory.

Professor J. B. THAYER. *Preliminary Treatise on Evidence.* (1898. pp. 271-275.) It is a proper qualification when we use the phrase *legal reasoning*; not because, as compared with reasoning in general, it calls into play any different faculties or involves any new principles or methods, or is the creature of technical precepts; but because in law, as elsewhere, in adjusting old and universal methods to the immediate purposes in hand, special limitations, exclusions, and qualifications have to be taken into account. . . . The peculiar character and scope of legal reasoning is determined by its purely practical aims and the necessities of its procedure and machinery. Litigation imports, for the most part, as we have seen, a contest, and adversaries. It has in it, therefore, a personal element, and it requires not merely a consideration of what is just in general, but of what is just as between these adversaries. It has often to be conducted with the aid of a tribunal whose peculiarities in point of number and of physical and mental capacity, and whose danger of being misled, must constantly be considered. It must shape itself to various other exigencies of a practical kind, such as the time that it is possible to allow to any particular case, the reasonable limitations of the number of witnesses, the opportunities for reply, and the chance to correct errors. It must adjust its processes to general ends, so as generally to promote justice, and to discourage evil, to maintain long-established rights, and the existing governmental order. The judicial office is really one of administration. . . . While these are some of the chief characteristics of legal reasoning, it will be noticed that they are only, in the nature of them, so many reasonable accommodations of the general process to particular subject matters and particular aims. Amidst them all the great characteristics of the art of reasoning and the laws of thought still remain constant. As regards the main methods in hand, they are still those untechnical ways of all sound reasoning, of the logical process in its normal and ordinary manifestations; and the rules that govern it here are the general rules that govern it everywhere, the ordinary rules of human thought and human experience, to be sought in the ordinary sources, and not in law books.

ALEXANDER M. BURRILL. *A Treatise on Circumstantial Evidence*. (1868. p. 94.) Between the results of judicial investigation of crime, and those of certain philosophical inquiries, there exist analogies worthy of consideration. Thus, they both have a common subject, — a past transaction, occurrence or event, which has had an actual, though merely transient existence; and they have a common immediate object, — the discovery of its cause; and, in the attainment of this object, they act upon the same general principle. But in all that relates to the particular mode and course of inquiry, and what may be called its external circumstances, the resemblance again fails, and further particulars of difference and contrast are found to present themselves. The most important of these will now be enumerated.

1. The philosophic inquirer deals with the particular cases which come under his observation, for the sake of, and with reference to some *general* truth to be eventually deduced from them. It is, moreover, a characteristic of the occurrences or events to which his attention is directed, that they are liable to be repeated in the same or nearly the same form, or happen again, under precisely similar circumstances. In fact, it is to the *recurrence* of a phenomenon, in some form or other, that he constantly looks forward, and upon it that he often confidently relies, either to complete his observations, or to verify and confirm their results.

But the cases with which the judicial investigator — the juror — has to deal, have not, in general, this quality or capacity of recurrence or repetition, in the same or similar forms. The same combination of circumstances which go to make up a case of crime, cannot, where they are at all numerous, be expected to occur again. And even if it could and did occur, it would answer no purpose; for it is the identical transaction which took place, and as it took place, which is to be the sole subject of inquiry. The investigator deals with the cases submitted to him, for their *own sake*, and for the express purpose of ascertaining the truth of every fact composing them; and not at all with reference to anything that may happen or be discovered in future. He looks exclusively to the past, as well for the facts from which he is to reason, as for the experience which enables him to reason accurately. His object is not to establish a general principle, but to ascertain the existence or non-existence of a particular disputed fact. Hence, the very first step he is obliged to take, is actually to revive and recall his subject. . . . It is in this peculiar process of revival and reconstruction, that the characteristic difficulties of judicial inquiry by means of circumstantial evidence, are found to consist, as may appear from the following further considerations.

2. In the majority of instances, the philosophical investigator combines with the character of inquirer, that of *original observer*, also. He has himself witnessed the occurrence, the cause of which he seeks to discover. He has observed the phenomena, not only once, but repeatedly, — observed them as they occurred, and with the utmost deliberation and precision, — observed them for the very purpose of deducing a result. His impressions of them are direct, and therefore of a corresponding perfection. If he ever relies upon the observations of others, it is only such as he has found to be worthy of confidence, because made with the same care that he himself would have bestowed; and even these he sometimes prefers to repeat, and thus to test by his own personal observation. He reasons and draws his conclusions confidently, because he *knows* the facts upon which they are based.

But with the juror, the case is different. He knows, or is presumed to know nothing of the transaction into which he is called to inquire. He has not witnessed one — even the most trifling — of its component circumstances. For his knowledge of each of them, in its character of a past event, he must rely on the observations of *others*. . . . Hence, his observation is of an indirect, dependent, and therefore inferior kind.

3. Again, the disadvantage arising from the last consideration is often increased by the intrinsic character of the *observations* themselves, as originally made by the *witness*. The philosophical observer either actually goes in search of his subject, or,

where it is suddenly presented to his view, arrests and keeps it before him, and in both instances, for the very purpose of examination. He observes with express reference to a specific object and result; and his predetermination always is that his observation shall be complete and correct to the minutest particular possible. . . .

But the observer of the facts and appearances which constitute, or are connected with criminal action, — especially of those which precede or accompany the commission of crime, — the observer who is to appear in the future character of a judicial witness, often acts under very different circumstances, and in a very different frame of mind. Many of the facts and appearances just mentioned (including frequently some of the most important materials of evidence) not only present themselves to the senses, incidentally, unexpectedly and transiently, but are, outwardly, and as they present themselves, of the most ordinary and familiar kind, having nothing on their face to attract or arrest attention in any considerable degree; and not to be distinguished from the great mass of facts and events which are constantly passing before the eyes of men, in their daily public intercourse with each other. Hence, where they are perceived merely by the organs of sense, without any act on the part of the observer, to give them connection with himself, they are usually perceived in a general and superficial manner. . . .

6. But supposing the facts fairly placed before the juror, by evidence to which no objection on the score of admissibility exists. They are, in the next place, to be put together; to be considered in connection; to be used in reconstructing the case. Assuming all those testified to, to have been reported accurately, to be, in short, the actual facts as they occurred, a new difficulty may arise. Some fact is seen to be wanting; it has not been proved. And some fact may be wanting, the absence of which is not noticed. . . . The philosophic anatomist may, by the aid of scientific rules, build up, with accuracy, an entire skeleton, from a single fossil bone. But the juror cannot supply a single fact; he cannot add one component element to the number of those which have been “retrieved” from the past; he cannot go a step beyond the evidence. . . .

7. The great characteristics of philosophical inquiry are deliberation and precision; and, as necessary conditions of these, mental, if not physical, abstraction, and unlimited *freedom* in every sense. We have seen with what undivided attention and laborious accuracy, the investigator in physical or astronomical science collects his facts. He observes and registers with the utmost care. He rarely, especially on a subject not before examined, attempts to draw a conclusion from a single observation, or set of observations. He observes and registers again and again. . . . In all this, he is under no sort of constraint. He is not necessarily confined to any particular place. He may retire into the most perfect seclusion, not admitting even the presence of his associates in inquiry; and he often adopts this course, to secure that mental composure which such investigations generally require. He is equally at liberty, in regard to time. He may decide now, a month or a year hence, as he may choose. He constantly postpones decision until he can reëxamine his facts, or confirm them by new observations. And where he does decide, he often does so *provisionally*.

But the juror, with his eleven associate inquirers after truth, finds himself under very different circumstances. The processes of collecting the facts, and deducing from them the inference desired, are, in his case, if not positively combined, at least so hedged in by the common limits of a single inquiry, as not to admit of separation for any practical purpose. . . .

But this is not all. From the moment the juror enters upon the business — with him, the duty — of inquiry, to the moment after his verdict is pronounced, he acts under the almost constant pressure of immediate personal constraint. From the moment he enters the court room, in obedience to the summons of the law, until discharged, he places himself under judicial control. He renounces, *pro hac vice*, his personal freedom. . . .

been admitted. Judges constantly find it necessary to warn us that their function, in determining Admissibility, is not that of final arbiters, but merely of preliminary testers, *i.e.* that the evidentiary fact offered does not need to have strong, full, superlative, probative value, does not need to involve demonstration or to produce persuasion by its sole and intrinsic force, but merely to be worth consideration by the jury. It is for the jury to give it the appropriate weight in effecting persuasion. The rule of law which the judge employs is concerned merely with admitting the fact through the evidentiary portal.

Mr. W. D. EVANS. *Notes to Pothier on Obligations*. (1808. II, 157; No. 16, § VI.) The general rules of law concerning the admission and sufficiency of evidence, and the particular conclusion which a jury may draw from the evidence before them in a particular case, are two things which, as I have already more than once observed, whilst they differ most essentially in their nature and principle, are very subject to be confounded, and which therefore in every discussion should be most carefully kept distinct.

TINDAL, C. J., in *Wright v. Tatham*. (1837. 7 A. & E. 407.) The judge who presides at the trial, by admitting this evidence, is not determining, nor has he any right to determine, the question of the [testamentary] competency of the testator. That is a question which the jury are to decide, after the termination of a long course of conflicting evidence. All that the judge has to determine is whether a particular piece of evidence is at a particular period of the cause admissible for the consideration of the jury as the matter then stands.

Proof, then, is obviously a distinct thing from Admissibility; because each evidential fact is offered separately, and we could not expect any one fact to produce demonstration. Since the production of evidential facts takes time, and one fact must precede another, we do not come to the question of Proof until all the evidence is in and the jury is ready to retire.

The principles of Proof, then, represent the natural process of the mind in dealing with the evidential facts after they are admitted to the jury; while the rules of Admissibility represent the artificial legal rules peculiar to our Anglo-American jury-system. Hence the former should be studied first. They bring into play only those reasoning processes which are already the possession of intelligent and educated persons. They familiarize the student with the materials most commonly presented in trials at law, and thus prepare him to take up more readily the artificial rules of Admissibility devised by judicial experience for safeguarding legal investigations of fact.

Moreover, this process of Proof is after all the most important in the trial. The trial culminates in either Proof or non-Proof. When the evidence is all in, the counsel sets himself to his ultimate and crucial task, *i.e.* that of persuading the jury that they should or should not believe the fact alleged in the issue. To do this, he must reason naturally, as all men reason and as juries reason. He must have familiarized himself with the logical processes which men naturally use and with general experience as to the classes of inferences commonly called for in legal trials. Here he has no use for the artificial rules of Admissibility. Those have been disposed of, at the outset, by the judge. The evidence is in, and the question now is, What is its effect? The study of the principles of Proof is thus an essential part of the lawyer's equipment in dealing with Evidence. All the artificial

rules of Admissibility might be abolished; yet the principles of Proof would remain, so long as trials remain as a rational attempt to seek the truth in legal controversies.

The proper order of study is therefore:

I. The Principles of Judicial Proof, as contained in logic, psychology, and general experience.

II. The Legal Rules of Admissibility.

The first of these is the subject of this volume. The second is the subject of the present Compiler's Cases on Evidence (2d ed., 1913).

2. JOHN H. WIGMORE, *Principles of Judicial Proof*. (1913.)¹

Modes of Inference and Proof. We thus take up first the inquiry: What is the logical form of inference or proof employed in the use of litigious evidence? And what are its standards or tests?

§ 1. *Form of Argument is Inductive.* The process of passing upon probative value is and must be based ultimately on the canons of ordinary reasoning, whether explicitly or implicitly employed. It is therefore necessary to review the distinction which Logic makes between the two great types of Argument² or Proof, — the Deductive and the Inductive forms. Modern Logic looks at this distinction without prejudice. Its tendency is to accept both types as capable of reduction to a single one. Nevertheless the distinction is a practical and substantial one, particularly in litigious proof. It is set forth with clearness and brevity by an eminent authority:

Professor ALFRED SIDGWICK. *Fallacies; A View of Logic from the Practical Side*. (1884. pp. 212 ff.) The real foundation of Proof is always the recognition of resemblance and difference between things or events known and observed, and those which are on their trial, — whether such recognition is based (1) on knowledge already reached and formulated in names or propositions or (2) on direct observation and experiment. (1) In proportion as we openly and distinctly refer to known principles (already generalized knowledge) is Proof *deductive*; (2) in proportion as we rapidly and somewhat dimly frame new principles for ourselves from the cases observed is Proof *inductive, empirical*, or (in its loosest form) *analogical*. . . . The whole history of the rise and growth of knowledge (it has been also already remarked) is a record of fruitful rivalry and interaction between two opposite processes. Observation of facts has demanded theory — statement of "laws" or uniformities — to explain, and even to name, the things and events observed; theory in its turn has always been more or less liable to purging criticism of "fact." . . .

Strictly speaking all Proof, so far as really *proof*, is deductive. That is to say, unless and until a supposed truth can be brought under the shadow of some more certain truth, it is self-supporting or circular. Unless we have some more comprehensive and better-tested generalization within the sweep of which to bring our Thesis, we reach no foundation broader than itself; no assurance beyond what may be derived from the fact that nothing has yet been found to contradict the theory. For two elements, express or implied, are required for all rationalization: (1) a Principle or abstract indication (an assertion that a certain sign is trustworthy); (2) an Application of such Principle, or an assertion that the sign is present in the case or cases contemplated by the Thesis. In other words all rationalization may be represented syllogistically. . . . Just as Explanation always demands a reference to some wider

¹ [This passage is adapted from the same author's *Treatise on Evidence* (1905. Vol. I, §§ 30-36).]

² "Argument" is here used in the logician's sense of a "proposed inference."

Generality than that which is to be explained, so Proof always demands a reference to some wider Generality than that which is to be proved. To explain and to prove consist essentially in this. Both are forms of "rationalization." But there is yet a meaning in the distinction [between inductive and deductive], and, with certain limitations and apologies, I propose to make some use of it.

Although the dependence of any Thesis on its Reason must be rationalized — *i.e.* must have the underlying principle made clear — before the testing operation can be called complete, yet in regard to special dangers it makes considerable difference whether that principle is at first definitely apprehended or not, — whether (as it is commonly expressed) the Proof professes to rely (1) upon laws known or supposed to be true, or (2) upon facts observed or supposed to be observed. We must distinguish, then, as far as possible, between that kind of Proof which rests *openly and distinctly* upon already generalized knowledge — Deductive Proof — and that which rests upon what may be loosely described as "*isolated facts*" or "perception of resemblance and difference" or "observation and experiment" . . . — that which is commonly known in its highest form as Inductive Proof, and in its lowest form as the Argument from Analogy. The required limitations in preserving the distinction appear to be, in the first place, a clear recognition that although in Induction the Principle or Law connecting the cases is in the case of *Inference* commonly dropped out of sight, or at least left highly indistinct, yet the whole cogency of Inductive Proof depends upon the extent to which such principle is first rendered definite and then confronted with observable or admitted fact. . . . The second difficulty in preserving the distinction lies in the fact that as a rule the Empirical and Deductive processes are found in combination, both being employed on the same subject-matter. . . . These two considerations make it of course extremely difficult in practice to label every argument at once with one or the other name. Sometimes, as where the Reason is a direct statement of the Principle itself, or again where it consists of a record of some experiment, no hesitation need practically be felt as to where the danger lies; but in a large number of cases we have no means of deciding whether the argument may best be classed as empirical or deductive or both. . . . But, because the distinction breaks down when pressure is put upon it, we need not consider it wholly worthless. It possesses a solid core of applicability, and if we can be content to use it as a rough guide in finding the weak point of an argument, much value may still be extracted from it in economy of time. . . . However we choose to name the two different kinds of arguments, the distinction between them has a certain real importance, as already shown; and all that is intended to be done with it is to recognize that so far as the given argument may be seen to belong to one or the other class, so far we are already on the track of special dangers.

A brief examination will show that in the offering of evidence in court the form of argument is always inductive. Suppose, to prove a charge of murder, evidence is offered of the defendant's fixed design to kill the deceased. The form of the argument is: "A planned to kill B; therefore, A probably did kill B." It is clear that we have here no semblance of a syllogism. The form of argument is exactly the same when we argue: "Yesterday, Dec. 31, A slipped on the sidewalk and fell; therefore, the sidewalk was probably coated with ice"; or, "To-day A, who was bitten by a dog yesterday, died in convulsions; therefore, the dog probably had hydrophobia." So with all other legal evidentiary facts. We may argue: "Last week the witness A had a quarrel with the defendant B; therefore, A is probably biased against B"; "A was found with a bloody knife in B's house; therefore, A is probably the murderer of B"; "After B's injury at A's machinery, A repaired the machinery; therefore, A probably acknowledged that the machinery was negligently defective"; "A, an adult of sound mind

and senses, and apparently impartial, was present at an affray between B and C, and testifies that B struck first; therefore, it is probably true that B did strike first." In all these cases, we take a single or isolated fact, and upon it base immediately an inference as to the proposition in question. This is the Inductive or Empiric process.

It may be replied, however, that in all the above instances, the argument is implicitly based upon an understood law or generalization, and is thus capable of being expressed in the deductive or syllogistic form. Thus, in the first instance above, is not the true form: "Men's fixed designs are probably carried out; A had a fixed design to kill B; therefore, A probably carried out his design and did kill B"? There are two answers to this. (1) It has just been seen that every inductive argument is at least capable of being transmuted into and stated in the deductive form, by forcing into prominence the implied law or generalization on which it rests more or less obscurely. Thus it is nothing peculiar to litigious argument that this possibility of turning it into deductive form exists here also. It is not a question of what the form *might* be, — for all inductive may be turned into deductive forms, — but of what it *is*, as actually employed; and it *is* actually put forward in inductive form. (2) Even supposing this transmutation to be a possibility, it would still be undesirable to make the transmutation for the purpose of testing probative value; because it would be useless. We should ultimately come to the same situation as before. Thus, in one of the instances above: "A repaired machinery after the accident; therefore, A was conscious of a negligent defect in it"; suppose we turn this into deductive form: "People who make such repairs show a consciousness of negligence; A made such repairs; therefore, A was conscious of negligence." We now have an argument perfectly sound deductively, *i.e.* if the premises be conceded. But it remains for the Court to declare whether it accepts the major premise, and so the Court must now take it up for examination, and the proponent of the evidence appears as its champion and his argument becomes: "The fact that people make such repairs indicates (shows, proves, probably shows, etc.) that they are conscious of negligence." But here we come again, after all, to an inductive form of argument. The consciousness of negligence is to be inferred from the fact of repairs, — just as the presence of electricity in the clouds was inferred by Franklin from the shock through the kite string, *i.e.* by a purely inductive form of reasoning. So with all other evidence when resolved into the deductive form; the transmutation is useless, because the Court's attention is merely transferred from the syllogism as a whole to the validity of the inference contained in the major premise; which presents itself again in inductive form. For all practical purposes, then, it is sufficient to treat the use of litigious evidentiary facts as inductive in form.

§ 2. *Practical Requirements of the Process, to constitute Proof.* The next inquiry is, What are the peculiar dangers of the argument, the loopholes for error, the opportunities for false inference? By ascertaining these, we shall learn what safeguards or tests ought to be applied by the jurors in weighing the evidence, and what opportunities of counterargument are offered to the opponent.

These peculiar dangers and necessities are thus set forth by the same eminent authority:

Professor ALFRED SIDGWICK. *Fallacies*. (1884. p. 270.) There is at bottom one primary source of fallacy in the inductive argument, call it by whatever name may be most convenient. We may name it, for instance, the *danger of overlooking plurality of causes*, or of neglecting possible chance or counteraction, or the possibility of unknown antecedents, or of arguing either "post hoc ergo propter hoc" or "per enumerationem simplicem," or of neglecting to exclude alternative possibilities, or of forgetting that facts may bear more than one interpretation, . . . or of failing to see below the surface, or—perhaps on the whole the best of all—of unduly neglecting points of difference. . . . [The form of argument is] a case or cases brought forward of which a certain conclusion is asserted to be the best explanation. If, then, some better explanation is possible, the theory as stated is impeachable. . . . By the "best" explanation is meant . . . that solitary one out of all possible hypotheses which, while explaining all the facts already in view, is narrowed, limited, hedged, or qualified, sufficiently to guard in the best possible way against undiscovered exceptions. . . . Hence, the "best" explanation of the facts A and B and C is that explanation which, while neglecting certain points of difference among them, and thus forming some generalization, neglects only those differences which are "unessential." The best explanation of (i.e. generalization from) one solitary sequence observed is that which neglects only its unessential elements or features. . . . It is in every case, then, through undue neglect of the essential difference between the specific case or cases observed and the wider genus to which the assertion professes to refer, that we rise to a generalization not sufficiently guarded against possible exceptions. . . . All positive proof depends . . . on the care, the precautions with which observation has been interpreted and experiment conducted. So far only as these exclude alternative possibilities are they of real value. . . . Because all positive assertion can only justify itself . . . when mistakes have been either one by one eliminated or in a body prevented, the burden of doubt to be removed by evidence consists essentially in the group of alternative theories remaining undiscarded. . . . The important point is, always, to show that all other possible theories are weighed in the balance and found wanting, — that is to say, that all precautions have been taken against that crudest kind of unchecked generalization which the least-trained mind possesses in the greatest abundance. This objection against a theory, that alternative theories are not yet discarded, appears, however, more directly applicable, more fruitful of results, against a concrete or an abstract-concrete thesis than against a directly abstract one. . . . And the right of the theory chosen, over all its possible rivals, depends entirely upon the depth of our insight into the conditions under which the experiment or observation was really made. This is the main lesson of Logic as regards Induction. . . . These alternatives have to be faced as possible explanations of each observed case; and the immediate question in each case is, What certainty can we obtain that the alternative chosen is the right one out of all those conceivable? The methods of Inductive Proof may be viewed as attempts to answer this question.

The peculiar danger, then, of Inductive Proof is that there may be *other explanations*, than the desired one, for the fact taken as the basis of proof.

Let us now examine this principle from the point of view of the opposing parties in a legal trial. Since our system of procedure is based on the method of leaving the production of evidence to the parties themselves, the proceeding is an antiphonal one. Both counsel and jury therefore need to examine each piece of evidence, first, from the proponent's point of view, next, from the opponent's point of view, and finally, from the jury's point of view.

Source: (1) with the inference to the Proponent of Evidence. If, then, the Inductive Proof is that the fact offered as the basis

Both counsel and jury therefore need to examine each piece of evidence, first, from the proponent's point of view, next, from the opponent's point of view, and finally, from the jury's point of view.

Source: (1) with the inference to the Proponent of Evidence. If, then, the Inductive Proof is that the fact offered as the basis

of the conclusion may be open to one or more other explanations or conclusions, the failure to exclude a single other rational hypothesis would be, from the standpoint of Proof, a fatal defect; and yet, if only that single other hypothesis were open, there might still be an extremely high degree of probability for the conclusion first claimed. When Robinson Crusoe saw the human footprint on the sand, he could not argue inductively that the presence of another human being was absolutely proved. There was at least (for example) the hypothesis of his own somnambulism. Nevertheless, the fact of the footprint was for his conclusion evidence of an extraordinary degree of probability. The provisional test, then, from the point of view of judicial Proof, would be something like this: Does the evidentiary fact point to the desired conclusion (not as the only rational hypothesis, but) as the hypothesis (or explanation) most plausible or most natural out of the various ones that are conceivable? Or (to state the requirement more weakly), is the desired conclusion (not, the most natural, but) *a* natural or plausible one among the various conceivable ones? After all the other evidential facts have been introduced and considered, the net conclusion can be attempted. At present, in dealing with each separate fact, the only inquiry is a provisional one: How probable is the Probandum as based on this Probans?

This general attitude may be illustrated from various sorts of evidentiary facts. (1) The fact that A left the city soon after a crime was committed will raise a slight probability that he left because of his consciousness of guilt, but a greater one if his knowledge that he was suspected be first shown. Here the evident notion is that the mere fact of departure by one unaware of the charge is open to too many innocent explanations; but the addition of the fact that A knew of the charge tends to put these other hypotheses into the background, and makes the desired explanation or conclusion — *i.e.* a guilty consciousness — stand out prominently as a more probable and plausible one. Even then there are other possible hypotheses — such as a summons from a dying relative or the fear of a yellow-fever epidemic in the city; but these are not the immediately natural ones, and the greater naturalness of the desired explanation makes it highly probable. (2) The fact that A before a robbery had no money, but after it had a large sum, indicates that he by robbery became possessed of the large sum of money. There are several other possible explanations, — the receipt of a legacy, the receipt of a debt, the winning of a gambling game, and the like. Nevertheless, the desired explanation rises, among other explanations, to a fair degree of plausibility. (3) The fact that A, charged with stealing a suit of clothes, was a poor man is offered to show him to be the thief. Now the conclusion of theft from the mere fact of poverty is, among the various possible conclusions, one of the least probable; for the conclusions that he would preferably work or beg or borrow are all equally or more probable, and the hypothesis of stealing, being also a dangerous one to adopt as the habitual construction to be put on poor men's conduct, has the double defect of being less probable and more hard upon the innocent. Such evidence, then, is of slight value to show that conclusion. (4) A person of unbalanced delusions asserts on the stand that he saw A strike B. Nowadays it is recognized that a delusion may affect the powers of observation and memory to a limited extent only, and may not concern the subject of

the testimony. If it does concern that subject, the hypothesis that the act occurred as he states it is too feeble and improbable, alongside of the hypothesis that his delusion is the only source of his statement. But if the delusion does not concern that subject, then his statement may prove something, even though it is still possible that his statement has been affected by the delusion. Thus the notion is, as before, that the evidentiary fact — *i.e.* the assertion on the stand — is of probative value so far as the correctness of the assertion is at least one among probable hypotheses. (5) The fact that A makes his statement on the witness stand in response to a leading question of his counsel is not of great value, because in experience the chances are so great that his answer is based on the counsel's suggestion and not on his own knowledge. On the other hand, where the leading question deals merely with the preliminary matters of his name, age, and residence, the answer is fairly probative because, there being so little motive for falsification on those subjects, the conclusion that he answered truly is far the most probable one. (6) The fact that A, the witness, has had a lawsuit with B, the defendant, is offered to show that A has feelings of animosity towards B which make it probable that he cannot testify correctly against him. Yet the inference of such animosity is a forced and unnatural one; the mere fact of a lawsuit is consistent with so many other more probable hypotheses that the evidence does not reach a great degree of probative value.

Thus, throughout the whole realm of evidence, circumstantial and testimonial, the theory of the inductive argument, as practically applied from the standpoint of Proof, is that the evidentiary fact has probative value only so far as the desired conclusion based upon it is a more probable or natural hypothesis, and the other hypotheses or explanations of the fact, if any, are less probable or natural. The degree of strength required will vary with different sorts of evidentiary facts, depending somewhat upon differing views of human experience with those facts, somewhat upon the practical availability of stronger facts. But the general spirit and mode of reasoning of the Courts substantially illustrates the dictates of scientific logic.

§ 4. *Same: Occasional Subordinate Tests; Method of Agreement and Method of Difference.* Thus, the main question for the inductive argument is (in the words of Professor Sidgwick, already quoted): "What certainty can we obtain that the alternative chosen is the right one out of all those conceivable?" But there have been stated by scientific logic several subordinate methods or processes of investigation which may be viewed as attempts to answer this question. Usually enumerated as five, they are reducible in essence to two, — the Method of Agreement and the Method of Difference. Occasionally they may be and are conveniently resorted to in the testing of judicial evidence.

(a) *Method of Agreement.* The canon which this applies may be thus stated: "Whatever circumstances can be excluded without excluding the phenomenon whose effect (or cause) is being sought, or can be absent notwithstanding its presence, are not causally connected with it. . . . The remainder, those circumstances which are not eliminated by this process, are supposed to be thus shown to be essential to the phenomenon, — to be the proved effect (or cause)." ¹ From the point of view of Proof, then, when we

¹ Sidgwick, *ubi supra*, p. 340.

argue that the observed instances of a , viz. a' , a'' , a''' , being always followed by b , prove a to be the cause of b , we can avoid the danger of ignoring other causes as the true explanation, by providing that the various instances shall be attended by identically the same circumstances or conditions; then, and then only, when a , under identically the same conditions, is followed always by b , have we the right to claim that b is the effect of a and not of some other cause. This subordinate test — which is merely a practical aid to the ultimate or fundamental one — will naturally be most available and useful where the evidential fact consists of a supposed parallel instance. To illustrate: (1) In showing that a person's illness was due to the eating of certain food, the fact is offered that other persons were ill after eating of the same food. Here the test naturally to be applied is whether the other illnesses occurred under substantially similiar conditions of time, surroundings, and symptoms. (2) To show that a portion of a pavement caused an injury because dangerous to passers-by, the fact is offered that other persons who passed fell down at that place. Here a similar test is called for. (3) To show that the accused wore a black hat, not a gray hat, the prosecution calls five different witnesses, all of whom were present, and none of whom were acquainted with each other. All agree that the hat was black. The conditions being substantially similar, the conclusion is highly probable. Judicial annals contain a vast variety of instances in which this same subordinate test is the natural one to be applied, and is in practice used by the Courts.

(b) *Method of Difference.* The canon of this method is: ¹ "If an instance in which the phenomenon under investigation occurs, and an instance in which it does not occur have every circumstance in common save one, that one only occurring in the former; the circumstance in which alone the two instances differ is the effect, or the cause, or an indispensable part of the cause, of the phenomenon." As applied to the judicial purposes of Admissibility, the test of this argument becomes: In order to prove that x is the cause of b , by the fact that wherever x was present the effect b , b' , b'' , was found, and that wherever x was not present the different effects c or d were found, the various instances b , b' , b'' , c , and d are admissible if they were substantially similar to each other in all respects except the presence of x . This test is of comparatively rare employment in circumstantial evidence, because it is rare that instances occur which fulfill this requirement, unless where prearranged experiments are possible. But in testimonial evidence, the argument may be and is employed. To illustrate: (1) The injury to the paint on the plaintiff's house is attributed by the defendant to sewer gas; for this purpose, from the fact that under conditions and circumstances as nearly as possible like those surrounding the plaintiff's house, except the presence of the sewer gas, he argues that the injury to paint did not occur. (2) The accused calls a witness to prove an alibi, who testifies that the accused at the time in question was in a certain saloon at 345 Fifth St., five miles away from the crime. The prosecution calls four other witnesses, all of whom say that they were in the same room at that time and the accused was not there. The accused's witness is his brother; the other persons are strangers. Here the fact of the accused's relationship and his witness' probable bias is the only circumstance different in his case from that

¹ Sidgwick, p. 345.

of the other four. Hence we may infer that this bias is the cause of his telling a different story from theirs.

The purpose in using both these subordinate tests is always the same general one, — to secure a fair probability for the claimed hypothesis, as against and in competition with other possible ones.

§ 5. *Same: (2) with Reference to the Opponent.* It is important to notice the double treatment of which every offer of evidence may admit. Where we are dealing with the general subject of Proof in Logic, the single inquiry is whether the argument offered as involving Proof does really fulfill the logical requirements. But wherever, in the applications of logical principles to specific practical purposes, two parties are found contending, the proponent and the opponent — as in a formal debate, a controversy of scientific investigators, and, preëminently, a trial at law — the mode of argument must be studied from the two points of view. Whenever, on the evidential fact offered by the proponent, a single other hypothesis remains open, complete Proof fails; the desired conclusion is merely the more probable, or a probable one; the other hypotheses, less probable or equally probable, remain open. It is thus apparent that, by the very nature of this process, a specific course is suggested for the opponent. *He may now properly show, by adducing other facts*, that one or another of these hypotheses, thus left open, is not merely possible and speculative, but is more probable and natural as the true explanation of the originally offered evidentiary fact. That fact has been admitted in evidence, but its force may now be diminished or annulled by showing that some explanation of it other than the proponent's is the true one. Thus every sort of evidentiary fact may call for treatment in a second aspect, viz.: What are the other hypotheses which are available for the opponent as explaining away the force of the fact already admitted? To illustrate: (1) In showing the defendant's connection with a murder, the fact is admitted of the finding of a knife, bearing his name, near the body of the deceased; the defendant, to refute the claimed conclusion that he was present with the knife at the murder, may show that he lost the knife a month before; thus giving greater color of probability to the hypothesis that some one else was present with the knife. (2) To show the defendant's animosity against the deceased, the fact of a serious quarrel ten years before is offered; the claimed conclusion, namely, that the animosity existed at the time of the killing, is an hypothesis of low relative probability; for the opponent may show, by the fact of a reconciliation in the interim, that the fact of the quarrel does not lead to the conclusion claimed. (3) To show the injurious vibrative qualities of a bridge in causing cracks in adjacent buildings, the fact of the existence of cracks in other adjacent buildings is received; this may be explained away by the fact that the operation of a railway, and not the bridge vibrations, had been their cause. (4) A witness may appear to have had adequate opportunity to observe accurately the facts related; but he may be mendacious by disposition, and if the opponent can show his bad character, it will tend to explain away all his assertions as those of a confirmed liar. (5) The rest of a conversation or writing, of which a part has been received, may be presented by the opponent to explain away the apparent effect of the fragment; thus, to adopt Algernon Sidney's famous illustration (frequently used by Erskine in his arguments for the accused in the sedition trials of the 1790s),

the prosecution, on a charge of blasphemy, might offer a statement of the defendant: "There is no God"; but this might be instantly explained away as being merely part of a quotation from the Bible of the passage, "The fool hath said in his heart, 'There is no God.'" Such is the complementary process of Explanation, by the opponent, as suggested by and related to the evidentiary fact received from the proponent.¹

§ 6. *Same: Occasional Subordinate Forms.* It has been seen that the proponent's evidentiary fact is occasionally subjected to subordinate tests, peculiarly useful in a few situations (*ante*, § 4). In the same way, the opponent, desirous of explaining away the force of an evidentiary fact by showing that another hypothesis is equally or more probable than the one claimed, finds that the process, just described in its common form, sometimes takes on a specific subordinate form peculiarly useful in certain situations. These forms, as noticed in judicial annals, seem to be practically three in number.

(1) *Explanation by Inconsistent Instances.* Where the proposition is that y is the effect of x , and the evidentiary fact is that in instances a , a' , and a'' , the circumstance y followed and the circumstance x was present, a convenient way of annulling the effect of these instances is to show that in a fourth instance a''' the circumstance x was present and yet the circumstance y did *not* follow.² To illustrate: In arguing that the vibrations of the defendant's railway bridge cracked the plaintiff's buildings at the eastern end, the injured condition of various buildings at that end is received for the plaintiff; to explain this away, the fact is probative for the defendant that at the western end the vibrations were even more severe, and yet no buildings there were cracked.

A chief use for this mode of argument is to demonstrate an alleged possibility or *impossibility*. When A's argument is that an event or deed x is possible or impossible, it is obvious that the whole force of his evidentiary facts is at once destroyed by a single instance of its impossibility or its possibility, provided the conditions are substantially similar in both cases. In this way the hypothesis originally set up as the exclusive one is shown not to be an exclusive one at all, by the fact that a contrary one has occurred in the instance offered by the opponent. A universal or absolute affirmative can be thus exploded equally as well as a universal or absolute negative. It is the universality of the alleged indication that lays it open to fatal attack by one inconsistent instance. To illustrate: (a) A burglar was alleged to have entered through a certain window; but the accused affirmed the impossibility of a man's getting through it; the prosecuting attorney suddenly put the frame over the defendant's head and drew it completely down, thus disproving the alleged impossibility; (b) at a trial for murder, there was testimony that the accused was seen going up a certain hill, wearing a pepper-and-salt suit, the witness looking from the rear and facing the sun; experiments showed that under such circumstances it was impossible for an observer to distinguish any color at all; (c) at a trial for arson, the prosecution claimed that the fire was set with a candle set in a closed box so as to

¹ The term "infirmative fact" was invented, to signify this class of facts here termed "explanatory," by Jeremy Bentham, and was afterwards adopted by Alexander Burrill (*Circumstantial Evidence*, 1868, p. 153).

² Sidgwick, *ubi supra*, p. 275.

burn down into a bunch of shavings; experiment showed that under the conditions alleged a candle would have gone out in a shorter interval than that which must have elapsed.

(2) *Explanation by Dissimilarity of Conditions.* Where the proponent's evidentiary fact has been admitted under the subordinate test of § 4, *ante*, — the substantial similarity of conditions in the instances offered, — the opponent's course is naturally suggested; *i.e.* he may show that there is at least a residuum of dissimilar conditions which diminish probative value, by making some other hypothesis a possible one, if not an equally probable one. To illustrate: (a) In arguing that arsenical wall paper was the source of the plaintiff's illness, the fact that others living in the same house were affected by similar symptoms is received; to explain this away, evidence is received that the same symptoms customarily attend the eating of unsound oysters, and that the others, but not the plaintiff, had eaten oysters; thus the dissimilarity of conditions is emphasized as the possible source of erroneous explanation. (b) To prove the qualities of a dental invention as a pain killer, the fact is received that the patrons of the dentist using it had suffered pain under other dentists but not under him; to explain this away, it may be shown that they had never been under him before he used this pain killer; thus emphasizing the dissimilarity of conditions to suggest that this dentist's personal skill, and not the invention, had prevented their pain.

(3) *Explanation by Cumulative Instances.* Where the proposition is that *y* is the effect of *x*, and the evidentiary fact is that in instances *a*, *a'*, and *a''*, the circumstance *y* followed and the circumstance *x* was present, another way of annulling the effect of these instances is to show that in a fourth instance *a'''* the circumstance *y* again followed, and yet the circumstance *x* was *not* present. This argument is in a manner the opposite of (1) *supra*, and consists in offering other instances in which the same effect is found, but without the presence of the alleged causing circumstance; and this forces us to look upon its presence in the proponent's original instances as merely accidental, and not really causative. The requirement of this argument is that the conditions of the additional instances shall be substantially similar in every respect except the alleged causing circumstance; for if they were not, then the elimination of the alleged cause as harmless is not accomplished. For example, the fact of the defendant's flowage of certain lands of the plaintiff is alleged to be the cause of deterioration in their productiveness during the previous ten years; to refute this, the defendant offers the fact of similar deterioration of other lands that had not been subjected to the flowage; this is probative only so far as the other lands are near by and presumably under the same influences of soil and climate.

§ 7. *Same: Other Methods of Rebuttal by the Opponent.* It must be understood, of course, that the opponent's modes of opposition are not confined to the process of Explanation. He has three processes in all. He may (2) *deny* the truth of the evidentiary fact itself; or (3) *advance some new and rival* evidentiary fact tending to prove his own Probandum. But in neither case is he using any new logical process. In (2) there is no form of argument at all, but a simple denial of the evidentiary fact; in (3) there is a wholly new argument, in which the opponent in turn becomes proponent and submits his material as proof, according to the ordinary tests. To

illustrate: To charge A with murder, the prosecution shows a specific threat, an old quarrel, and traces of blood on his clothes. The defendant answers: (1) *Explaining* away the old quarrel by showing an intervening reconciliation; explaining away the blood traces by showing the recent killing of a chicken; this is the complementary process of Explanation suggested by the evidentiary facts of quarrel and blood, and is directed to diminishing their force; this complementary process depends for its conditions and possibilities upon those original facts; (2) *Denying* the specific threat; this in itself does not affect the logical probative value of the threat as circumstantial evidence; it introduces an issue of evidence, raising a doubt as to the very existence of the circumstantial fact; (3) *Advancing the rival facts* of an alibi and of good character for peaceableness; here the defendant is simply a proponent of new evidentiary facts, just as the prosecution was for its own evidence; this new question of relevancy depends on precisely the same tests as the prosecution's original evidence.

All an opponent's modes are reducible to these three. In the first, he is an opponent by logical nature of his argument. In the second, he is an opponent from the contradictory point of view, but this may require him to become a proponent of either a new circumstance or a new witness. In the third, he becomes himself the proponent of a new argument, which the original proponent may now attack as an opponent. The first is inherent in the probative use of the proponent's original fact; the other two are not inherent, and may or may not be resorted to.

§ 8. *Summary of Probative Processes.* It has thus been seen that every evidentiary fact or class of facts may call for four processes and raise four sets of questions, which may be grouped as follows: (P) representing the proponent, and (O) the opponent.

(P) The first process, *Assertion*, consists in offering a fact tending to *prove* a specific conclusion or Probandum. This is subject to the test whether the claimed conclusion is a probable or a more probable one, having regard to conceivable other interpretations of the fact. This process we may label PA.

(O) The second process, *Explanation*, consists in *explaining away the original fact's force* by showing the existence and probability of other hypotheses; for this purpose other facts affording such explanations are receivable from the opponent. This process we may label OE.

(O) The third process, *Denial*, consists in *negating the original proponent's evidentiary fact* as such, either testimonially or circumstantially; and thus (O) as proponent offers a new witness or circumstance. This process we may label OD.

(O) The fourth process, *Rivalry*, consists in adducing a new fact, circumstantial or testimonial, which by a *rival inference* tends to *disprove* the proponent's Probandum. This process we may label OR. Here the opponent becomes in turn a proponent, and the fact offered by him is now open to the same processes as above from the original proponent, viz.: OE, OD, and OR.

Such are the forms of probative processes available for each single fact as offered. For each additional new fact the processes may be repeated, though they may not be actually used in each instance.

The following outline will illustrate the application of the processes to a

single offered fact of each variety, circumstantial and testimonial. The sign \longrightarrow signifies "tends to prove"; the sign \rightarrow signifies "tends to disprove"; the sign $<$ signifies "explains away"; letter T stands for a testimonial evidential fact; letter C stands for a circumstantial evidential fact:

Circumstantial Evidence Processes:

Probandum: X stabbed Y with a knife at a certain time and place.

PA (Proponent's Evidential Fact) C = Bloody knife was found on X \longrightarrow Probandum.

OE (Proponent's Evidential Fact explained by Opponent)

C = X drew it from the wound after the affray on coming to Y's assistance $<$ Proponent's Evidential Fact.

OD (Proponent's Evidential Fact denied by Opponent)

C = Bloody knife was not found on X \rightarrow Proponent's Evidential Fact.

and this the opponent may do either

(1) by adducing new evidential facts

T = M's assertion that on searching X no knife was found.

C = No trace of blood appeared on X's garments by the knife.

(2) or by questioning the inference from the T or C on which PA itself rested as a probandum.

OR (Rival New Facts adduced by Opponent)

C = X had no quarrel or other motive to stab Y \rightarrow Probandum.

and T = N a bystander asserts that X did not stab Y \rightarrow Probandum.

In the above instance, OE is of course inconsistent with OD; and in this particular case the two processes would not be employed together in the above manner. Note also that under OE, OD, and OR, alike, new T and C will ramify into further details; yet the processes will always be one or more of these three.

Testimonial Evidence Processes:

Probandum: X an automobilist was carrying a light at the time of a collision.

P (Proponent's Fact)

T = M's assertion that a light was being carried by X at the time \longrightarrow Probandum.

OE (Proponent's Fact explained by Opponent)

C = M is X's chauffeur and is therefore biased $<$ Proponent's Evidentiary Fact.

OD (Proponent's Fact denied by Opponent)

(This is not here feasible except as stated below.)

OR (Rival New Facts adduced
by Opponent)

C = After the collision, no acetylene was found in X's lamp \rightarrow Probandum.

T = N a bystander asserts that *no* light was carried \rightarrow Probandum.

In the above instance, the process OE is commonly termed Impeachment of the Witness, in legal phrase, and includes all methods of detracting from the force of the witness' assertion, by showing it to be untrustworthy. The process OD, it will be noticed, is not ordinarily feasible for testimonial evidence, because, when the witness is testifying in court, the fact of his making the assertion cannot be disputed. Yet even then the opponent may induce him on cross-examination to retract the assertion; which would be the process OD. Moreover, when the witness is not in court, and his making of the assertion is proved by hearsay, its making may be disputed by the opponent; which would be another instance of the process OD.

For testimonial evidence, therefore, as well as for circumstantial evidence, the available processes are four in all. Their distinction is due to the fact that separate methods of reasoning are involved in each.

The *jury's point of view*, in estimating the total effect of the mass of evidence, will be examined *post* (No. 376), after the various kinds of evidential facts have been studied in detail.

§ 9. *Analysis of an Evidential Fact.* From the foregoing exposition of the kinds of evidence and processes of probative reasoning, it will be seen that the essential thing, in preparing to estimate the effect of evidence, is to *analyze accurately the inference proposed* in each instance. Every evidential fact is offered as tending to prove a Probandum. We know that in most instances it will not completely prove. Therefore it is necessary to place it in the light and dissect it to see what are its shortcomings. For practical purposes this analysis has four steps.

The *first step* is to state to ourselves, in words, precisely what the offered evidence is, and then precisely what is its supposed Probandum. Until this is done, it is useless to go further. For example, a policeman tells his story about capturing the accused after an affray. Out of that story we may select two or three supposed facts; *e.g.* (1) that the accused had no hat, and (2) that his hand was cut. This (1) first supposed fact we may then analyze into the inferences as alleged or implied by the proponent; *e.g.*

C — The fact of having no hat \rightarrow P — it was lost by running;

C — The fact that he lost it by running \rightarrow P — he was running away;

C — The fact that he was running away \rightarrow P — his consciousness of guilt;

C — His consciousness of guilt \rightarrow P — his actual guilt of the assault charged.

Now at any one of these four steps a lack of certainty in the inference may become important; whether and just where the doubt will become important will depend upon the opponent's attitude in the case in hand.

The (2) second supposed fact we may analyze thus :

- C — The fact of having a cut hand —→ P — the recent contact with a sharp weapon ;
- C — Recent contact with a weapon —→ P — contact with the weapon used in the affray ;
- C — Contact with the weapon used in the affray —→ P — taking part in the affray.

Here, too, there is an opening for dispute as to the successive inferences. The analysis enables us to estimate the strength of the final inference, and to prepare for the various possibilities of dispute at any possible point.

The *second step* is to set down, in words, precisely, what the opportunities are for the opponent to explain away the inference at any one of the successive stages, and to estimate the probabilities of any one of them being more correct, in the case in hand, than the one constituting an inference towards our own probandum. Thus, in the first instance above taken :

- C — the fact of having no hat, may be explained by four other inferences : —→ Hat was blown off by a gust of wind ;
- or —→ Hat was already off when the accused came out of his store to learn the cause of the commotion ;
- or —→ Hat was off because the day was hot ;
- or —→ Hat was off because he never wore one.

One or more of these explanations may be absurd ; but the necessary process is first to set them down in black and white and label them according to their probability.

Again, in the next step of inference, assuming that the proponent's inference is sound, nevertheless —

- C — The fact of losing the hat by running, may be explained thus : —→ He was running to board a street car ;
- or —→ He was running to give an alarm of fire ;
- or —→ He was running to evade a third person.

Any one of these may be improbable ; but the needful thing is to determine explicitly whether it is or not.

The *third step* is to set down, in words, precisely, what the possibilities are for the opponent in dealing with the above evidential facts. Thus, C — the fact that the accused when arrested had no hat, may be (OE) explained away, (OD) denied, or (OR) rivalled. (OE) It may be explained away by one of the above suggested inferences as the true one. (OD) It may be denied, by another witness who contradicts the policeman's asser-

tion, or by the circumstance that the accused still had his hat a few minutes later. (OR) It may be rivalled, by the circumstance that the accused had no motive for making an assault. — Whether the opponent will explain, or deny, or adduce rival facts, cannot be told beforehand; but the directions which his refutation may take, must be thought out beforehand and prepared for.

The *final step* consists in the analysis of the effect of a mass of evidential facts. This is something larger than the analysis of each separate fact, and involves additional canons of reasoning (*post*, No. 376).

The main subject of study will therefore be the *various kinds of specific evidential facts commonly offered in litigation*, and their *possibilities of inference*.

The instances taken from the chronicles of litigation will illustrate these varied possibilities. The exercise gained from their analysis will be the essential value of the work to the student.

The material may best be taken up under three heads:

Part I. Circumstantial Evidence;

Part II. Testimonial Evidence;

Part III. Problems involving a Mass of Evidence of Both Kinds.

PART I: CIRCUMSTANTIAL EVIDENCE

3. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹

Classification of Circumstantial Evidence. Two important considerations affect the classification of circumstantial evidence for convenient treatment.

(1) The starting point of the classification should be the proposition desired to be proved (Probandum), rather than the evidentiary fact offered. The fundamental inquiry whether the claimed conclusion is a probable inference from the offered fact. Now if we take a specific probandum as the starting point, and ask in turn, whether it is relevantly evidenced by fact *a*, fact *b*, fact *c*, and so on, we are able to compare intelligently, without repetition, the various sources from which the conclusion or proposition is capable of being inferred.

(2) A second consideration is that we are here dealing, not with a general scheme of human life or of modes of proof, but with a limited body of rules brought forth by problems laid before the Courts for adjudication. Not every species of evidentiary fact or of inference is brought into the realm of judicial evidence, but chiefly certain common and frequently recurring matters affecting the usual crimes and civil disputes.

With these considerations in mind, the general grouping of Probanda may be made as follows :

- I. An Event, Quality, or Condition of Physical (Inanimate) Nature ;
- II. The Identity of a Thing or Person ;
- III. A Quality or Condition of a Human Being ;
- IV. The Doing of a Human Act.

Further, under each group, it will be often convenient to arrange the evidentiary facts according as the proof or indication they afford is :

- A. Prospectant ;
- B. Concomitant ; or
- C. Retrospectant.²

The distinction between the first and the third heads is always marked and often useful in hints. For instance, under Group IV, above, the evidentiary facts of Character, Plan or Design, Motive, point forward to a future act ; *i.e.* we take our stand before the time of the act, and argue that because of the person's character, design, or motive, he was likely, or not, to do the act in the future ; while the fact of Consciousness of Guilt points backwards, *i.e.* we infer from his state of mind that he has been guilty of some crime in the past. In evidencing matters under Group III, this distinction

¹ Adapted from the same author's *Treatise on Evidence* (1905, Vol. I, § 43).

² It is perhaps worth noting that this analysis was long ago hinted at by Burke, in his disquisition on evidence in the Report on Warren Hastings' Trial, in 1794 (31 Parl. Hist. 342) ; "every circumstance," he remarks, "precedent, concomitant, and subsequent, become parts of circumstantial evidence." Mr. Burrill's treatise on Circumstantial Evidence also uses the same classification.

becomes also useful; *e.g.* the fact of hereditary insanity as pointing forward to a defendant's insanity raises a question of relevancy essentially different from that raised by evidence of abnormal conduct exhibited by him; so also in proving an emotion or passion (motive), evidentiary circumstances such as family relationship, need of money, and the like, are offered as pointing forward to the probability of such an emotion being excited, while outward exhibitions of conduct, used for the same purpose, have a retrospectant value as showing that the emotion was the probable source of the evidentiary conduct. This distinction, then, while not always an essential one, at least provides a convenient order of arrangement, and is often serviceable in emphasizing related qualities of probative value.

**TITLE I: EVIDENCE TO PROVE AN EVENT, CON-
DITION, QUALITY, CAUSE, OR EFFECT OF
EXTERNAL INANIMATE NATURE**

4. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹ § 1. *Classification of Probanda*. There can be, at certain points, no sharp distinction between a Human Act, a Human Quality or Condition, and a Physical Fact (External Inanimate Nature), with reference to evidencing them as probanda. Some matters, such as death, may sometimes be viewed in either the first or the second aspect; for other matters, such as the possession of land, it may not be easy to distinguish between the second and the third. The propositions which come to be proved before tribunals of justice embrace every sort of fact in life, and no classification not purely arbitrary can divide them for practical purposes into classes always absolutely distinct.

But in the present group the distinguishing feature is the absence of the element of a human will and of the human emotion, reason, and character as affecting conduct.

The kinds of probanda may be further subdivided into four categories:

I. Identity (for example, whether a machine delivered was the same as the one agreed to be delivered);

II. Occurrence of an Event (for example, whether a tree fell, or whether lightning struck a house);

III. Existence, or Persistence, in Time (for example, whether a defect in a street or a house was in existence at the time in issue);

IV. Tendency, Capacity, Quality, Cause, or Effect (for example, whether a place in a sidewalk was dangerous, or whether a gunshot could carry a certain distance).

Here, again, no specific single terms can accurately distinguish the different groups, nor is it possible always to draw the lines sharply between the various groups. A given evidentiary fact may and usually does involve (as already observable in dealing with the other materials) more than one of these processes of inference. For example, in proving a sidewalk hole to be unsafe, the evidence may be that A fell there two weeks ago; this involves, first, an inference in the fourth group, namely, that the place was then unsafe,

¹ Adapted from the same author's *Treatise on Evidence* (1905, Vol. I, §§ 432-461).

and, secondly, an inference in the third group, namely, that its unsafeness two weeks before evidences its unsafeness at the time in issue; and either of these inferences may be rejected as unsound, while the other remains sound. Again, to prove the identity of a bale of goods delivered, its features six months before may be offered; and this involves the soundness of two inferences, one of the first and one of the third sort. Again, the question being whether a tree was lying across a street on January 1, the evidentiary fact that the tree was struck by lightning on July 1 preceding involves two inferences, namely, that the tree fell when struck, and that its fallen condition continued till the time in question, *i.e.* an inference of the second and one of the third sorts. Again, to show that a dust explosion occurred in a certain room, the evidentiary fact that a dust explosion previously occurred in the same room involves two and perhaps three inferences, — first, that there is a tendency in a room thus circumstanced for the dust to explode spontaneously, secondly, that as a result of this tendency an explosion did occur, and perhaps (intervening between these two), thirdly, that the condition at the previous time continued up to the time in question, — inferences, respectively, of the fourth, the second, and the third sorts.

In spite, however, of this incidental resort to two or more of the kinds of inference in one piece of evidence, the kinds of inference, as types, remain distinct.

§ 2 (I). *Identity of One Object with Another.* The mode of inference used in proving identity is precisely the same for objects of inanimate nature and for human beings and will be examined *post*, No. 14.

§ 3 (II). *Occurrence of an Event.* This term includes theoretically matters which might perhaps be conceived of also under the category of Existence. For example, if the probandum be the destruction of a house, it might ordinarily be conceived of either as an event, the momentary fact of destruction, or as a condition of existence, the state of being destroyed.¹ For practical evidential purposes, however, the choice of terms is here not important. The distinction between the second and the third groups is the distinction between the *mere* fact of occurrence or existence *as such*, and the fact of occurrence or existence with reference to *time*. In the present group it is asked how to prove the mere fact of destruction or non-destruction.

§ 4. *Same: Occurrence of an Event, as evidenced from Cause or Effect.* An event may be evidenced circumstantially by a cause or by an effect. This mode of inference is available in the three forms already mentioned (*ante*, No. 2), — Prospectant, Retrospectant, and Concomitant. For example, the sinking of a ship is evidenced prospectantly by the presence of a storm in the vicinity; the occurrence of a fire is evidenced retrospectantly by the blackened ruins left as its traces; the revolution of car wheels is

¹ "When successive phenomena are in question, these abstracted portions [*factum probandum* and evidentiary fact] may always themselves be viewed as events, even where so uneventful as hardly to deserve the name in popular language. Thus, where any quality of anything changes ever so slightly — say, when a thermometer rises one degree — we have what is here considered an 'event.' . . . It may seem [in these examples] strange to call a large river or a large town 'events,' but here the names are only used elliptically, for the growth of the town and the continued existence of the river." (Sidgwick, *Fallacies*, pp. 333, 338.)

evidenced concomitantly, by the motion of the car, to the person riding in it. This type of inference, though perhaps in practice the commonest of all, gives rise, nevertheless, to practically no judicial problems. One reason for their rarity is that, for the occurrences of external or inanimate nature, testimonial evidence is commonly abundant. Another reason is that, where the desired inference transcends the scope of ordinary instinct and experience, it is offered as the subject of a testimonial knowledge or opinion by an expert witness, — as where a physician testifies that froth in the lungs of a corpse evidences a certain kind of death. Another reason is that most events of external nature are associated with some human act, and hence the proof involves evidence of the act. But a reason the most important for present purposes is that an inference of this type, though in form the first one to be put forward as the main inference, frequently — if not usually — resolves itself into another of a different type, and the evidential question comes to turn upon the other. This feature it is necessary to explain more fully. The process may be examined for each of the three modes of inference in turn, — prospectant (inference from a prior or causal fact), retrospectant (inference from an effect), and concomitant.

(1) *Prior Cause, as the Basis of Inference.* That a corporal injury will cause a permanent disability to work; that noxious fumes will cause the destruction of herbage, — these are examples of this sort of inference. The evidential offer may be put in this way: The fact of noxious fumes is offered as evidence that at a future time there will ensue no herbage. But, in practice, these offers involving an argument from cause to effect do not raise any evidential questions in the above form, but resolve themselves into others; because the inference rests on an important assumption, which in its turn becomes the subject of a new evidential question. To take the second illustration above, and state it more accurately: The fact of these fumes *having a tendency* to destroy herbage evidences that in future they will probably result in destroying the herbage in question. Now this form of statement brings out the necessity of proving, in its turn, a fact of a new and different category, viz. this assumed *tendency of the fumes to destroy herbage*; and this fact of *tendency* (or capacity) is seen to be in reality the probable point of controversy.

(2) *Subsequent Effect, as the Basis of Inference.* That the falling barometer indicates the existence of an atmospheric disturbance; that the derailed car indicates the prior occurrence of a collision or other destructive event, — these are instances of inferences from effect back to the existence of a cause. Such inferences, however, rarely raise evidential questions in practice, for reasons the same as those just explained. Thus, in the illustration above used, the destruction of the herbage is evidently relevant, without question, as indicating the same destructive influence of atmosphere, soil, or the like; but in the further process of fixing on the fumes in question as the precise cause, either we proceed to offer that specific inference through an expert witness, who asserts as a matter of professional experience that the appearance of the herbage indicates specific fumes as the source (in which case no questions of circumstantial relevancy arises), or, in attempting otherwise to fix upon the fumes as one of the probable destructive influences, it must first be shown that they have this *tendency* to destroy herbage. Thus, in general, the inference from an effect to the existence or

operation of a cause usually leads to a new controversy as to whether the supposed cause has any causing tendency of the alleged sort, and this new controversy involves a different sort of inference.

(3) *Concomitant Events, as the basis of Inference.* An event cannot be inferred from its concomitant event except on the assumption that they have a common cause, or unless the inference is really not one of concomitancy, but of cause and effect. An example of the latter sort is the inference of fire from smoke, *i.e.* it is really the inference of fire as a cause from smoke as the effect. An example of the former sort is the inference of revolving wheels from the motion of the car, *i.e.* there is really an inference, first from the motion to the motive power as a cause, and next, from the motive power to the revolution of the wheels as a common effect of the same cause. Hence, no separate problem is involved in this form of argument.

§ 5 (III). *Existence (or Persistence) in Time.* There is, in strictness, no place for a separate category of mere Existence, as distinguished from Occurrence; for, as above suggested, the notion of a thing's either coming into being or of its having been in being is an inclusive and single notion, with reference to which inferences from cause or from effect may equally be made. Thus in inferring future disability from corporal injury, it is immaterial whether the former be termed the occurrence of an event or the existence of a condition; the inquiry is merely how far we may infer towards it from something else as its cause or its effect; and the term Occurrence has therefore been employed as the one most generally applicable to the probandum. Nevertheless, it is convenient to separate, for some purposes, a category of Existence in Time as the probandum, *i.e.* those instances in which the Existence in Time of an object, condition, or quality is to be evidenced by a prior, subsequent, or concomitant existence. The inference may, as usual, be of one of these three general types; but the first two are not dissimilar in their operation, and may be considered together.

§ 6. *Same: (1) Existence, from Prior or Subsequent Existence; General Principle, applied in Sundry Instances (Highways, Machines, Buildings, Railway Tracks, etc.).* When the existence of an object, condition, quality, or tendency at a given time is in issue, the *prior existence* of it is in human experience some indication of its probable persistence or continuance at a later period. The degree of probability of this continuance depends on the chances of intervening circumstances having occurred to bring the existence to an end. The possibility of such circumstances will depend almost entirely on the nature of the specific thing whose existence is in issue and the particular circumstances affecting it in the case in hand. That a soap bubble was in existence half an hour ago affords no inference at all that it is in existence now; that Mt. Everest was in existence ten years ago is strong evidence that it exists yet; whether the fact of a tree's existence a year ago will indicate its continued existence to-day will vary according to the nature of the tree and the conditions of life in the region. So far, then, as the *interval of time* is concerned, no fixed rule can be laid down; the nature of the thing and the circumstances of the particular case must control.

Similar considerations affect the use of *subsequent existence* as evidence of existence at the time in issue. Here the disturbing contingency is that some circumstance operating in the interval may have been the source of

the subsequent existence, and the propriety of the inference will depend on the likelihood of such intervening circumstances having occurred and been the true origin. On landing at New York it can hardly be inferred that the steamer at the next dock has been there for a week; but it may usually be inferred that the dock has been there for some years; while the particular circumstances of appearance and the like will in the last instance affect the length of time to which the inference could be carried back. Here, as with prior indications, the *interval of time* to which any inference will be allowable must depend upon the nature of the thing and the circumstances of the particular case.

The opponent, on the principle of *Explanation* (*ante*, No. 2, § 5), may always attempt to explain away the effect of the evidence by showing that in the meantime other circumstances have occurred to raise a probability of change instead of continuance.

The precedents show the principle applied to all manner of subjects, — to the condition of a highway, or of a bridge, or of a railway track, station, or roadbed, or of a stream, or of premises, without or within, or of machinery and apparatus, or of a stock of goods, or of sundry articles, or of the condition of a human body or of an animal. These applications of the principle are analogous to the use of the same inference in evidencing, from prior or subsequent condition, a human quality, — habit, possession, ownership, partnership, and solvency, emotion, physical capacity, insanity, and character. In the proof of a place or person by photographs, the principle is frequently applied.

§ 7. *Same*: (2) *Existence, from Concurrent Existence; the Whole evidenced by the Parts, etc. (Highways, Railway Tracks, Premises, etc.)*. The process of thought by which one thing *concurrently* indicates another rests on the assumption that in human experience the one is likely to be found associated with the other. This assumption, then, in one form or another, must underlie any attempt to evidence the latter by showing the concurrent existence of the former. For practical purposes the situations may be grouped under three heads.

(a) *Miscellaneous Instances*. That the presence of smoke indicates the concurrent presence of combustion; that in coming upon sea water in its natural place we are likely to come upon fish; that on apple trees fruit is likely to be found in season, — these are illustrations of the form which this inference most usually takes. This form, however, is but superficially a concurrent indication; almost every apparent inference is in reality a prospectant one, *i.e.* from cause to effect. That apple trees are likely to produce apples; that fire is likely to produce smoke, — such are the true forms of these arguments upon analysis. There are few, if any, genuine instances of concurrent argument of this sort.

(b) *Existence of the Whole inferred from a Part, or of one Part from Another*. To argue to the whole from a part, or to one part from another, is also, in the last analysis, an argument from one effect of a common cause to another effect. But for practical purposes it is sufficient to treat the inference as an immediate one. The condition of the inference's propriety is that in human experience the whole has been found probably to exist with certain related parts; we may then use the existence of one of the parts as evidence from which to infer the presence of the whole or of one of the associated parts,

— as where, observing a floating iceberg, it is inferred that beneath the water's surface is a larger mass of ice in the proportion usually found associated with such a mass above water; or where on observing, from one side of a locomotive, two driving wheels, we infer that on the other side there are two similar ones. This sort of inference is common enough in trials.

(c) *Condition or Quality in one Place, from Condition or Quality in Another.* Logically of the same nature as the preceding, but in practice having a slightly different aspect, is the inference frequently desired to be made from the nature of a condition or quality in one place to the condition or quality at another place, usually in the vicinity. The logical assumption is that by a common cause or causes uniform effects have been produced over a given area, which is thenceforth related to the evidential place as a homogeneous whole to its parts. In practical application, therefore, the requirement is that the two places should be so related that they probably form parts of a homogeneous area including them both; and in such case the condition or quality of the one place is probative to show the condition or quality of the other. This principle receives frequent application, — to highways, to railway tracks, stations, and roadbeds, to machines, buildings, and other structures, to natural growths and formations, weather conditions, and the like.

§ 8. *Same: Samples as Evidence of an Entire Lot.* It is on the present principle that a sample is receivable in evidence to show the quality or condition of the entire lot or mass from which it is taken. The probative requirement is merely that the mass should be substantially uniform with reference to the quality in question, and that the sample portion should be of such a nature as to be fairly representative. When the sample is not taken from the very substance or article in issue, but from another one, the only difference in the argument is that another inference is introduced, *i.e.* the inference of Identity (*post*, No. 14). It must first be evidenced that substance A is in nature identical, for the purpose in hand, with substance B, and then a sample from B, working through a double inference, evidences the nature of substance A.

§ 9. *Same: Sample Copies of Printed Matter.* An impression from type (usually known by the unfortunate because ambiguous term *copy*) is evidence of the *contents* of another impression from the same type, the required assumption being merely that both were produced by the same type. The easier mode of proof is usually by a witness who offers one impression as representing his recollection of the other. The present principle, however, is to be distinguished from that which is involved when it is attempted from one type-impression to show the *authorship*, or publication, of another and similar one. Where the authorship (or publication) of a single impression is shown, the authorship of another impression exactly similar is not necessarily proved, although it ought at least to be regarded as evidenced, because the printing of one evidences in ordinary experience the probable printing of all others of the same content and appearance. That question, however, does not involve the present principle, *i.e.* the nature of the article, but involves the doing of an act, *i.e.* of authorship or publication.

§ 10 (IV). *Tendency, Capacity, Quality, Cause, or Effect.* It has been noted above how, in so many instances of other classes of cases, that which is the main or first apparent inference offered is upon analysis to be

resolved into an inference of the present sort, *i.e.* in which the probandum is a tendency, capacity, or the like. It is thus easy to see why the great majority of the rulings are concerned with this specific sort of inference.

What, then, is the mode of evidencing circumstantially a tendency, capacity, or quality of external inanimate nature? In general, the inference is from specific instances of *observed effects, exhibitions, or illustrations, to the supposed tendency, capacity, or quality producing them*. For example, the question at issue may be whether the vibrations of factory machinery have caused a conceded injury in an adjacent house. The main controversy is whether the former is the cause of the latter; but, in searching among the probable causes, the argument is obviously confined to those things which have a tendency or capacity to produce such effects, and thus the real proposition of the proponent now becomes this, namely, that the factory apparatus has a tendency or capacity to produce such effects. Thus, while one of the ultimate issues for the jury still remains the question whether the factory caused the injury, yet the subsidiary proposition to which the evidence has to be directed is whether the factory has such a tendency or capacity. In short, when it is desired to show broadly the occurrence of an event, or the cause of it, the process of thought usually resolves itself into two inferences, — first, that the capacity or tendency of something to cause the event is evidence that the event did so result therefrom; and, secondly, that something else is evidence of such a capacity or tendency; and it is the second of these inferences which in practice raises evidential questions.

§ 11. *Same: Principle of Probative Value (ante, No. 2, § 3).* The requirements for this process of inference are indicated by the logical principles already examined. The general logical requirement is that when a thing's capacity or tendency to produce an effect of a given sort is to be evidenced by instances of the same effect found attending the same thing elsewhere, these other instances have probative value to show such a tendency or capacity *only so far as the conditions or circumstances in the other instances are similar to those in the case in hand*.

But this similarity need not be precise in every detail. It need include only those circumstances or conditions which might conceivably have some influence in affecting the result in question. For instance, in the case put above, the circumstance that house B' was of wood while house B was of brick would conceivably affect the ease and likelihood of injury by vibration; but the circumstance that the inner walls in B' were papered while those in B were kalsomined, or that the house B' was painted red while the house B was painted green, or that the occupant of house B' was a Presbyterian while the house B was occupied by a Methodist, — such a circumstance, though perhaps material in other aspects, could not have any bearing upon the likelihood of injury by vibration. A similarity between the two cases in respect to such circumstances, therefore, would not be required. The similarity that is required is, in short, a similarity in essential circumstances, or, as it is usually expressed, a substantial similarity, *i.e.* a similarity in such circumstances or conditions as might supposably affect the result in question.

There is also available here, but not so commonly, the subordinate form of argument known as the *method of difference* (*ante*, No. 2, § 4). This mode of evidencing is in judicial investigations not so frequently available,

because it is not usually feasible to find instances which fulfill these requirements; but so far as the issue admits of experiments in which the conditions can be thus artificially manipulated, the mode is equally feasible. Occasional instances are found in the precedents, usually in the form of proof of the absence of the harm in question before the alleged harmful act and then the supervening presence of the harm immediately after.

§ 12. *Same: Distinction between Experiment and Observation.* There are two ways in which the data may be obtained for evidencing tendency, capacity, or quality, on the principle under consideration. One is by using such instances as may be found ready at hand, — instances which have already occurred in the ordinary course of events and happen to be suitable for the purpose. The other is to reproduce artificially and expressly the appropriate conditions and then observe the data obtained by this effort and prearrangement. The former process is the simple one of Observation; the latter is that of Experiment. The former is, in general scientific acceptance, distinctly inferior for most purposes to the latter; because, in taking data just as they come, it is not usually feasible to secure precisely the proper conditions required for the validity or certainty of our inference; while in the latter the conditions may usually be prearranged precisely as they are needed in order to make a sound inference. Indeed, the former source of data, in the modern scientific world, is looked upon as concededly so inferior in probative value, as not to be resorted to except in such situations (for example, geological formations and human diseases) as do not usually admit of artificial prearrangement and control.

§ 13. *Same: Distinction between Possibility, Capacity, Tendency, and Cause, as the object of Evidence; Evidencing a Possibility.* The notion of Causation is in logic by no means easy to analyze; but it is enough to point out here that certain superficially different terms represent essentially the same evidential process. When it is asked, for example, whether certain factory vapors were the cause of a destruction of herbage, the notion of "cause," simple as it seems, becomes upon analysis somewhat complex and at the same time indefinite. Stated in its broadest form, the notion of cause and effect is merely that of invariable sequence. It is only rarely, however, if at all, that such an abstract assertion can be made in universal terms that will stand examination. Thus, that a bullet shot from a pistol into the heart "causes" — *i.e.* will invariably be followed by — death, is a seemingly impregnable assertion; and yet not only may it not be true of bullets of every size, but it may not be true, even with ordinarily large bullets, in instances recorded here and there; and, in the future, surgical skill may show that the instances of non-sequence of death might be made even more numerous. The assertion may then be amended by adding limiting conditions, so as to say that, provided this and that and the other be so, a bullet through the heart causes death. In short, instead of an absolute certainty or invariability of sequence, the assertion will be only of a very high probability of sequence. In most instances no one thinks of making an assertion in absolute form, and it is easy to see that an assertion of causation means usually only an assertion of high probability or strong tendency. Thus, the planting of seed in good soil at the right time of the year will probably result in a harvest in due season; but the result is not invariably certain, because no rain may fall or the land may be built upon

or other influences may intervene. Though we should feel justified in speaking of the seed as the cause of the harvest, yet it would not be intended to assert anything more than that the seed has a tendency to produce the harvest. Coming now to an example of still weaker probability, suppose it to be asserted that gunpowder may spontaneously — *i.e.* without human meddling — explode, this is not saying that it will probably so explode, but merely that under a rare combination of circumstances it will do so, *i.e.* it has a capacity to do so.

Capacity, then, is a quality representing the same process of thought as tendency; *i.e.* it represents the possibility of a result as compared with the probability of a result, and above them both is a notion of a still higher degree, rarely realized in experience, — that of absolute certainty of result. All these are in the same category; the difference is that in the highest degree we think of the sequence as occurring under any and every combination of other circumstances, but in the middle degrees under the ordinary combinations only, and in the lowest degrees under rare combinations only. The notion of causation is perhaps most commonly associated with the middle and highest degrees only; *i.e.* one would naturally enough say, "A bullet through the heart will cause death," and "Sowing seed will cause a harvest"; while in the lowest degree one would either not speak at all of cause or would qualify the statement, for example, by saying, "Gunpowder may cause spontaneously an explosion." The essential thing to note is that *all these terms express only varying degrees of certainty or probability or possibility*; and that they all belong to the same logical category of thought:

Professor ALFRED SIDGWICK. *Fallacies*. (pp. 18, 285.) Abstract assertions of succession are commonly made with a large margin for the incalculable. We feel fairly contented in obtaining any hint of "law," — any knowledge, that is, which may form a basis for even imperfectly secure inference and proof. The only alternative to "Chance" is often "Tendency," and in our gladness to escape from Chance we dignify this as "Law." . . . Between mere guesses, hypotheses, theories, empirical laws, and "laws of Nature," there are only continuous differences of degree in certainty, according to the nature and number of the tests they have stood and the duration of their past invulnerability. . . . The resemblance in uncertainty between a fanciful guess and a proved law may be less important than the difference in the degree of certainty; but the fact cannot be safely hidden that the resemblance exists. . . . The method of proving laws is one and the same, whether they be the merest wildest supposition or the soundest explanation of the facts of Nature.

In the precedents upon the present subject, then, there is *no difference in logic or in legal principle* between evidencing a capacity, a tendency, or a certainty of operation or causation. The only difference is as to the practical need or utility of one or the other degree of likelihood in the case in hand. Thus, if the issue is as to a spontaneous explosion of gunpowder, we may appreciably advance our proof by showing merely a capacity, *i.e.* possibility, of such a result. But, if the issue is as to the destruction of herbage by vapors, the capacity of the vapors to do this would probably be conceded, and the only useful way of advancing the proof will be to show, not merely a capacity, but a strong tendency to produce this effect.

§ 14. *Same: Number of Instances required.* It follows, from what has just been said, that the number of instances offered is immaterial, so far as the logical principle is concerned. The only difference will be as to the

practical utility, for the case in hand, of the inference to be drawn. One instance may indicate a capacity to produce the result; but so feeble and indefinite a possibility may practically not advance the cause beyond what would be already conceded or easily accepted. So, too, a limited number of instances might show a tendency or common probability, and yet this tendency might be already beyond dispute and unnecessary to prove, and nothing short of an approach to certainty or universality of operation would advance the cause of the proof. Where the purpose is to show the existence of a mere capacity, so as to negative the impossibility of a thing's occurrence, here a single instance may suffice.

§ 15. *Negative and Affirmative Instances; Evidencing an Impossibility.* Whether an instance is to be regarded as affirmative or negative in form depends much on the issue as made by the parties. For example, if it were desired to prove performance of a warranty that a certain substance is calculated to deaden pain in dental operations, instances of the substance having made operations painless are affirmative of the quality alleged by the warranty; but if a patient were suing the dentist for careless use of a substance calculated to produce pain, the offer of the same instances by the dentist would in form negative the alleged quality, *i.e.* they would be instances in which pain was not produced.

Assuming, then, that the issue is such that the instances are thus genuinely negative in purpose and form, is there any difference to be noted as to the conditions of their use, as distinguished from affirmative instances? Keeping in mind the principle just examined (*ante*, § 13), it will be seen that there is no difference of logical principle, though there is practically a difference in availability, according to the object of the evidence:

(1) Suppose that the proponent in the issue is (correctly) offering only to show a *capacity* — *i.e.* an occasional possibility — of producing the effect. Obviously, it is here logically of no avail to produce against him instances in which the effect was not produced. They do not meet his point; for it is quite consistent with the capacity or possibility of producing the effect that there should be many instances in which the effect was not produced; for example, if the proponent has evidenced by one or two instances the capacity of a pistol to carry two hundred yards, it is logically of no avail for the opponent to answer with a negative instance (or instances) in which it has not carried thus far. Logically nothing short of a universal negative will suffice.

(2) Suppose, however, that the proponent is aiming to show something stronger than a mere capacity, *i.e.* a *general or usual tendency*, and has evidenced this by a few instances; here, obviously, an equal or greater or less number of negative instances or perhaps even a single instance would help to show that no usual or general tendency could be predicated, and thus would be practically available to answer the showing made by the proponent.

(3) But suppose, finally, that the proponent is interested in showing a fair *certainty or inevitableness* of effect; here even a single negative instance would suffice to dispose of his contention. The proponent cannot claim that an effect is invariably found, if an instance is shown in which the effect is not found; for example, where it is claimed that a near gunshot wound always leaves powder stains, a single instance will overturn this claim.

§ 16. *Same: Opposing the Proponent's Instances.* An opponent finds three processes at hand for opposing the proponent's instances. The three

ways have been examined already in dealing with Relevancy in general (*ante*, No. 2, § 8); and a brief notice of their application to the present sort of evidence will here suffice.

(1) *Explanation*. The opponent may show that, while the proponent's instances occurred *prima facie* under similar conditions, yet there was for one or more of them some attendant condition which was really important and was likely to have been the true source of the effect observed, so that the proponent's instance may or must be attributed to that other and not to the alleged tendency or cause in question. Thus he *explains away* the proponent's instance by showing that it does not mean what it seemed to mean.

(2) *Denial*. The opponent may *deny* that the proponent's instances ever did in fact take place.

(3) *Rivalry*. The opponent may offer rival instances, tending to the opposite result; and these may be of two sorts: (a) The proponent's instances being offered to show a tendency or capacity to produce an effect, the opponent answers by producing *other and negative* instances, in which the effect *did not appear*; arguing from this that the tendency must be only a limited one and does not produce its effects with any probability. (b) The opponent may offer other instances in which the same effect *did appear* but without the presence of the alleged cause. The absence, in these additional instances, of the thing alleged to have the causing tendency, forces us to look upon its presence in the proponent's instance as merely accidental, and explains that instance away as due not to the alleged tendency but to something else. Thus, to show that an illness following Monday's dinner was not due to the ham eaten, an instance of the same illness following Tuesday's dinner, at which the dishes were the same except that no ham was eaten, indicates that some other dish was probably the common cause on both occasions. The limitations on the use of this form of disproof are that the conditions (other than the alleged cause, *e.g.* the ham) were substantially the same on both occasions; for, unless this is insured, it might be supposed that the alleged cause — *e.g.* the ham — might have operated in the one case and some other cause in the other case. It is only by confining the difference of the two instances to the single circumstance in question that the argument is effective to eliminate it as the cause.

§ 17. *Same: Instances of the Foregoing Principles.*

How shall the various precedents be arranged most usefully for the present purpose? The principle involved is the evidencing of a tendency (capacity, or quality) by its effects. The precedents may therefore best be grouped according to the various kinds of tendencies (capacities, or qualities) and the various kinds of effects. A preliminary grouping may be A. *Material effects* (for example, marks left by a pistol shot, damage done to houses by smoke, fire set by locomotive sparks); B. *Corporal effects*, including animal and human effects (for example, wounds produced by shots, disease produced by poison, injuries by dangerous highways); C. *Mental and Moral effects, i.e. on human conduct* (for example, efforts to escape the danger of a railroad collision, time required by a workman for work, precautions required for a dangerous machine).

A. *Instances of Material Effects, as Evidence*. In this way may be evidenced the existence (or not) of sundry *nuisances*, by the presence (or ab-

sence) of certain effects under similar circumstances (for example, of similar damage by other factories, streams, hospitals, sewers, operating under analogous conditions); of the nuisance-nature of a *railroad*, by its injurious effects upon similar adjacent property, in respect to smoke, noise, vibration, and the like; of the tendency of *water*, in various forms, by its effect under similar circumstances (for example, in the flowage of streams, the silting of harbors, the breaking of dams, the destruction of bridges); of the tendency of *gases*, by their injurious effects, on other houses, trees, or water supplies; of other injurious operations and structures affecting the condition of *land* or *buildings* by vibration, burning, or otherwise; of the tendency or quality of *tools*, *weapons*, *vehicles*, *acids*, and other materials, as indicated in their effects upon similar substances under similar conditions; and of the tendency of a *machine* or apparatus, as shown by other instances of its operation under similar circumstances, to operate defectively or otherwise (for example, in actions for breach of warranty or personal injury), or of the workings of other similar machinery (tools or apparatus) provided the conditions were similar.

B. Instances of Corporal Effects, as Evidence. The capacity or tendency of a *weapon* (gun or pistol) may be indicated by the appearance of other wounds, with reference to size of bullet, proximity of weapon, nature of powder, or direction of the shot; the specific tendency of a *drug*, *poison*, *disease*, *food*, or other substance, by the corporal symptoms or effects in other like situations, either on animals or on human beings; in particular, the *intoxicating* tendency of a *liquor*, by its effects upon others partaking it. The same principle applies to *similar injuries to other persons at the same machine, highway, railroad, or building*. If a white powder's tendency to produce illness may be evidenced by the symptoms following its administration, then in the same way the tendency of a projecting spike in a gate to catch and tear the garment of a passer-by may be evidenced by instances of such tearings, and the tendency of a part of a highway to make the feet trip upon it may be shown by instances of trippings. The mass of precedents dealing with the use of other injuries (or "accidents") as evidencing the *dangerousness of a place or a machine* are concerned with an inference of precisely this form, *i.e.* an inference as to the harmful tendency or capacity of the machine, highway, building, or track, as indicated by the occurrence of such harm to human beings in other instances.

The other instances of injuries received should have occurred under substantially similar circumstances. Note that a *double inference* usually is necessary, *i.e.* from the other instances to the tendency or condition at the time of their occurrence, and then from the tendency or condition at that time to its persistence at the time in question. The principle governing the latter inference has also been examined (*ante*, § 6).

C. Instances of Mental and Moral Effects, as Evidence. There is no reason why the tendency or quality of an object of external nature should not sometimes be as easily ascertainable from its mental or moral (psychological) effects as from its corporal or its material effects, by adducing instances of such effects, if they have attended the use or operation of the thing in question. For example, if one is looking out of the window of a comfortable home the persons on the high way are observed to be shuddering and turning up their ulster collars, a *natural* inference is that the temperature without is

extremely cold. Or, if on looking some distance ahead, as one drives through a street, all the vehicles are observed to be turning aside at a certain apparently vacant spot in the road, a natural inference is made that some obstruction exists, such as a pavement hole or a broken electric wire. This sort of inference from human or animal conduct is of constant service in daily life, and claims also an important part in the realm of evidence for litigated issues. All those material conditions and qualities of material objects in external nature which become effective with reference to the ordinary sense perceptions and muscular activities of human beings or animals may be evidenced by specific instances of such effects, — used subject to the limitations of the general principles already noticed. A condition of *light* may be evidenced by instances of other persons' experience in *seeing* or *identifying* under similar circumstances; and this application of the principle includes broadly all cases of the possibility of *mistaken identity*, as shown by other instances of mistaken recognition. A condition of *sound* may be evidenced by instances of other persons' experience in hearing under similar conditions. The *time* required for walking or riding a certain *distance*, or for stopping a train within a certain distance, may be evidenced by other instances under similar conditions. The *height* of a *cattle guard*, with reference to the possibility of cattle leaping it, may be evidenced by instances of what cattle have done with similar fences; or the amount of animal *feed*, by the quantity consumed by others. In general, when a question arises whether at a certain machine, house, field, mine, or other thing, a certain act can be done, under given conditions of time, strength, skill, or achievement, "one way to do," in the language of Mr. Justice Doe, "is to speculate about it; and another way is to try it."

So, too, a *measure of negligence, danger, insufficiency, unreasonableness, cruelty, unskillfulness, or their opposites*, may be evidenced by similar conduct or habits of other persons or animals. If a person is in the house and wishes to know whether he needs to take out his umbrella with him, and the condition of the atmosphere makes it difficult to see whether it is raining, he may look at the passers-by, and observe whether their umbrellas are lifted. If he wished to ascertain whether a hill was too steep to descend in a wagon without a brake, he would learn something by observing whether the brake was applied to other persons' wagons in descending. If he observed the workmen in a powder factory wearing felt shoes, he might infer that the tendency of the powder was to explode from the concussion or friction of ordinary shoes, and that felt shoes were necessary for obviating this tendency. In all these cases, he is judging of the nature or tendency of a material object from its effects on the *conduct of others*. This tendency of the material object is usually not shown (as in the preceding classes of cases) by its direct effects upon senses or muscles, — as where a person uses his vision in sighting an object or feels pain upon eating a substance, — but by its indirect effects, *i.e.* usually, by voluntary conduct, exhibited in avoiding the supposed tendency of the object. Thus, the wearing of the felt shoes is that sort of conduct which the person is forced into in order to avoid the consequences otherwise to be expected; the raising by the traveler of the protective umbrella is what he is put to in order to escape a drenching; and the use of the brake is resorted to for avoiding the danger of slipping down the hill. Nevertheless,

the conduct is equally cogent evidentially as indicating the tendency of the material object. The only difference is that it approaches a degree nearer to the line between testimonial and circumstantial evidence, and thus raises more distinctly the question of the Hearsay rule. In the application of this principle, then, the dangerous tendency of an object to *frighten horses* may be evidenced by instances of other horses being frightened by it under similar circumstances. So, too, the tendency of an extraordinary situation to *frighten human beings* (as when in a collision the reasonableness of a person's conduct in jumping or rushing out is in issue) may be evidenced by the conduct of other persons similarly situated. Where the ordinary operation of (for example) a railroad car is in issue, with reference to the care to be used by *passengers, employees, or highway travelers*, or the possibility of *safely riding, standing, passing, coupling, or climbing* in a certain manner, the same principle applies, though the risk is greater of the jury's improperly confusing the evidential effect with the legal standard of care. Where the care required of the *owner of a railroad* is in issue, this sort of evidence may serve in a variety of ways, — to indicate, for example, the adequate construction or operation of tracks, platforms, bridges, cars, turntables, spark arresters, switches, or any object whose qualities are exhibited by the specific conduct or habitual practice of other persons or *other railroads* in using it. Thus also may be evidenced the condition of a *factory, mine, house, vessel, machine, boiler*, or other apparatus, with reference to the propriety of certain precautions in construction and operation; or of a pavement, ditch, or other part of the *highway*, with reference to its proper mode of use; or of *money or chattels*, with reference to the proper method of loading, warehousing, using, mending, or otherwise handling; and, in particular, of a *business*, or a *stock of goods*, with reference to the prudence of carrying it. Whether in *medical matters* a certain kind of remedy, skill, or treatment is necessary or sufficient, may often be evidenced in this manner. Even in matters more nearly involving moral standards, some light may properly thus be obtained from the conduct of other persons, — as when the propriety of a *schoolmaster's* or *ship-captain's* discipline or treatment is evidenced by the practice of others; or when the *cruelty* of treatment to animals is evidenced by other persons' like methods.

5. **ROBERT SALMON'S CASE.** (CAMDEN PELHAM. *Chronicles of Crime.* ed. 1891. Vol. II, p. 417.)

This case arose out of the extremely dangerous practice of administering quack medicines. Morison's vegetable pills have been for many years an article from the sale of which immense profits have been derived; but it is to be regretted that in more than one instance the life of the patient has been sacrificed, from their undue and improper use.

At the Central Criminal Court Sessions, which commenced on Monday the 4th of April, 1836, Mr.

Robert Salmon, a medicine vendor in Farrington Street, was indicted for the manslaughter of Mr. John M'Kensie, by administering to him certain large and excessive quantities of pills, composed of gamboge, cream of tartar, and other noxious and deleterious ingredients. The deceased, it appeared, was the master of a vessel, and lived in the neighborhood of the Commercial Road. He was induced to take some of Morison's pills as a purgative, upon the representations of a Mrs.

Lane, a woman who was employed by his wife as a sempstress, who sold the Hygeian medicines; and subsequently Mr. Salmon's aid having been claimed, on account of his suffering from rheumatism in the knee, he recommended increased and still-increasing doses, until at length the deceased became so ill as that his life was placed in jeopardy. Medical aid was now called in, but it was too late, and death soon put an end to his sufferings. A *post-mortem* examination left no doubt that the medicine prescribed by the prisoner had been the cause of this termination of the case, and the present indictment was in consequence preferred.

On the part of the defendant a great many persons were called from all parts of the kingdom, who stated that they had taken large quantities of these pills, with the very best

results, as a means of cure for almost every species of malady to which the human frame is subject. One person stated that he had taken no fewer than twenty thousand of them in two years, and that he had found infinite relief from swallowing them in very large doses.

Mr. Justice PATTESON left the case to the jury, who had to decide upon the facts which had been proved; and after about half an hour's consideration they found a verdict of "Guilty," with a recommendation to mercy, upon the ground that the defendant was not the compounder, but the vendor only of the medicines.

The trade in Morison's pills is, however, still carried on to a very great extent, and Mr. Salmon continues one of the largest agents for the sale of the medicine in the metropolis.

6. BRADFORD *v.* INSURANCE CO. [Printed *post*, as No. 49.]

7. EIDT *v.* CUTTER. (1879. MASSACHUSETTS. 127 Mass. 522.)

Tort for injuries to the plaintiff's house and fence, alleged to have been caused by the fumes, vapors, and gases escaping from the defendants' copperas works, and discolored the paint on the house and fence.

At the trial in the Superior Court, before DEWEY, J., it appeared that the premises of the parties were in the southerly part of the city of Worcester, and in close proximity to an open sewer maintained by the city; and there was evidence tending to show that from this sewer, and from the piles of filth dug from it and laid on its banks, there were foul exhalations of gases containing ammoniacal salts. The evidence of the defendants' experts tended to show that the gases and substances escaping from the copperas works would not of themselves produce the discoloration visible on the plaintiff's house, but that the discoloration as seen was produced by the

SUPREME JUDICIAL COURT OF MAS-

union of the gases and substances from the defendants' works with the ammoniacal gases escaping from the sewer. The defendants' experts testified that copperas deposited on a painted surface did not break through or abrade the paint; and exhibited to the jury a board, upon which they had atomized copperas in large quantities, and changed its color by ammonia, from which the copperas had been brushed, and the painted surface was shown intact underneath. This experiment was offered only to show the fact that copperas did not penetrate paint.

The evidence of the plaintiff's experts tended to show that the condition of the plaintiff's house and fence could be, and was, brought about by the gases and substances coming from the defendants' works; that the gases coming from the open sewer probably accelerated and intensified the effect, but that there

is a sufficient quantity of ammonia in ordinary atmosphere to account for the present discoloration. These experts stated that they formed their judgment from their general knowledge of chemistry, from experiments heretofore made, and from a series of experiments recently made by them, both at the house of the plaintiff, and in the city of Providence, Rhode Island, and elsewhere. The experiments made at the house of the plaintiff were upon boards, papers, etc., exposed for six weeks to the atmosphere, and to the fumes, vapors, and substances therein contained, and were acted upon thereby under the same circumstances and conditions as the plaintiff's house during the time they remained on the house. The experiments made at Providence and elsewhere consisted mainly of atomizing copperas upon boards, papers, glass, etc., and exposing the same to the atmosphere and were made under conditions and circumstances which, as the plaintiff's experts stated, were, in their opinion, as near like those surrounding the plaintiff's house, in the absence of the sewer, as was possible, and were made for the purpose of ascertaining the effect of copperas gases where the atmosphere was otherwise pure. The boards, papers, etc., thus used by these witnesses of the plaintiff in these experiments, were brought into court and exhibited, and explained to the jury, and a detailed account of the experiments given to the jury by the witnesses. The defendants objected to the introduction before the jury of any of the experiments, and the evidence given explanatory thereof, made by the plaintiff's experts at Providence, Rhode Island, and at other places other than the plaintiff's house. The judge admitted these last-named experiments and the evidence relating thereto on the ground that,

the experts, having first stated their judgment as to the character and effect of the gases and substances from the defendants' works alone, and when in union with ordinarily pure air, and when in union with the gases coming from the city sewer, might state the grounds on which they based their judgment; and, they having stated that, among other things, the grounds on which they based their judgment were certain experiments made by them, the judge allowed the witnesses to testify as to the experiments made by them, limiting them to the statement of the experiments on which they said they had, in part, based the judgment and opinion as to which they had testified.

The jury returned a verdict for the plaintiff; and the defendants alleged exceptions.

W. S. B. Hopkins & A. G. Bullock, for the defendants. *J. R. Thayer*, for the plaintiff, was not called upon.

BY THE COURT. The question in controversy, and upon which both parties had introduced the testimony of experts was whether the injury to the plaintiff's house was caused by the fumes and gases from the defendants' works, or by the emanations from a sewer. The grounds and reasons of the opinions of the experts, including the details of experiments made by them under conditions and circumstances which, as they testified, were as nearly as possible like those surrounding the plaintiff's house in the absence of the sewer, were rightly permitted to be stated by the experts, in order to assist the jury in understanding their testimony and applying it to the case. *Lincoln v. Taunton Copper Co.*, 9 Allen 181. *Commonwealth v. Piper*, 120 Mass. 185, 190. *Williams v. Taunton*, 125 Mass. 34. Exceptions overruled.

8. EAST ST. LOUIS v. WIGGINS FERRY CO. (1882. APPELLATE COURT OF ILLINOIS. 11 Ill. App. 254.)

Error to the City Court of East St. Louis; the Hon. CHARLES T. WARE, Judge, presiding. Opinion filed September 29, 1882. . . .

BAKER, P. J. This was a suit by the Wiggins Ferry Company against the City of East St. Louis to recover damages sustained by it as owner of certain lots of land, occasioned by the building of the approaches to the Illinois & St. Louis Bridge over and along Crook Street in said city. See *Stack v. City of East St. Louis*, 85 Ill. 377. A jury trial resulted in a verdict and judgment for \$10,610. . . . A portion of the claim of plaintiff was for damages occasioned by the passage of loaded wagons, locomotives, cars, and trains over the superstructure of the bridge approach, whereby its lots were so shaken as to be greatly injured for building purposes. Plaintiff had introduced testimony tending to prove this claim. Thereupon defendant offered to prove how the bridge approach was constructed on the other side of the river in the city of St. Louis, and that there is more vibration there to the adjoining property on account of the operation of trains which cross the bridge than there is on the Illinois side, and that the three-, four-, five- and six-story brick buildings in St. Louis, close to the bridge approach, are not injured by the

vibrations. This testimony was objected to and the objection sustained. This was error, more especially in view of the character of the evidence that had gone to the jury on behalf of plaintiff, bearing on this issue. Differences arising from diversity of soil or geological formation, if any, or otherwise, could readily have been ascertained on cross-examination, or by the introduction of rebutting testimony. Besides, the proffered testimony included the proposition that the vibrations were greater on the west than on the east side of the river.

Defendant also proposed to prove that the vibrations caused by the Belt Railway are greater in the vicinity of Crook Street than the vibrations of the bridge approach. This testimony was not permitted by the court to go to the jury. If, as some of plaintiff's witnesses had testified, buildings, walls, plastering, and chimneys on plaintiff's lots, and on other lots on Crook Street and in the immediate vicinity of plaintiff's property had been cracked and damaged by vibrations, then surely it was competent to show the greater part of these vibrations were occasioned by trains on the Belt Railway, and not by travel over the bridge approach. The ruling of the court in this regard was erroneous. . . .

Reversed and remanded.

9. KNOWLES v. STATE. (1885. SUPREME COURT OF ALABAMA. 80 ALA. 9.)

Appeal from Wilcox County Court. Tried before Honorable JOHN PURIFOY.

Mat Knowles was indicted, and tried in the Wilcox County Court, for selling intoxicating liquors in violation of a local statute. The case was tried by the court, on the plea of "not guilty"; the defendant was found guilty, and a fine of one

thousand dollars adjudged against him. One of the witnesses for the State testified that he had bought of the defendant three bottles containing fruit, with liquid around the fruit; that he and another had eaten of the fruit, and drunk the liquid that was in the bottles; that the effect of this eating and drinking upon witness was like the effect of

drinking whisky; that he felt like he was intoxicated. After the State had closed, the defendant introduced a witness, Dock Griffith, who testified that he had many times bought of the defendant the same kind of fruit and liquid in bottles, described by the witnesses for the State, and had eaten the fruit and drunk the liquid without feeling any intoxicating effect, or any such effect as he experienced from drinking whisky. The solicitor moved to exclude this testimony of defendant on the ground that it was irrelevant; and, the same was excluded by the court. The defendant introduced a number of other witnesses, who testified, substantially, as the witness Griffith, that they had purchased of the defendant fruit and liquid, such as was testified about by the witnesses for the State, had eaten the fruit and drunk the liquid, without feeling any intoxicating effects. Their testimony was also, upon motion of the solicitor, excluded by the court. Defendant excepted to these several rulings of the court, and, on appeal, assigns the same as error.

T. N. McClellan, Attorney-General for the State.

SOMERVILLE, J. . . . The court, in our judgment, erred in excluding

the statements of the several witnesses, who testified as to the effect upon themselves of the beverage for the sale of which the State had elected to prosecute the defendant. . . . The most available mode of testing the nature and properties of a fluid or drug, next to that of chemical analysis, is by its effects on the human system. That a liquor when taken in certain quantities intoxicated or failed to intoxicate the person taking it, is as competent to prove or disprove its intoxicating qualities, as it would be to prove the poisonous nature of a drug by the effect following its administration. Negative testimony of this kind may often be very weak and inconclusive, because of the comparison involved in determining the relative facility with which different persons may or may not become intoxicated or drunk. But we cannot say what would have been the effect of this evidence upon the mind of the judge, who was substituted for the jury as the trier of the facts of the cause. We decide nothing more than the admissibility of this evidence, leaving to the County Court itself to decide what shall be its weight or credibility. The judgment is reversed and the cause remanded.

10. GOLDEN REWARD MINING CO. v. BUXTON MINING CO. (1899. FEDERAL CIRCUIT COURT OF APPEALS. 97 FED. 413.)

In error to the Circuit Court of the United States for the District of South Dakota.

The Buxton Mining Company, an Iowa corporation, brought this action against the Golden Reward Mining Company, a corporation of South Dakota, to recover damages for a wrongful entry upon its property, situated in the state of South Dakota, known as the "Bonanza Lode Mining Claim," and for the removal therefrom and conversion to its own use of a large amount of gold- and silver-bearing ore, alleged to be of the value of

\$200,000. The Golden Reward Mining Company, the defendant below (the plaintiff in error here, referred to hereafter as the defendant) filed a general denial, which merely put in issue the commission of the alleged trespass, and did not seek to justify it. There was a lengthy trial before a court and a jury, lasting from February 9, 1898, until March 18, 1898, when the jury returned a verdict against the defendant below in the sum of \$61,500, on which verdict a judgment was subsequently entered in favor of the plaintiff below. The proceed-

ings at the trial are brought before us for review by a writ or error.

William L. McLaughlin and *William R. Steele*, for plaintiff in error.

Eben W. Martin (*Norman T. Mason*, on the brief), for defendant in error.

Before CALDWELL, SANBORN, and THAYER, Circuit Judges. THAYER, Circuit Judge, after stating the case as above, delivered the opinion of the Court.

Preliminary to any discussion of the numerous errors that have been assigned, it will be advantageous to state certain facts which are practically undisputed. The parties to the suit are the owners of adjoining mining claims in the state of South Dakota. It will suffice to say generally concerning the location of the claims that the Bonanza claim, which belonged to the plaintiff below, and on which the trespass was committed, lay immediately to the west and south of two claims the Silver Case and the Tilton, which belonged to the defendant company. Prior to August, 1891, the defendant had done a great amount of mining, not only on the Silver Case claim, which lay to the east of the Bonanza claim, but also on another claim which it owned, known as the "Golden Reward Claim," which latter lay immediately to the east of the Silver Case, and on certain other claims not necessary to be mentioned. It had extensive underground workings on both of the last-mentioned claims, consisting of tunnels, stopes, and levels, whereas the Bonanza claim was at that time practically undeveloped, no work of importance having been done thereon or thereunder. Subsequent to July, 1891, the defendant company extended two of the drifts or tunnels on its own property across the boundary line, and underneath the Bonanza claim, and there excavated two stopes, known as "Stope No. 2 West" and "Stope No. 3 West," from which it extracted a large amount of mineral-bearing

ore between the months of August, 1891, and August, 1892. The trespass so committed was not discovered by the plaintiff company until shortly prior to November 20, 1895, when the present action was brought; and the discovery at that time was due to the fact that the excavation of the aforesaid stopes ultimately caused the superimposed earth to settle, making depressions on the surface. As soon as the depressions became visible, the plaintiff company set on foot an investigation, which speedily developed the extent of the trespass. While the defendant company by its answer denied the trespass, yet on the trial such defense was practically abandoned, and the trial resolved itself into a consideration of three issues of fact: First, what was the quantity of the mineral taken from stopes Nos. 2 and 3 west, underneath the Bonanza claim? Second, what was the value of the mineral so abstracted? And, third, was the trespass committed knowingly and willfully? A large amount of testimony was taken on these issues, very little of which has been preserved in the bill of exceptions. . . .

During the progress of the trial, counsel for the defendant company inquired of a witness how many men were employed by the defendant in its mines upon the Golden Reward and the Silver Case claims at the time when ore was being extracted from stopes Nos. 2 and 3 west, underneath the Bonanza claim. This question was objected to, whereupon counsel for the defendant made the following statement, in substance: That they proposed to show that during the period in question, from September 1, 1891, to August 1, 1892, the defendant kept an accurate account of the number of men employed in all of its mines located within the territory which it was then working, and that they were all worked together, as constituting one property; that the

conditions under which mining was done in its own territory were the same as the conditions in stopes 2 and 3 west, and that the same number of men would break approximately the same amount of ore in the said stopes as in the stopes on its own claims; that during the period inquired about the total output from all the mines, including stopes 2 and 3 west, was from 25 to 40 tons per day; and that by dividing the whole output from all the mines by the total number of men employed, and thus ascertaining the average output per man, and by multiplying the average output per man by the number of men whom the jury might find were employed in stopes Nos. 2 and 3 west, while they were being worked, the jury could thus ascertain the number of tons of ore taken from said stopes Nos. 2 and 3 west, within the plaintiff's territory. The offer of proof was rejected, and an exception was saved. At another stage of the trial the defendant also offered in evidence a book kept by it, which was known as its milling or assay book, first having supplemented the offer by testimony to the following effect: That, during the period covered by the alleged trespass (that is to say, from about September 1, 1891, to about August 1, 1892), ores were received by the defendant by rail at its mill, which was some distance from the mines, in a mixed state, which came from different localities on the Golden Reward and Silver Case claims and from stopes Nos. 2 and 3 west, underneath the Bonanza claim; . . . and that a faithful record of these assays was kept by its milling or assay book during the entire period aforesaid. The cross examination of witnesses in connection with the offer of the assay book developed the fact, however, that the ores thus mixed and assayed came from all parts of the defendant's territory which it was then engaged in working, as well as from stopes Nos. 2 and 3 west, underneath the plaintiff's

claim, that some of the ores thus assayed came from a locality three fourths of a mile distant from stopes Nos. 2 and 3 west, and that 1000 feet intervened between those stopes and other localities from which ore was drawn which entered into the aforesaid assays. Besides, there was other evidence introduced, which tended to show that while the trespass was in progress the defendant company failed to keep a daily record of the number of cars of ore taken from its mines, and the locality from whence it was derived, as it had done prior to the commission of the trespass, and that it had also filled up stope No. 3 west, and had closed the entrance thereto, and had blasted out the timbers after the stope was exhausted, which was an unusual proceeding among miners. The assay or milling book was rejected, when the same was offered, and an exception was likewise saved. The two exceptions thus noted have been argued at considerable length in this court, and, as the merits thereof involve an application of the same general rules of evidence, it has been deemed most convenient to consider them together.

As a general rule, any evidence is admissible which has a reasonable tendency to establish a material fact in controversy, provided the evidence is not of a hearsay character or otherwise incompetent. . . . The professed object which the defendant had in view in tendering proof of the total number of men who were employed in its mines during the period of the trespass, and in offering its milling or assay book, was to show by the first item of proof the total amount of ore taken from stopes Nos. 2 and 3 west, and by the second item, or by the assay book, the richness or assay value of such ore. It is obvious that the probative value of the testimony which was thus offered depended altogether upon the assumption made in the one instance that

a miner could extract the same quantity of ore each day whether he worked in stopes Nos. 2 and 3 west, or in any of the numerous stopes and drifts where ore was being mined within the defendant's claims, and upon an assumption made in the other instance that all the ores which were mixed and assayed during the period in controversy were of about the same value, no matter from what source the same were derived. If the testimony in question had been admitted, therefore, it is clear that the plaintiff would have been entitled to show the fallacy of each of these assumptions, namely, that the character of the rock in which the ore was embedded, or the facilities for getting at it and extracting it, were such that more ore could be obtained in a single day from stopes Nos. 2 and 3 west than from other stopes within the defendant's territory, and that the ores taken from stopes 2 and 3 west were of much greater value than the other ores that were mined on the defendant's claims, with which they had been mixed. In other words, if the objectionable testimony had been admitted, it would have led necessarily to a lengthy inquiry before the jury as to the quantity and value of the ore found in all of the defendant's workings within the Golden Reward and Silver Case claims, and as to the character of the rock in which the ore within said claims was embedded, and as to the facilities which existed during the period of the trespass for extracting it. . . . In the present instance the evidence which was offered by the defendant company could not have been admitted with any propriety on the ground of necessity. The record shows that there was an abundance of direct evidence to establish both the quantity of the ore, and the richness of the same, that had been taken from stopes Nos. 2 and 3 west. The defendant offered direct

testimony (being that of its superintendent, and that of its miners who had worked in the two stopes on the plaintiff's claim) showing the quantity of ore taken from those stopes. It also introduced a record of assays, which were made by its own superintendent, of the ores in stopes Nos. 2 and 3 west while it was working the same. The quantity of ore contained in these stopes could also be computed with reasonable accuracy by reference to their dimensions. Moreover, both parties entered these stopes after the present suit was instituted, and selected samples from the side walls and had them assayed, and in this way were able to establish with great certainty the richness of the ore which the stopes had contained. Having such direct evidence at its command, the defendant company had no right to fortify it by evidence of the kind above indicated, which would have introduced numerous collateral issues, and lengthened the trial indefinitely.¹ We are of opinion, therefore, that the trial court properly excluded the testimony to which the foregoing discussion relates. . . .

Another exception was saved by the defendant to the introduction of certain evidence, which deserves a brief notice. The plaintiff company was allowed to show the average assay value, as made by a competent assayer, of certain samples of ore that had been taken, as it seems, by Professor Jenney and some other persons from the side walls of stope No. 3 west, and adjoining drifts in the Bonanza claim, after the trespass was discovered. The proof was offered, evidently, to establish the value of the ore body that had been removed by the defendant from stope No. 3, but its admissibility for that purpose is challenged by the defendant. It is insisted, in substance, that the admission of evidence showing that

¹ [This ground for excluding the evidence rests on a rule of Admissibility not considered in this volume. — Ed.]

the average value of samples of ore taken from the inside of stope No. 3 was \$41.75 per ton, and that the average assay value of other samples taken from places immediately adjoining the stope was \$48.69 per ton, was an error prejudicial to the defendant, which warrants a reversal. The record recites, however, that, before the average assay value of these samples was proven, it was shown that all the samples of ore taken from outside of the stope were taken immediately adjacent thereto, as it had been worked out by the defendant, and that the ore bodies from which said samples were derived were of the same general character as the ore mined out of said stope, and a continuation of the same ore body. The record also shows that, when the average assay value of the several samples was admitted in evidence, the trial judge

cautioned the jury that the average assay value was not to be taken as an absolute mathematical demonstration of what the value of the ore body in stope No. 3 was, but that the proof was admitted simply for their consideration, and that they should give it such weight as they thought it ought to receive; first considering whether the samples were fairly representative of the body of the ore that had been extracted from the stope. In view of the locality from which the ore samples were taken, and its proximity to the stope, and in view of the caution administered by the court when the objectionable testimony was admitted, it cannot be successfully claimed that an error was committed. The testimony certainly had a marked tendency to establish the grade of the ore which the defendant company had appropriated.

11. CHICAGO, CINCINNATI & ST. LOUIS RAILWAY CO. v. DIXON. (1892. APPELLATE COURT OF ILLINOIS. 49 Ill. App. 293.) . . .

Statement of the facts by the Court. Appellee's left hand near the wrist was crushed between the deadwoods of two cars at St. Francisville, on the 4th day of July, 1891, while, as brakeman for appellant, he was attempting to make a coupling. The injury was so serious that the arm had to be amputated. The declaration avers that "the couplers, by which said cars were fastened together, were out of repair and not sufficient for the purpose used, and the defendant by the exercise of reasonable care could have known of said defect, and while the plaintiff was in the performance of his duty as brakeman, with due care and without knowledge of the condition of said machinery, he had his left hand caught by and in the machinery used for coupling the said cars together, thereby injuring him," etc.

The plaintiff had been a railroad man about twenty-five years, and describes the accident substantially as follows: When his train — a

freight train — reached St. Francisville, some empty box cars had to be taken or moved from the side track. In doing so, there was a coupling to be made of the cars at the side track, which cars had iron deadwoods, located on each side of the drawbars and a little above. The couplings on these cars were what are called Ames couplers — bull tongues, commonly called. Both of the couplers were alike, except that the still car, to the right, had no bull tongue in; the tongue was out entirely; while the car to the left — the moving car — had a bull tongue in. As the running car was slowly pushed back by the engine to make the coupling, he stepped in front of that car, with his left side rather toward the car, and moved back with it. Just before the cars came together, he reached over the deadwood and caught hold of the iron pin, so as to push or drop it through the hole in the drawbar or drawhead and the hole in the

bull tongues, where the bull tongues should enter the drawhead of the right, or still car, and thereby make the coupling. He did not have to adjust the bull tongue in the drawhead of the left or moving car, so as to make it enter the aperture of the drawhead of the right or still car, as the cars were of the same height. The bull tongue projected straight out from the drawhead of the moving car and had a hole in it for the pin to drop through, thereby answering in the place of an ordinary car link. The pin which he had seized with his left hand projected through the upper part of the drawhead, and into the aperture entered by the bull tongue, so that as the bull tongue of the moving car entered the drawhead of the still car, the end of it struck the projecting end of the pin, thereby pressing the upper end of the pin outward toward and against the raised upper lip at the mouth of the iron drawhead, and thus caught the finger of the left hand between the pin and the lips of the drawhead and held him there, as he says, "until the car came ahead, and the car bounced away." When the cars came together the drawheads receded until the deadwoods of the cars came solidly together, and on the reaction, he says, the drawheads of the right or still car pulled out nine or ten inches, and he was still held fast. He says then "I grabbed hold of the pin with this — the right — hand to get loose, and it held me in that position until it (suppose he means deadwoods) got very near together again and it took up the slack and I got my hand loose and pulled it out but did not get it out quick enough and got it caught between the deadwoods."

The plaintiff was then asked by his counsel these questions: "Q. I will ask you to state to the jury what condition these couplers were in. A. The one to my left, it had a lever on, and the chain attached to this bull tongue, that was broken

off. Q. What was broken off? A. The lever. Q. Which part of it was broken? A. That was broken on the left; this link was in there so you could work it any way you wanted to, but the one to my right (the bull tongue in car to his right) was out entirely. Q. Now state, Mr. Dixon, in making a coupling of that kind, where the coupler is out on one side and in on the other, how the coupling is made? A. You can come back, and it is not necessary to catch hold of the pin (means link) at all, because it is all of one height." The bull tongue was in left or moving car and that was used for a link. "Q. State to the jury what condition as to repair the couplers were in, so they may understand it. A. The car to my right — the bull tongue was out entirely; the one to my left, the lever that works the bull tongue was broken, and this drawhead to my right certainly must have been out of order, for there was a great deal of lost motion there. It pulled out at least nine or ten inches; most generally it pulls out three or four inches." It is more dangerous to make couplings of cars that have deadwoods. He says such cars, however, were in general use.

On cross-examination he is asked: "Q. What defect was there about this coupling? A. I don't know, unless the springs were broken or the following plates out. Q. You can't testify positively as to that? A. Of course not. Q. You knew before you entered this car that the lever was gone — broken? A. Oh, yes; certainly. Q. You knew that coupling where the lever is gone is more dangerous than the other kind, didn't you? A. Oh, yes; more dangerous for a man to go in, of course." . . .

OPINION OF THE COURT, SAMPLE, J. The appellee's counsel does not insist that the appellant was negligent in furnishing cars with deadwoods, or with Ames couplers. Nor is such negligence based on

furnishing a car with a broken lever or chain; but the counsel says: "Plaintiff claims that the looseness of the drawbars, allowing it to recede sooner, and a greater distance than it could or would, had it been in repair, allowing the bull tongue to shy the pin in an unusual and unexpected manner, caught his fingers when he was not expecting such occurrence." The injury cannot be attributed to the receding of the drawbar of either car a greater distance than usual, for the reason that there is no evidence to sustain that theory. All of the evidence shows that the drawbars were constructed so that they would recede and permit the force of the concussion of the cars, as they came together, to be sustained by the deadwoods. That is the only purpose of the deadwoods. They are intended to receive the force of the concussion, and thus relieve and preserve the drawbars from being broken. In such case, the drawbars of cars having deadwoods cannot recede, or at least in this case the evidence does not show that they did recede further than was necessary for the deadwoods to receive the force of the shock of the cars as they came together. The evidence is not that the drawheads receded too far, but that the drawhead of the right or still car pulled out too far, as shown by the evidence of the plaintiff above quoted. He testified as follows: "This drawhead to my right (meaning the drawhead of the still car) certainly must have been out of order, for there was a great deal of loose motion there. It pulled out at least nine or ten inches. Most generally it pulls out three or four inches." It will be observed that he does not pretend to state how far the drawbars receded, or that either of them receded farther than usual. How the pulling out of the drawbars of the cars, or either of them, could have caused or contributed to this injury, we are unable to understand.

The pulling out of the drawhead of the right car occurred on the reaction, after the cars had come together. Before that time, according to the plaintiff's testimony, his fingers had been caught as heretofore described.

Even if the drawbar had receded farther than usual, we are at a loss to understand how that could have caused appellee's injury. Why should such receding cause the pin to be forced or canted over, so as to catch the appellee's hands? As a cause, the receding would naturally have the opposite effect. The bull tongue was in the left, or moving car; the pin, of which appellee had hold, was in the hole of the drawhead of the right or still car, with the lower end projecting into the aperture of that drawhead. The bull tongue being fastened, was stiff — therein differing from a link — and when it struck the lower end of the pin, the canting or shying would naturally occur, and the receding of the drawhead could not, as a cause, have operated to produce it.

It was incumbent on the appellee to prove, not only a defect in the coupler, but the defect that caused the injury. Merely proving that there was a defect, is not sufficient. Not only so, but under the averments of the declaration, the proof must also show that the defect causing the injury was known to the defendant, or by the exercise of reasonable care, it could have been known. There is an absence of proof as to when the defect, if it can be so called, in the spring or following plate, mentioned by the appellee, occurred, or that appellant knew, or could have known by the exercise of reasonable diligence, of such defect, even if it is assumed such defect was the cause of the injury. . . .

[We find] that John H. Dixon — the appellee — was injured while in the employ of the appellant and in the line of duty, in attempting

to make a coupling of cars that were supplied with the Ames coupler — commonly called bull tongue coupler — both couplers on the cars being at the time defective, which was known to appellee, but for which defect so known there is no claim for a recovery in this case, the recovery being based on the loose motion of one of the drawbars,

which in that respect was claimed to be defective, but which we find did not cause or contribute to the injury, even if defective in the respect claimed. We find there is no proof of a defect in the couplers of the cars, that caused the injury. The clerk will enter this in the final order.

12. FOOD ADULTERATION CASES. (C. AINSWORTH MITCHELL. *Science and the Criminal*. 1911. p. 218.) . . .

To the layman it may seem strange that a conflict of opinion should ever occur between analysts with regard to the genuineness of a sample of food, and that it should ever be possible for an accused salesman to bring rebutting scientific evidence. A consideration of the following points, however, will make this clear, and show how such different opinions may be honestly held. (1) Food products may consist of entirely dissimilar substances which may readily be distinguished by suitable tests, as, for instance, pepper and salt; or (2) the food may contain a special constituent which is either entirely wanting or only present in a smaller proportion in other allied products. It is mainly with foods of this latter description that the difficulties of the public analyst arise. For instance, butter fat contains a large proportion of certain volatile compounds, which are either absent or are present in much smaller quantity in the fats used to adulterate butter; and thus an estimation of these volatile compounds affords a means of judging of the purity of the butter. Thus, if only half the normal quantity of volatile compounds is present, the conclusion is drawn that the butter is adulterated with an equal quantity of foreign fat, and so on. The task would not be difficult if butter fat were always constant in composition; but, unfortunately, there are often wide variations in the proportion of ingredients, and it fre-

quently happens that the public analyst has to give his judgment upon a sample, which might either be a butter very rich in the characteristic volatile substances and adulterated with 10 per cent of foreign fat; or it might be a genuine butter that was very deficient in these volatile compounds. This, then, is the dilemma. If the analyst condemn such a sample on the strength of this and other tests, he may be confronted by the evidence of other analysts who will give their opinion that the butter is genuine; and if, then, the matter be referred to the Government analysts, their report may or may not corroborate his, and in the latter alternative the authority instituting the prosecution may have to pay heavy costs. It is well known that butters are scientifically blended with foreign fats so as to fall just on the border line between abnormal and adulterated samples, and the analyst is frequently compelled to pass such a butter as genuine, lest he should unwittingly do an injustice. . . .

These details have been given at some length, for they are typical of the problem which the public analyst has to solve in the case of many natural products, *i.e.*, to decide whether a food is adulterated or only naturally of poor quality. There is no special difficulty in the analyses; it is a question of interpretation of the results. The chief culprit in the matter of the

adulteration of butter is the small dealer, who buys margarine from the margarine manufacturer and skillfully blends it with butter in a proportion that is small in a single instance, but is sufficient to bring him in a handsome profit in the course of a year.

Owing to the difficulty of detecting such small additions of margarine to butter (which, as was explained above, is due to the variations in the natural product) a most ingenious device has been adopted in some countries. This is the addition of a small quantity of a "latent color" to the margarine, so that, although it appears yellow, like butter, its color can be changed by the application of a single reagent to pink or blue, and its presence thus revealed in a mixture of butter and margarine. Several years ago an attempt was made in some of the United States to compel manufacturers of margarine to color it pink, so that it could not possibly be palmed off as butter, but as this law was found to have the effect of stopping the sale of margarine altogether, it is no longer enforced. Various substances have been suggested as suitable for the latent coloring matter, such as starch, which turns blue on contact with iodine, and certain colorless coal-tar derivatives which change to pink upon the addition of an alkali or acid. There are numerous ob-

jections to the use of some of these compounds. Thus, starch may be washed out of the margarine by a simple treatment with water, while a coal-tar derivative that turns pink on contact with an alkali is too sensitive an ingredient for everyday use. A far more satisfactory substance than any of these was found in the oil derived from sesame seed. This is a wholesome oil with a fragrant odor and pleasant taste, which is largely used as a salad oil in certain parts of Europe. It is one of the few vegetable oils that can be detected by means of a special color reaction; for on treating the oil with a particular reagent it gives a bright rose color, and the test is so sensitive that it will detect the presence of even a small percentage of sesame oil in other fats. A compulsory addition of a small amount of sesame oil to all margarine, therefore, affords an absolutely certain means of recognizing the margarine subsequently. The first country to adopt this plan was Germany, where a few years ago a regulation was made that all makers of margarine must use 10 per cent of sesame oil with the other ingredients. Belgium has also adopted the same plan of earmarking the margarine produced in the country, and has thus simplified in one direction the problem of detecting petty adulteration.

13. POISON TESTS. (WILLIAM JAGO. *A Manual of Forensic Chemistry and Chemical Evidence*. 1909. ch. VI, p. 140.) . . .

Character of Articles submitted to chemist. — These may include the stomach or other organs of the body; urine or other secretions of the body; vomit; medicine; food; contents of drinking vessels, etc.

Previous History of These. — As a rule all these articles are first collected by some person other than the chemist, such as a policeman. A non-professional man should, if possible, touch nothing, and see that

nothing is touched. To this there is the exception of something that will be lost if not at once recovered. For example, a woman was found dead, with vomit near the mouth running away and soaking into the floor. This should be collected at once with a clean spoon in a clean vessel.

An Expert Medical Man will, on arrival, take note of everything, preserve all necessary articles, put

in proper vessels, seal, and arrange for personal delivery to the chemist. On *post mortem* examination the operator will take precautions for the proper packing of essential organs of the body and other substances therefrom requiring to be analyzed.

Exact particulars of delivery and receipt of Articles.—The chemist should ascertain as much as possible of the previous history of the case, such as the symptoms preceding death. He should also acquaint himself with the circumstances under which any articles were found, *e.g.*, articles of food, suspected poison, etc., whether in clean vessels or the reverse. Also vomit, whether in clean vessel or possibly collected from a dirty floor. The nature and efficiency of packages, how fastened, and what identifying marks or seals must also be noted. A record of when and where received and from whom must also be made and kept.

Condition when received.—Note minutely whether seals or packages are entire or show any sign of having been tampered with; also whether putrefactive or other changes have occurred in the contents.

Custody during analysis.—If possible, all articles should be kept in the direct personal custody of the chemist. They must be securely locked up during his absence; products, etc., must be labeled at each stage of the work. If any article or portion of article is given to any other chemist or expert, it must be handed over personally, together with a written description. A note must be made of the time, place, and person. At the close of the investigation any remainders must be sealed up in proper vessels, labeled, and kept in safe custody. Or if directions have been received to hand them to some other person, a note must be made of full particulars of the articles handed over, their nature and state, and time when, and place where, and person to whom so handed.

Preservation.—No antiseptics are admissible. Obviously one must not introduce a foreign matter. It is dangerous to heat since some of the substances may be volatile. Cold storage is permissible. If spirituous extracts are to be made, at an early stage one may macerate with the spirit, and thus incidentally preserve from putrefaction. . . .

Accuracy of Analysis.—The analyst should be able to speak as to the accuracy of his modes of analysis and their limitations. He should also have tested the accuracy of the calibration of his instruments, pipettes, burettes, flasks, hydrometers, etc.

Substances obtained by analysis must be kept.—The active substance may possibly be isolated, in that case it must be carefully preserved for production if necessary, *e.g.*, samples of arsenic, aconitine, etc.

Form and strength of poison administered.—If possible, the analyst should determine the form in which the poison was given, *e.g.*, if morphia, whether as opium, laudanum, or salt of alkaloid. In the matter of strength he should, if able, decide whether given in concentrated or in diluted condition.

Organs or Secretions of body in which found.—These must be noted, as thereby indications of the nature of the poison and the length of time during which it was being administered, are afforded.

Amount of fatal dose.—The analyst should be able to state the amount of fatal dose and its relation to the sex, age, and state of health of the deceased. He should ascertain the proportion such dose bears to the quantity found on analysis. He should further be able to state what relation this quantity found bears to the quantity administered.

Possible existence of poison naturally in the body.—The poison may have been given as a medicine; for example, arsenic, antimony, and strychnine are all recognized drugs. Or it may have been absorbed

during the natural avocations of the person; thus lead poisoning frequently occurs in the case of potters working with lead glaze.

Another alternative is that the poison may have been present in food. Thus prussic acid is formed from bitter almonds, and also may be obtained from other fruit kernels. A well-known anecdote is that of counsel who advanced the theory that a person, in whose body prussic acid was found, had himself introduced it by chewing and swallowing apple-pips. The defense was ineffective, except that for long after the barrister was familiarly known as "Apple-pip Kelly."

Poison, the result of decomposition.—As a result of certain obscure chemical changes which may occur within the body after death, there may be poisonous bodies produced from non-poisonous substances in the body. These are known as cadaveric alkaloids, or more usually as "ptomaines." As the naturally poisonous alkaloids may possibly be confused with ptomaines, evidence differentiating the two classes of bodies should be forthcoming.

Introduction of poison by impure analytic reagents.—This is not an unknown experience, thus arsenic has actually been introduced, by means of the reagents, into the Marsh's and Reinsch's tests by which substances were being examined for its presence.

Introduction by improper wrappers.—The obvious duty of the person forwarding articles for analysis is to see that they are packed in proper receptacles. The chemist can only deal with them as they reach him, but he should be on the alert for the discovery of any improper wrapper. Thus a case is on record of a stomach, suspected to contain arsenic, having been packed in a piece of wall paper. The wall paper itself on examination was found to contain arsenic in abundance.

Chemical Evidence for Defense.—

The first duty of a chemist who is acting for the defense is to scrutinize most closely the whole chain of evidence for the prosecution. The preceding directions as to the precautions necessary to insure its completeness should also furnish suggestions to the defense as to the tests to which it may be subjected in order to find any defects in case of their existence. If, for example, the circumstances of death point to a possibility of ptomaine poisoning having been the cause, this should be pressed in cross-examination of witnesses for the prosecution. Such a possibility should be supported by direct chemical evidence that the analytical results are compatible with death from such a cause. Granted any reasonable case for death being due to other causes, or that death by poison has resulted from any innocent source, the defense must be prepared with all the constructive evidence necessary to build up an affirmative case. This will include evidence in support of the whole chemical argument (and of course equally of the medical one, though the latter at present only indirectly concerns us).

Illustrative Cases.—In the following poisoning cases an account is given of the more important chemical evidence.

R. v. Smethurst.—On the 7th July, 1859, Smethurst was tried at the C. C. C. for the murder of Isabella Banks, who died on the 3d May, 1859. A motive for the alleged murder existed. The symptoms of illness preceding death were as follows:—diarrhoea and vomiting, dysentery, heat and burning throughout the whole alimentary canal. These pointed to the administration of some irritant poison. No poison was traced to the prisoner's possession, but he as a doctor would have no difficulty in procuring same. *Chemical Evidence for the Prosecution.* A part of a motion was analyzed by Dr. Taylor, who found it to contain

arsenic. The following report of the evidence is abstracted and condensed from Vol. 50, C. C. C., Sessions Cases, p. 552. Taylor in *examination in chief*, deposed that on the 1st May, he received a parcel delivered by Buzzard. This contained two bottles, which were sealed; he opened one and took out a portion.¹ Before commencing his analysis, he first tested his apparatus and reagents, copper wire, hydrochloric acid, water, and test tube; he found them all perfectly clean.² He then used the same reagents and apparatus, and tested some of the liquid from the bottle he had opened. The result was a metallic deposit of a grayish steel color on the copper. This might be arsenic or antimony, or possibly mercury. The bottle was then re-sealed in his presence, and taken away by Buzzard.³ He made further experiments with some more of the liquid, and obtained a further deposit of gray matter. This he examined under the microscope, and found it to have the appearance of arsenic. He heated a piece of the copper on which was the deposit, and obtained crystals of arsenic. These he produced.⁴ He had not the slightest doubt of their identity. There was no indication of the presence of antimony, mercury, or bismuth. He found that arsenic was contained in the blood. On the 5th May, he received a large jar from M'Intyre, sealed up — this contained viscera, stomach unopened, and other organs enumerated. On the 7th May, and on other specified dates he received other packages, labeled, and numbered them.⁵ On examination he found no arsenic or antimony in the gullet or stomach. He found

antimony in two places in the intestine, and traces of antimony in blood taken from the heart. He was assisted by Dr. Odling.⁶ He examined a number of articles of food and medicine. Bottle No. 5 contained 355 grains chlorate of potash — free from anything else — it is not muriate of potash (KCl). Bottle No. 21 contained a clear watery liquid of saline taste. Handed 1½ oz. from it to an assistant to boil for Reinsch's test. The copper was destroyed by being dissolved. He plunged a portion of fresh copper in the solution for a very short time, and found arsenic deposited on it. Subsequent examination showed no arsenic or antimony in the liquid, but that the arsenic found in the original test had come from the copper used for the experiment.⁷ In the ordinary mode of applying the test, witness added, "We never dissolve the copper." On *cross-examination* by Parry. When giving evidence before the magistrate, he believed that this bottle contained arsenic. Subsequent examination showed that the original analysis was mistaken. On *re-examination* by Bodkin. If half a grain of copper was administered during life, there would not be any action of acid in the stomach that would account for the arsenic in the evacuation.⁸ Slight traces of arsenic were found in the copper pills, but none in those of bismuth. Odling, on examination, stated that in a case where the copper is not dissolved there is no fallacy in Reinsch's test. *Chemical Evidence for Defense*. B. Ward Richardson was examined by Giffard. Slow arsenical poisoning is quite impossible without arsenic being found

¹ The witness states the time when, and the person from whom he received the articles for analysis, also the mode of packing, and that they were sealed.

² All apparatus was tested before use.

³ States what was done with the bottle when finished with.

⁴ Produced in court the substance isolated.

⁵ All packages labeled and numbered.

⁶ Gives name of assistant whose qualifications were well known.

⁷ Example of the poison being searched for having been introduced in the reagents.

⁸ Medicines administered could not have been the source of the poison found on analysis.

in the tissues.¹ He experimented on a dog, giving it white arsenic and potassium chlorate in excess, the latter being a diuretic — he subsequently found arsenic in the dog's tissues. Various medical witnesses averred that the symptoms were not those of slow poisoning, but of dysentery. The jury believed the chemical evidence for the prosecution and found the prisoner guilty.

STEPHEN, J., comments somewhat fully on this case in his "Criminal Law of England," p. 305. He remarks that Taylor's credit was attacked because on the copper gauze being dissolved by the potassium chlorate, and arsenic liberated, Taylor assumed that the arsenic came from the liquid being tested. The defense tried to draw the inference that his whole evidence was unreliable. But examining that evidence, altogether 77 experiments were made, in four no copper was dissolved and no arsenic was found. In two tests no copper was dissolved and arsenic was found. In one test, the copper was dissolved and arsenic from the copper was found, thus showing that the test will reveal arsenic. The 74 experiments show that when there is no solution of copper, the test does not reveal arsenic unless it is free in the liquid, as distinct from being combined with the copper. A second argument was based on Richardson's evidence, that arsenic must be found in the tissues in a case of arsenical poisoning. In the judge's opinion, absence of arsenic at death does not show that no arsenic was given during life, but that none was given for the last two or three days of life. The third argument of the defense was that Taylor found antimony and arsenic present in the medicines, which contained bismuth, and therefore in that way such arsenic as was found could be accounted for. An attack was made on the credit of the

witnesses for the defense, on the ground that they had also given evidence for the defense at Palmer's trial. Richardson then deposed that Cook's symptoms were those of angina pectoris, and Rogers that if death were due to strychnine, that poison ought to have been found in the body. After the sentence, petitions and other documents were sent to the judge (L. C. Baron Pollock), among them being a communication from Drs. Baly and Jenner on the medical evidence, they regarded the symptoms and post-mortem appearances as ambiguous, and thought they might be due either to natural causes or poison. The judge recommended the Home Secretary to refer the matter to the judgment of some independent medical and scientific persons selected by himself. Herapath meanwhile had written a letter to "The Times" asserting that Taylor had extracted more arsenic from the potassium chlorate and copper than could have been set free by the solution of the copper. The Home Secretary sent the papers to Sir Benjamin Brodie, the eminent surgeon, who reported on the materials supplied him, that there were six reasons for believing Smethurst guilty, and eight for doubting the same, and concluded — "I own that the impression on my mind is that there is not absolute and complete evidence of Smethurst's guilt." The Home Secretary thereon granted a free pardon. . . .

R. v. Maybrick.—On the 31st July, 1889, Florence Maybrick was tried at the Liverpool Assizes for the murder of James Maybrick, her husband, who died on the 11th May, 1889. The alleged motive was intimacy with a man named Brierley. The symptoms of the fatal illness were agreed to be those of gastritis or some similar disease. According to the theory of the prosecution the

¹ Defense attacks the evidence for the prosecution on the ground that absence of arsenic from the tissues is conclusive evidence of absence of slow arsenical poisoning. Different argument and conclusion based on facts as advanced by the prosecution.

gastritis was due to administration of arsenic. According to the defense it was due to irritant food or cold through wetting. *Chemical Evidence for the Prosecution.* Nokes, pharmaceutical chemist, had sold to the prisoner some fly papers containing arsenic, also at the time of purchases she paid for them, although she had a running account. They were delivered in the ordinary way by the boy. Hanson, pharmaceutical chemist, had also sold arsenical fly papers to the prisoner under the same circumstances of paying at the time, although she had a running account. At the same time he sold her a lotion containing benzoin and elder flower water, being the usual ingredients of a skin lotion. These mixed with the arsenic would make a good combination as a cosmetic.¹ Humphreys, surgeon, attended the deceased during his last illness, and gave him Fowler's Solution on 5th or 6th May. This contains arsenic, the total quantity thus administered was $\frac{3}{1000}$ grain. On the 9th he applied Reinsch's test to the fæces and urine — results negative; but he admitted inexperience in chemical testing, and hence possibly failed in detecting the presence of arsenic. Davis, analyst, deposed that a bottle of Valentine's Meat Juice handed to him contained $\frac{1}{2}$ grain of arsenic in solution. The normal preparation contained no arsenic. Some arsenic was present in the glass of the bottle, but less than in that of another bottle, the contents of which were arsenic free.² He found no arsenic in the stomach or spleen, but it was present in the liver and intestines. A number of bottles present in the house con-

tained arsenic, as did also a box labeled "poison for cats." One bottle was filled with a saturated solution of arsenic. A tumbler in a hat-box contained milk in which was a handkerchief. This milk contained arsenic equal to from 20 to 30 grains in the whole tumbler. He found arsenic in a jug in which some lunch for the deceased had been taken to his office. A bottle of glycerin in the lavatory contained arsenic, as did also one of deceased's medicine bottles. Stock bottles of the drugs from which the medicine was dispensed contained no arsenic.³ The fly papers contained arsenic. Witness produced tubes containing the characteristic sublimate from Reinsch's test, made respectively on the kidneys and liver. He calculated the quantity in the entire liver to be $\frac{1}{2}$ grain. The amount found was half the smallest amount that the witness had ever found in a fatal case of arsenic poisoning. Stevenson, analyst, stated that he had examined the contents of the stomach, and found no arsenic. In the intestines he found about $\frac{1}{11}$ grain of arsenic, and some arsenic in the kidneys. On examining the liver, 4 oz. yielded 0.027 grain of arsenic, equal to $\frac{1}{3}$ grain (0.33) for the whole liver, which weighed 3 lbs. On making a duplicate test, 8 oz. yielded 0.049 grain equal to 0.29 grain of arsenic for the whole liver.⁴ "The body at the time of death probably contained approximately a fatal dose of arsenic." He did not macerate the whole liver into one bulk.⁵ *For the Defense.* Various witnesses stated that the deceased was in the habit of taking arsenic as a medicine. In particular, Stanton,

¹ Evidence of purchase of arsenic under suspicious circumstances, but one witness admitted that the arsenic would make a good cosmetic. The use as a cosmetic might explain the secrecy of the purchase.

² The evidence here given had evidently been prepared in anticipation of a defense that the arsenic in the meat juice had been derived from the glass of the bottle.

³ Interesting as a tracing back of the history of the medicine, in order to prove that it contained no arsenic when originally prepared.

⁴ A duplicate test served the double purpose of confirming the accuracy of the first test, and also that the poison was fairly evenly distributed throughout the whole liver.

⁵ Evidently an answer given to a question foreshadowing one of the lines of defense.

a pharmaceutical chemist, sold the deceased a "pick-me-up" containing Fowler's Solution, 7 drops to the dose, sometimes as often as five times a day. The last occasion was in November, 1887; the quantity in the day was nearly $\frac{1}{2}$ grain of arsenic. On going away from home he took with him 8 or 16 dose bottles. Arsenic is used as an aphrodisiac.¹ Tidy, chemist, was of opinion that the symptoms and appearances were not those of arsenical poisoning. Stevenson assumed the quantity present to be 0.3 grain, but witness did not think that warranted. It is not fair to infer that all the intestines or liver contained the same proportion of arsenic as a portion. They should have been mashed up, and a uniform sample taken.² Witness calculated the total quantity of arsenic found to be 0.082 grain.³

This does not point to over administration. He cited various medicinal cases. No. 1, arsenic was given three months before death, there was found 0.028 grain of arsenic. In No. 2, arsenic was given five months before death, there was found in the liver 0.174 grain of arsenic. In these cases there was no suggestion of arsenical poisoning. Paul, examiner in Toxicology, Victoria University, had examined similar pans to that mentioned by Davis, and found arsenic in the glaze, which arsenic was set free by acids.⁴ *Prisoner's Statement.* She had used a cosmetic containing arsenic from fly-papers.⁵ Her husband had been taking a powder, this she mixed in with the meat juice at his request.⁶ The jury found the prisoner guilty. (*Times Report.*)

¹ Evidence of the deceased being an habitual arsenic taker.

² Goes to prove that the sample did not adequately represent the whole of the organ.

³ The calculation by which the witness arrived at the figure 0.082 grain is not very clear. If the amounts found in the two portions analyzed by Stevenson be added together the sum is 0.076, which is only 0.006 grain short of Tidy's estimated total. That 12 oz. of the liver should contain 0.076 grain, and the remaining 2 lb. 4 oz. only 0.006 grain, is exceedingly improbable.

⁴ It will be remembered that Davis found arsenic in the food sent to the deceased's office for his lunch. This is an attempt to prove that such arsenic was derived from the glaze of the containing vessel, from which it could be set free by any acids in the food.

⁵ This was an explanation of the reason for purchasing the fly papers. Compare with Note 1.

⁶ This was an explanation of the reason why arsenic was found in the meat juice. It would be strengthened by the evidence that the deceased was an habitual arsenic taker.

TITLE II: EVIDENCE TO PROVE IDENTITY

14. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹

Other Principles discriminated. In evidencing that proposition commonly spoken of as Identity, there is apt to be a confusion in thought with two other processes which are really not germane.

(1) It is perhaps natural to apply the notion of Identity or Identification to the general process of proving an accused person guilty. He is said to be "identified" as the murderer or the thief; *i.e.* the whole process of proof and the whole mass of evidence is thought of as involving the "identity" of the accused and the guilty person. From this point of view, all distinctions between the various sorts of evidence heretofore analyzed are merged and become useless. That the accused planned the act, had a motive for the act, bore traces of the act, and so forth, are all merely "identifying" facts; because the real guilty person also must have planned, had a motive, bore traces, and the like. Such an indiscriminate confusion and merger of all sorts of probative elements naturally excites suspicion of the propriety of the term "identification" as thus applied. In truth, there is no propriety in it. The very looseness of the term shows that, since the various sorts of evidence thus covered by it may be further analyzed and separated, there would remain no specific need for the term "identity" and no specific class of evidence to which it was distinctively appropriate. If this were the true meaning of the term, it might be discarded altogether as superfluous. Yet the term does have a distinctive application.

(2) In arguing from subsequent traces of an act to the doing of an act, the argument of Identity sometimes is necessarily involved and needs to be distinguished. Suppose, for example, to prove a murder, evidence is offered that a gun found three days later in the defendant's possession is exactly fitted by a bullet found in the body of the deceased. Here there are two inferences involved: (a) "Because the defendant possessed the gun when found later, therefore he probably possessed it at the time"; this inference is always open to doubt, since the defendant may have borrowed the gun since the killing, or some third person may have surreptitiously placed the gun on his premises; (b) "Because the gun, thus possessed by the defendant at the time of the killing, fitted the bullet found in the body, therefore the defendant's gun must be the one that shot the deceased"; here the inference is open to doubt because the bullet may fit other guns, *i.e.* the fitting of the bullet is not a necessary mark of the identity of the gun that shot it. Now the first inference is an inference from subsequent traces to the former act of possession or use of the gun; no question of identity is involved. It is the second inference that involves the element of the identity. This is why much of the evidence herein termed Traces, as pointing back to an Act (*post*, No. 139), may incidentally involve a question of Identity.

¹ Adapted from the same author's *Treatise on Evidence* (1905. Vol. I, §§ 410, 411).

General Principle of Identity Evidence. Identity may be thought of as a quality of a person or thing, — the quality of sameness with another person or thing. The essential assumption is that two persons or things are thought of as existing, and that the one is alleged, because of common features, to be the same as the other. The process of inference thus has two necessary elements: (1) it is a Concomitant one, in its logical scheme (*ante*, No. 3); and (2) it operates by comparing common marks, found to exist in the two supposed separate objects of thought, with reference to the possibility of their being the same. It follows that its force depends on the *necessariness of the association between the mark and a single object*. Where a certain circumstance, feature, or mark, may commonly be found associated with a large number of objects, the presence of that feature or mark in two supposed objects is little indication of their identity, because, on the general principle of Relevancy (*ante*, No. 2, § 2), the other conceivable hypotheses are so numerous, *i.e.* the objects that possess that mark are numerous and therefore two of them possessing it may well be different. But where the objects possessing the mark are only one or a few, and the mark is found in two supposed instances, the chances of the two being different are *nil* or are comparatively small. Hence, in the process of identification of two supposed objects, by a common mark, the force of the inference depends on the *degree of necessariness of association of that mark with a single object*.

For simplicity's sake, the evidential circumstance may thus be spoken of as "*a mark*." But in practice it rarely occurs that the evidential mark is a *single* circumstance. The evidencing feature is usually a group of circumstances, which as a whole constitute a feature capable of being associated with a single object. Rarely can one circumstance alone be so inherently peculiar to a single object. It is by adding circumstance to circumstance that we obtain a composite feature or mark which as a whole cannot be supposed to be associated with more than a single object. The process of constructing an inference of identification thus consists usually in adding together a number of circumstances, each of which by itself might be a feature of many objects, but all of which together can conceivably coexist in a single object only. Each additional circumstance reduces the chances of there being more than one object so associated. The process thus corresponds accurately to the general principle of Relevancy (described *ante*, No. 2, §§ 2–4). It may be illustrated by the ordinary case of identification by name. Suppose there existed a parent named John Smith, whose heirs are sought; and there is also a claimant whose parent's name was John Smith. The name John Smith is associated with so many persons that the chances of two supposed persons of that name being different are too numerous to allow us to consider the common mark as having appreciable probative value. But these chances may be diminished by adding other common circumstances going to form the common mark. Add, for instance, another name circumstance, — as that the name of each supposed person was John Barebones Bonaparte Smith; here the chances of there being two persons of that name, in any district however large, are instantly reduced to a minimum. Or, add a circumstance of locality, — for example, that each of the supposed persons lived in a particular village, or in a particular block of a certain street, or in a particular house; here, again, the chances are reduced in varying degrees in each instance. Or, add a circumstance of family, — for example, that each of the persons had

seven sons and five daughters, or that each had a wife named Mary Elizabeth and three daughters named Flora, Delia, and Stella; here the chances are again reduced, in varying degrees, in proportion to the probable number of persons who would possess this composite mark. In every instance, the process depends upon the same principle, — the extent to which the common mark is capable of being associated, in human experience, with more than one object.

In accordance with the general principle of *Explanation* (*ante*, No. 2, § 5), the party denying the identity may show that there are numerous objects equally possessing the evidential mark offered, so as to show that the chances of the two supposed objects being the same are very small. It may also be noted that a mark of identity may be *negative* as well as affirmative; *i.e.* where a certain circumstance would be necessarily associated with an object in issue, the lack of that feature in a particular object offered tends to show that it cannot be the object in issue, — in analogy with the argument from essential inconsistency (*post*, No. 55).

15. G. F. ARNOLD. *Psychology applied to Legal Evidence*. (1906. p. 356.)

In trying to arrive at the nature of Identity we are forced to a certain extent to discuss Metaphysics: this is unavoidable, and it is the neglect of what Metaphysics teaches which has in our opinion led to the confusion and contradictions on the subject which exist in the law.

We shall begin by insisting on a few propositions: viz. (1) that you cannot be aware of identity unless you have also diversity; (2) that you cannot ask whether a thing is generally the same, but you must confine your questions to a certain aspect of it; (3) that we select that aspect to suit our interests, and such interests are usually practical; (4) that identity or the relation of sameness is ideal, it lies in the view we take of things, and not in the nature of things themselves; (5) that the word "same" is used ambiguously and that it is a different problem when we ask whether an individual *remains* the same, and when we ask whether two things *are* the same.

(1) The first proposition applies whether we are speaking of the resemblance of two things or of the continuous identity of one. "In order that the mind may perceive the resemblance between two images," says Binet, "they must differ a little; if they do not, they become added together and form a single image."¹ . . . Professor Sully writes: "The visual recognition of a thing as identical with something previously perceived takes place by help of the idea of persistence. . . . (It involves) the comparison of successive impressions and the detection of similarity and diversity of change. Thus a child learns to recognize his hat, etc., by discounting a certain amount of dissimilarity."²

(2) If the persistence is in the object itself, this implies a sameness of character attaching to the thing itself, *i.e.* a qualitative sameness, and further the avoidance of any absolute break in its existence. When, however, it is asked in what the sameness of quality consists, it will be found that no reply can be given, unless the point or particular respect of which you were thinking is specified. A general reply cannot be given because we do not know the general character which is taken to make the thing's essence; it is not always material substance, nor shape, nor size, nor color. The identity lies

¹ Binet, *Psychology of Reasoning*, p. 120.

² Sully, *Outlines of Psychology*, p. 155.

really in the view we take of it, and that view is often a mere chance idea; the character therefore lies outside of and beyond the fact taken. . . .¹

(3) How then do we determine in what respect we shall ask of a thing whether it is the same or not? Professor Stout seems to have answered this question in his remarks on what he calls "thinghood." It depends on interest: we take what answer for practical purposes as real, identical, etc.: on the perceptual level this interest is purely practical. It is the interest of the moment which determines how we look at a thing, and we look at it differently, according to the fluctuation of interest.² And this is why we say that the rule of convenience is the one to be followed in deciding whether events belong to the same transaction or not. Our interest here is solely as to how we shall dispose judicially of the charges brought against the accused in the most convenient manner, and the considerations which chiefly influence us are whether the same witnesses can speak to all the charges and whether those charges can be kept separate before the mind without risk of confusion or prejudice, if they are taken together. The fact that the events happened at different times and places and such like reasons are irrelevant in themselves save in so far as they hinder or promote our convenience. . . . To seek to convert such reasons into an objective general test of identity and difference seems to us both meaningless and irrational. . . .

(4) The relation of Similarity to Identity will now be described. "Similarity," says Bradley, "is nothing in the world but more or less unspecified sameness." "The feeling that two things are similar need not imply the perception of the identical point, but none the less this feeling is based always on partial sameness,"³ and elsewhere he says that Resemblance is the perception of the more or less unspecified identity of two distinct things. It differs from identity in its lowest form, *i.e.* where things are taken as the same without specific awareness of the point or sameness and distinction of that from the diversity, because it implies the distinct consciousness that the two things are two and different. It differs again from identity in a more explicit form because it is of the essence of Resemblance that the point or points of sameness should remain at least partly undistinguished and unspecified. And, further, the feeling which belongs to the experience of similarity is different from that which belongs to the experience of sameness proper. But resemblance is based always on partial sameness, though the specific feeling of resemblance is not itself the partial identity which it involves, and partial identity need not imply likeness proper at all. The writer is aware that this view is disputed by more than one philosopher: they hold that Resemblance is not based on Identity, but is an ultimate idea, or even that Identity is based on Resemblance. Thus Binet writes, "to explain the resemblance between two states of consciousness by the *common* elements in the two states or by a partial *identity* of their elements, simplifies nothing at all. For it replaces the idea of resemblance by the ideas of identity and unity which are merely its derivatives. Resemblance is a single, ultimate, and irreducible idea."⁴ Similarly Professor James says, "So here any theory that would base likeness on identity, and not rather identity on likeness must fail;" again, "likeness must not be conceived as a

¹ Bradley, *Appearance and Reality*, pp. 73-74.

² Stout, *Manual of Psychology*, pp. 327 *et seq.*

³ Bradley, *op. cit.*, p. 348, and note 1.

⁴ Binet, *op. cit.*, p. 129.

special complication of identity, but rather that identity must be conceived as a special degree of likeness, . . . likeness and difference are ultimate relations perceived. As a matter of fact no two sensations, no two objects of all those we know, are in scientific rigor identical. We call those of them identical whose difference is unperceived. Over and above this we have a *conception* of absolute sameness, it is true, but this, like so many of our conceptions, is an ideal construction got by following a certain direction of serial increase to its maximum supposable extreme. It plays an important part among other permanent meanings possessed by us in our ideal intellectual constructions. But it plays no part whatever in explaining psychologically how we perceive likenesses between simple things.”¹ We remember to have read in a judgment of one of the Indian High Courts (unfortunately we cannot now give the reference) that the judges considered the case was not proved because the evidence only established likeness and not identity, and it is no uncommon thing to hear evidence given that a witness can swear that two things or two persons are very like, but he will not swear that they are the same: such testimony is usually considered to fall short of an identification. Now if identity is based on resemblance, what more is required than the assertion that two things are very like? It is the fact that such questions arise in law that is our excuse for pursuing this controversy concerning Resemblance and Identity a little further. The position of the one side is that Identity is nothing more than a special degree of resemblance with the difference between the two objects unperceived; the contention of the other is that all resemblance is partial identity, but the points of sameness are not fully specified, and that terms such as “exact likeness” “precise similarity” are misleading. For as soon as you have removed all internal difference, and resemblance is carried to such a point that perceptible difference ceases, then you have identity. As soon as you begin to analyze resemblance you get something else than it, and when you argue from resemblance, what you use is not the resemblance, but the point of resemblance, and a point of resemblance is clearly an identity.

The physiological explanation, when one state of consciousness is said to revive a similar state, doubtless is that the two similar states have a numerically single nerve element as their basis; the two images put a common cell element in vibration and this is called an identity of seat.² This appears to us to point to identity being the ultimate state. But for the purpose of our discussion it seems clear that what is really the important matter is the amount of difference which is perceived; and we think that in most cases when a witness is able to swear to great likeness between two objects or persons and can specify the points of likeness, in the absence of any specified points of difference it should be accepted as an identification even though the witness shrinks from using that term. If an advocate persists in asking, “Will you swear that they are the same?” many witnesses will answer, No, and on paper and to the unreflecting mind this will considerably weaken the effect of the evidence. Such an advocate should be asked in his turn to define what he means by “same,” and if he attempts to do this, it will soon become apparent that his question as so addressed is not one that can be fairly given the direct answer, Yes or No. If the

¹ W. James, *Principles of Psychology*, Vol. I, pp. 532-533.

² Binet, *op. cit.*, pp. 125, 126.

witness attempts to give any other response, he is often charged with prevarication, whereas it is not his fault that he does so, but the form of his interrogator's question compels him to do it. In a case, *e.g.*, of the identification of stolen goods, the magistrate should not be influenced so much by the use of the words "like" and "same," but should rather get from the witness the points in which he is able to say that the objects correspond and those in which he is able to say that they differ. "Two objects are similar," says Wundt, "when certain of their characteristics correspond, while others are different"; and perfect likeness — to indicate which the term "identity" is sometimes used — whether of quality or of intensity, must be estimated for practical purposes by indistinguishableness when attention is closely directed to the two objects.

(5) At the same time it must be remarked that difference is not always fatal to identity. But here we are using "identity" in another sense. A quotation will explain this: "Real identity," says Dr. Ward, "no more involves exact similarity than exact similarity involves sameness of things; on the contrary, we are wont to find the same thing alter with time, so that exact similarity after an interval, so far from suggesting one thing, is often the surest proof that there are two concerned. Of such real identity, then, it would seem we must have direct experience; and we have it in the continuous presentation of the bodily self." . . . The same writer points out the ambiguity in the word "same" whereby it means either individual identity or indistinguishable resemblance: in the former we have mere oneness or singularity which entails no relation; in the latter there is a relation, for two individuals partially coincide. . . . Resemblance itself may be fatal to identification, when the law of being is changed. . . .

It is hardly necessary to concern ourselves further with this meaning of the term, though we have a few more remarks to make on the subject of Identification. One method of identification allowed in law is by showing the photograph of a person to the witness. . . . In the case of *R. v. Tolson*, 4 F. & F. 104, a photograph in a trial for bigamy was shown to two persons to identify on the ground that it was a permanent visible representation of the image made on the minds (the retinas of the eyes) of the witnesses by the sight of the person represented, so that it was "only another species of the evidence which persons give of identity, when they speak merely from memory." This reason does not appear to us to be correct; no photograph corresponds entirely to the mental image which we have of a man, but only contains certain elements which are the same. These elements not merely revive those corresponding to them in the image, but they further revive others which do not correspond but which were contiguous with the like ones in the past, and it is this whole often made up of many representations of the individual which is the mental image that we have of the person. It is a case of association of ideas both by similarity and contiguity, and not by similarity alone as the dictum quoted above implies. Hence Professor Stout, when explaining the uncertainty of revival says, "The points of difference in the given presentation preoccupy consciousness and have preformed associations of their own. The points of identity can only reproduce their contiguous associates by partially or wholly displacing the setting in which they are embedded in the given presentation, and by overcoming the reproductive tendencies

which attach to this presentation as a whole and to its specific constituents. In order that such obstructions may be overcome, the points of identity must have peculiar interest or impressiveness, or their performed association must in some other way be peculiarly favored, *e.g.* by frequent repetition, or by the general direction of mental activity at the moment." In short, the function of photographs, portraits, and the like is to call up not any image of the person as seen on one particular occasion, but the general idea or generic image that we have in our mind, and how that idea is formed has already been discussed in the chapter on the theory of the normal man. When, therefore, in the case of *Fryer v. Gathercole* (13 Jur. 542) PARKE, B., said, "In the identification of persons you compare in your mind the man you have seen with the man you see at the trial; the same rule of comparison belongs to every species of identification," the statement does not appear sufficient, for the words "the man you have seen" do not adequately describe the nature of the mental image employed. Nor do you compare generally: just as you must ask whether a man is identical in this or that respect, so you always compare in some special respect. Some theoretical or practical end is to be subserved by the comparison which takes place only in regard to the characteristics which happen to be interesting at the moment, other characteristics being set aside or disregarded as unimportant. This explains why persons often fail to observe suspicious facts or draw what appear to be obvious inferences. They do not make the necessary comparisons because they have not the necessary interest at the time: after they have been cheated, interest is aroused and in retrospect it looks very different. But judges overlook this and regarding the matter after the event, draw the conclusion that the complainant consented, was an accomplice, etc.

(6) Comparison of handwriting and identification by it next claims attention. Only two methods will be here considered, viz. that by which an admitted specimen of the person's handwriting is placed side by side with the handwriting in dispute, and compared by an expert, the jury, or the judge; and that by which a person who is acquainted with the handwriting of the individual through having seen it on previous occasions, is shown a writing in court and is asked to say from his general knowledge whether it is or is not that individual's handwriting. The methods are different.

(a) In the latter, which will be first discussed, the witness identifies the handwriting by reference to some general standard which exists in his mind. The general standard by which the witness recognizes the handwriting put before him must (it appears to the writer) be simply the general or universal idea which has already been fully discussed in the chapter on the theory of the normal man. It is in virtue of the common elements existing between the particular writing and the *general idea* of the handwriting in the witness's mind that the comparison is able to be made. "In comparison," says Professor Stout, "we first become conscious of the antithesis between the particular and the universal. The reason is that in it we become aware of the universal, as the common element which connects two clearly distinguished particulars. Thus the common element stands out in contrast to the differences; whereas in mere recognition no such contrast exists." We say the "general idea" and do not lay stress on the "generic image" because M. Binet has recently doubted the existence of

the latter. . . . It would, if this be so, be more correct apparently to say that it is in virtue of the general trend or channel of our ideas which is organized by thought on the occasion of each particular experience arising, that we recognize the particular handwriting shown us. It is the neural matter of the brain that is so affected by previous impressions made by the sight of such handwriting in the past that it responds at once to a similar impression now made by the sight of similar handwriting. But whether we speak of the influence of the trend of ideas or of awakening the generic image, it must be evident that the more examples of the handwriting which have been seen in the past, the deeper the impression which will have been made. . . . Perhaps it would more nearly express the nature of this general standard if we employ the term "general impression." Concerning these, Professor James says that they seem to be the impulsive result of summation of stimuli: they come about through the subject dispersing his attention impartially over the whole, surrendering himself to the general look. He thus gets a total effect in its entirety, which is lost upon the man who is bent on concentration, analysis, and emphasis. If the time is too short for the latter, it is best to abstain from analysis and be guided by the general look. The person who has the general impression does not give any reason for it, but he *feels* it is so. He is guided by a sum of impressions not one of which is emphatic or distinguished from the rest, not one of which is essential, not one of which is conceived, but all of which together drive him to a conclusion to which nothing but *that* sum total leads. The man, however, by seeking to make some one impression characteristic and essential, prevents the rest from having their effect. This remarkable passage is capable of many applications in law and is alluded to elsewhere in this work: it is here cited to assist in showing what the nature of the standard is, and to make it plain that it is idle to cross-examine a witness on the nature or composition of his general impression of a man's handwriting. From it we can also understand why the witness is able to give an opinion as to resemblance, for it was found that it was essential for the perception of resemblance, that there should be sameness in the two things, but that the points of the sameness should be partly undistinguished and unspecified (paragraph 4): and this appears to be exactly the basis of this species of identification. . . .

(b) In the other method, which is prescribed in §§ 45 and 73 of the Act (Indian Evidence Act), two or more writings are compared, and sometimes the opinion of an expert on handwriting is taken on them. What is important here is distinctness of the ground of comparison or common factor. . . . A difference in opinion of two persons concerning the identity of the handwriting on two papers may often be accounted for by the fact that one has a special aptitude for noting likenesses and the other for noting differences, and the practiced aptitude of each will further the detection of that relation. It is said, however, that more weight should be given to evidence of similitude than to that of dissimilitude, because it requires great skill to imitate handwriting, especially for several lines, while dissimilitude may be occasioned by a variety of circumstances, such as the health and spirits of the writer, the care used, the pen, ink, etc.¹ But there is another reason given which requires examination. "Handwriting,

¹ Lawson, *Expert Evidence*, 278.

notwithstanding it may be artificial, is always in some degree the reflex of the nervous organization of the writer. Hence there is in each person's handwriting some distinctive characteristic, which as being the reflex of his nervous organization, is necessarily independent of his own will, and unconsciously forces the writer to stamp the writing as his own. Those skillful in such matters affirm that it is impossible for a person to successfully disguise in a writing of any length this characteristic of his penmanship; that the tendency to angles or curves developed in the analysis of this characteristic may be mechanically measured by placing a fine specimen within a coarser specimen and the strokes will be parallel if written by the same person, the nerves influencing the direction which he will give to the pen."¹ Whatever writing may be in the adult, it certainly was not reflex action in the child, but much that originally required conscious effort with practice becomes automatic and mechanical and, with this qualification, we do not object to the description. Ribot, however, distinguishes writing from reflex movements proper, and the following quotation will show to what extent: "Reflex movements, whether reflex action proper, natural and innate, or reflex actions that are acquired, secondary, and fixed by repetition and habit, are produced without volition, hesitation, or effort, and may continue a long time without fatigue. They call into action in the organism only those elements necessary to their effectuation, while their adaptation to ends is perfect. In the strictly motor order of things, they are the equivalent of spontaneous attention, which similarly is an intellectual reflex action that presupposes neither choice nor hesitation nor effort, and may likewise continue a long time without fatigue. But there are other classes of movements that are more complex and artificial; as, for instance, writing, dancing, fencing, all bodily exercises, and all mechanical handicrafts. In these instances adaptation is no longer natural, but laboriously acquired. It demands the exercise of choice, repeated endeavor, effort, and at the outset is accompanied by great fatigue."² It seems necessary to try and determine to what extent writing is reflex and to what extent it can be modified by will, for it is apparent that if the claim of the experts in caligraphy is really correct, considerably more importance should be attached to evidence of handwriting than is usually done. It is a test of automatic actions that they do not involve attention but are fixed and uniform responses to the fixed and uniform recurrence of similar modes of stimulation. Now it appears to us that it would be untrue to say that writing does not involve attention; though the attention given is not a close one, it is to a certain extent controlled by vision, and we soon become aware of this if we try to write in the dark. Practice dispenses with that close attention to the detailed elements of the composite train which was necessary at first, and so the sensory elements become indistinct as compared with the motor ones, and the final result of the repetition is a habitual or quasi-automatic action in which all the psychical elements, presentations, and representations alike become indistinct. We do not believe, however, that the movements become so independent of the will that in forging or deliberately disguising the handwriting, where attention is preëminently displayed, the attention would not be likely to counteract the effects of habit.

² Ribot, *Attention*, p. 57.

16. THE CRANBERRY CASK CASE. (W. WILLS. *Circumstantial Evidence*. Amer. ed. 1905. p. 179.)

At the Spring Assizes, at Bury St. Edmunds, 1830, a respectable farmer, occupying twelve hundred acres of land, was tried for a burglary and stealing a variety of articles. Amongst the articles alleged to have been stolen were a pair of sheets and a cask, which were found in the possession of the prisoner, and were positively sworn to by the witnesses for the prosecution to be those which had been stolen. The sheets were identified by a particular stain, and the cask by the mark "P. C. 84." inclosed in a circle at one end of it. On the other hand, a number of witnesses swore to the sheets being the prisoner's, by the same mark by which they had been identified by the witnesses on the other side as being the prosecutor's. With respect to the cask, it was proved

by numerous witnesses, whose respectability left no doubt of the truth of their testimony, that the prisoner was in the habit of using cranberries in his establishment, and that they came in casks, of which the cask in question was one. In addition to this, it was proved that the prisoner purchased his cranberries from a tradesman in Norwich, whose casks were all marked "P. C. 84." inclosed in a circle, precisely as the prisoner's were, the letters P. C. being the initials of his name, and that the cask in question was one of them. In summing up, the learned judge remarked that this was one of the most extraordinary cases ever tried, and that it certainly appeared that the witnesses for the prosecution were mistaken. The prisoner was acquitted.

17. DOWNIE AND MILNE'S CASE. (W. WILLS. *Circumstantial Evidence*. Amer. ed. 1905. p. 73.)

On the trial of two men at Aberdeen autumn circuit, 1824, it appeared that a carpenter's workshop at Aberdeen was broken open on a particular night, and some tools carried off, and that on the same night the counting-houses of Messrs. Davidson and of Messrs. Catto and Co., in different parts of that city, were broken into, and goods and money to a considerable extent stolen. The prisoners were met at seven on the following morning in one of the streets of Aberdeen, at a distance from either of the places of depredation, by two of the police. Upon seeing the officers they began to run; and being pursued and taken, there was found in the possession of each a considerable quantity of the articles taken from Catto and Co., but none of the things taken from the carpenter's

shop or Davidson's. But in Catto and Co.'s warehouse were found a brown coat and other articles got from Davidson's, which had not been there the preceding evening when the shop was locked up; and in Davidson's were found the tools which had been abstracted from the carpenter's. Thus, the recent possession of the articles stolen from Catto and Co.'s proved that the prisoners were the depredators in that warehouse; while the fact of the articles taken from Davidson's having been left there, connected them with that prior housebreaking; and again, the chisels belonging to the carpenter's shop, found in Davidson's, identified the persons who broke into that last house with those who committed the original theft at the carpenter's. The prisoners were convicted of all the thefts.

18. THE CHICAGO ANARCHISTS' CASE. [Printed *post*, as No. 42.]

19. WEBBER'S CASE. (S. M. PHILLIPPS. *Famous Cases of Circumstantial Evidence*. No. LXX.)

On December 29th, 1876, a terrible disaster occurred at Ashtabula, Ohio, on the Lake Shore Railroad. The train fell through a bridge, and as the cars immediately caught fire, and a large number of the passengers were burned, the most of the bodies were so charred as to prevent recognition. Shortly after this accident, Mrs. Webber, who is a poor woman with two children, appeared in the office of a lawyer, in Rochester, N. Y., and stating that she had every reason to believe that her husband had been killed in that disaster, requested him to commence a suit against the railroad company on her behalf. The evidence which she offered to introduce in proof of her husband's sad fate was only of a circumstantial nature, as nothing was ever found of the body, which was supposed to have been consumed in the flames. She had been to Ashtabula, and in the débris of the wrecked train she had found a bunch of keys which she positively recognized as those having been in the possession of her husband. One of these keys, in further proof, she had ascertained exactly fitted the lock in her house, and an Auburn man was ready to swear that he had made such a key for the deceased. Another key fitted a chest which she had in her possession, while still another of the keys fitted the lock on the door. But the strongest proof of all which she had discovered was a piece of cloth, which she had recognized as having been part of her dead husband's coat. The proof by no means stopped here, however.

A physician of Rochester, who knew Mr. Webber, testified that he rode to Buffalo on the same train with the deceased on the fatal 29th of December; while another gentleman testified to seeing deceased take the train at Buffalo which went to ruin at Ashtabula. With this all but positive proof that the husband was among the victims of the disaster, the suit was commenced, the funds enabling her to carry it on being supplied by a kind-hearted gentleman. When the railroad company's attorneys were confronted with the proofs of the plaintiff's case, they advised a settlement with her for \$4000. But she wanted \$5000 or nothing, and the company's lawyers concluded to let the matter go before the Courts. The investigations concerning the fate of the husband were continued, and it was ascertained that he had been sent by Gen. Martindale, his former superior officer in the army, to the Pension Home in Wisconsin, several days previous to the Ashtabula disaster, and this fact soon brought to light the very important disclosure that a man of his name, answering his description exactly, and who stated that he had a wife and two children in Rochester, was still alive and safe in that institution, and that he was not near Ashtabula at the time of the disaster. The case is a most remarkable one, however, from the fact that no person doubted the truthfulness of the witnesses whose evidence formed the basis on which the suit was commenced.

20. THE TICHBORNE CASE.

The Doctrine of Coincidences. — [The general story of this case is stated *post*, in No. 147.] I proceed to state the leading principle, which governs the Tichborne case thus

(CHARLES READE. *Readiana*. p. 72.) narrowed, and — always implied, though unfortunately never stated — led our courts to a reasonable conclusion. That principle is: *the progressive value of proved coinci-*

dences all pointing to one conclusion. Pray take notice that by "proved coincidences" I mean coincidences that are: 1. Not merely seeming, but independent and real. 2. Either undisputed or disputable. 3. Either extracted from a hostile witness; which is the highest kind of evidence, especially where the witness is a deliberate liar; or 4. Directly sworn to by respectable witnesses in open court, and then cross-examined and not shaken — which is the next best evidence to the involuntary admissions of a liar interested in concealing the truth.

A single indisputable coincidence raises a presumption that often points towards the truth. A priori what is more unlikely than that the moon, a mere satellite, and a very small body, should so attract the giant earth as to cause our tides? Indeed for years science rejected the theory; but certain changes of the tide coinciding regularly with changes of the moon wore out prejudice, and have established the truth. Yet these coincident changes, though repeated ad infinitum, make but one logical coincidence. On the other hand, it must be owned that a single coincidence often deceives. To take a sublunary and appropriate example, the real Martin Guerre had a wart on his cheek; so had the sham Martin Guerre. The coincidence was genuine and remarkable: yet the men were distinct. But mark the ascending ratio — see the influence on the mind of a double coincidence — when the impostor with the real wart told the sisters of Martin Guerre some particular of their family history, and reminded Martin's wife of something he had said to her on their bridal night, in the solitude of the nuptial chamber, this seeming knowledge, coupled with that real wart, struck her mind with the force of a double coincidence; and no more was needed to make her accept the impostor, and cohabit with him for years.

Does not this enforce what I

urged in my first letter as to the severe caution necessary in receiving alleged, or seeming, or manipulated coincidences, as if they were proved and real ones?

However, I use the above incident at present mainly to show the ascending power on the mind of coincidences when received as genuine. I will now show their ascending value when proved in open court and tested by cross-examination. A was found dead of a gunshot wound, and the singed paper that had been used for wadding lay near him. It was a fragment of the *Times*. B's house was searched, and they found there a gun recently discharged, and the copy of the *Times*, from which the singed paper aforesaid had been torn; the pieces fitted exactly. The same thing happened in France with a slight variation; the paper used for wadding was part of an old breviary subsequently found in B's house. The salient facts of each case made a treble coincidence sworn, cross-examined, and unshaken; hanged the Englishman, and guillotined the Frenchman. In neither case was there a scintilla of direct evidence; in neither case was the verdict impugned. I speak within bounds when I say that a genuine double coincidence, proved beyond doubt, is not twice, but two hundred times, as strong, as one such coincidence, and that a genuine treble coincidence is many thousand times as strong as one such coincidence. But, when we get to a five-fold coincidence real and proved, it is a million to one against all these honest circumstances having combined to deceive us. . . .

We have only to subject this hodge-podge of real and sham [in the Claimant's case] to the approved test laid down in my first letter, and we shall see daylight; for the Claimant's is a clear case made obscure by verbosity and conjecture in the teeth of proof!

A. He proved in court a genuine

coincidence of a corporal kind — viz., that Roger Tichborne was in-kneed, with the left leg turned out more than the right, and the Claimant was in-kneed in a similar way. This is a remarkable coincidence, and cross-examination failed to shake it. But when he attempted to prove a second coincidence of corporal peculiarities like the above, which being the work of nature, cannot be combated, what a falling off in the evidence. *B.* They found in the Claimant a congenital brown mark on the side; but they could only assert or imagine a similar mark in Tichborne. No viva voce evidence by eyewitnesses to anything of the sort. *C.* They proved, by Dr. Wilson, a peculiar formation in the Claimant; but instead of proving by some doctor, surgeon, or eyewitness a similar formation in Tichborne, they went off into wild inferences. The eccentric woman, who kept her boy three years under a seton, had also kept him a long time in frocks; and the same boy when a moody young man, had written despondent phrases, such as, in all other cases, imply a dejected mind, but here are to be perverted to indicate a malformed body, although many doctors, surgeons, and nurses knew Tichborne's body, and not one of all these ever saw this malformation which, in the nude body, must have been visible fifty yards off. In short, the coincidences *B* and *C* were proved incidences with unproved "Co's."

Failing to establish a double coincidence of congenital features or marks, the Claimant went off into artificial skin marks. Examples: Roger had marks of a seton: the Claimant showed marks of a similar kind. Roger had a cut at the back of his head, and another on his wrist; so had the Claimant. Roger had the seams of a lancet on his ankles; the Claimant came provided with punctures on the ankle. Roger winked and blinked; so did

the Claimant. . . . These doubtful coincidences were also encountered by direct dissidences on the same line of observation. Roger was bled in the temporal artery, and the Claimant showed no puncture there. Roger was tattooed with a crown, cross, and anchor by a living witness, who faced cross-examination, and several witnesses in the cause saw the tattoo marks at various times: and it was no answer to all this positive evidence to bring witnesses who did not tattoo him, and other witnesses who never saw the tattoo marks. . . .

But the Claimant also opened a large vein of apparent coincidences in the knowledge shown by him at certain times and places of numerous men and things known to Roger Tichborne. These were very remarkable. He knew private matters known to Tichborne and A, to Tichborne and B, to Tichborne and C, &c., and he knew more about Tichborne than either A, B, C, &c., individually knew. It is not fair or reasonable to pooh-pooh this. But the defendants met this fairly; they said these coincidences were not arrived at by his being Tichborne, but by his pumping various individuals who knew Tichborne: and they applied fair and sagacious tests to the matter. They urged as a general truth that Tichborne in Australia would have known just as much about himself, his relations, and his affairs as he subsequently knew in England. And I must do them the justice to say this position is impregnable. They went into detail and proved that when Gibbs first spotted the Claimant at Wagga-Wagga, he was as ignorant as dirt of Tichborne matters; did not know the Christian names of Tichborne's mother, nor the names of the Tichborne's estates, nor the counties where they lay. They then showed the steps by which his ignorance might have been partly lessened and much knowledge picked up; they showed a lady, who longed to

be deceived, and all but said so, putting him by letter on to Bogle — Bogle startled, and pumped — the Claimant showing the upper part of his face in Paris to the lady who wanted to be deceived, and, after recognition on those terms, pumping her largely; then coming to England with a large stock of facts thus obtained, and in England pumping Carter, Bulpitt, and others, searching Lloyd's, &c. Having proved the gradual growth of knowledge in the claimant between Wagga-Wagga and the Court of Common Pleas, they took him in court with all his acquired knowledge, and cross-examined him on a vast number of things well known to Tichborne. Under this test, for which his preparations were necessarily imperfect, he betrayed a mass of ignorance on a multitude of things familiar to Roger Tichborne, and he betrayed it not frankly as honest men betray ignorance, or oblivion of what they have once really known, but in spite of such fencing, evading, shuffling and equivocating, as the most experienced have seen in the witness box. Personating a gentleman he shuffled without a blush; personating a collegian, he did not know what a quadrangle is. The inscription over the Stonyhurst quadrangle, "Laus Deo," was strange to him; he thought it meant something about the laws of God. He knew no French, no Latin. He thought Cæsar was a Greek. . . . To judge his whole vein of coincidences, and their neutralising dissidences, the jury had now before them three streams of fact: 1. That at Wagga-Wagga the Claimant knew nothing about Tichborne more than the advertisements told him; 2. That in England he knew an incredible number of things about Tichborne; 3. That in England he took Mrs. Towneley for Roger's sweetheart, and even at the trial was ignorant of many things Tichborne could not be ignorant of. Now, in all cases,

where there are several facts indisputable, yet seemingly opposed, science declares the true solution to be that which, setting aside the doubtful facts, reconciles all the indisputable facts. This maxim is infallible. . . .

I will now show, in contrast, the indisputable coincidences, which, converging from different quarters, all point to one conclusion — that the Claimant is Arthur Orton, of Wapping.

Arthur Orton, born September 13th, 1832, was the youngest son of George Orton, a shipping butcher and an importer of Shetland ponies. He used to ride the ponies from the Dundee steamers, and so got a horseman's seat. . . . The Claimant in Australia lived by riding, and slaughtering, and dressing beasts. On this point, his own evidence agrees with that of every witness who knew him. And when he came up the Thames in the "Cella" to personate Tichborne, he asked the pilot what had become of Ferguson, the man who used to be pilot of the Dundee boats. All this taken together is rather a strong coincidence. It may seem weak; but apply a test. To whom does all this, as a whole, apply? The riding — the slaughtering — and the spontaneous interest in an old Dundee pilot? To Castro? To Tichborne? To any *known* man not an Orton?

In 1848, Arthur Orton, aged 16, sailed to Valparaiso, and subsequently, in June, 1849, made his way to Melipilla. He was young, fair, the only English boy in the place, and the good people took to him. He made friends with Dona Hayley, wife of an English doctor, and with Thomas Castro and his wife, and many others. They were very kind to him in 1849 and '50, particularly Dona Hayley, and in these gentle minds the kindly feeling survived the lapse of time, and his long neglect of them. Not foreseeing in 1850 his little game in

1866, Arthur Orton told Dona Hayley he was the son of Orton, the Queen's butcher, and as a child had played with the Queen's children. Not being a prophet, all this bounce at that date went to aggrandise Orton. He spoke of Arthur's sisters by name, and Dona Hayley, twenty years after, remembered the names with slight and natural variations. . . . Tichborne's alibi during Arthur Orton's whole visit to Melipilla is proved by a cloud of witnesses, and his own writing, and is, indeed, admitted; he sailed late in 1852, and reached Chili in 1853. Arthur Orton was back in England, June, 1851. Now so much of this as respects Arthur Orton is the first branch of a pure, unforeseen coincidence. The second branch is this — The Claimant on the 28th August 1867 wrote from his solicitor's office, 25 Poultry, to prepare the good Melipillians for a new theory — that Arthur Orton, 17 years old to the naked eye, was not Castro — (that cock might fight in Hobart Town, but not in Melipilla); not Castro, but Tichborne, age 23. He wrote to Thomas Castro, complained he was kept out of his estates, and begged to be kindly remembered to Don Juan Hayley, to Clara and Jesusa, to Don Ramon Alcade, Dona Hurtado, to Senorita Matilda, Jose Maria Berenguel, and his brothers and others, in short, to twelve persons besides Castro himself. . . . The whole coincidence is this: The Claimant stayed a long time at Melipilla in 1849 and 1850, and called himself Arthur Orton, by giving full details of his family, and left Chili in 1850, during all which time an alibi is proved for Tichborne, but none can be proved nor has ever been attempted, for Arthur Orton. On the contrary, a non-alibi

was directly proved for him. He was traced from Wapping to Valparaiso, and Melipilla, in 1848. His stay there till 1850 was proved, and then he was traced in 1850 into the "Jessie Miller," and home to Wapping in 1851 just as he had been traced out — by ships' registers and a cloud of witnesses. The coincidence rests on the two highest kinds of evidence, the Claimant's written admission, and the direct evidence of respectable witnesses unshaken by cross-examination (see scale of evidence), and it points to the Claimant as Arthur Orton. Those who can see he is not Tichborne, but are deceived by the falsehoods of men into believing he is not Orton, should give special study to this coincidence; for here the Claimant is either Tichborne or Orton. No third alternative is possible. At Melipilla, in 1850, he was either Orton, who was there, aged 17, or Tichborne, who was in England, aged 23. . . .

Your readers, especially those who have paid me the compliment of drawing the circle with radii converging to one center, can now fill the interstices of those radii, and so possess a map of the fifteen heterogeneous and independent coincidences, converging from different quarters of the globe, and different cities, towns and streets, and also from different departments of fact, material, moral, and psychological, towards one central point, that this man is Arthur Orton. Then, if you like, apply the exhaustive method, of which Euclid is fond in his earlier propositions. Fit the fifteen coincidences on to Roger Tichborne if you can. . . . You will conclude with Euclid, "in the same way it can be proved that no other person except Arthur Orton is the true center of this circle of coincidences."

21. JOSEPH LESURQUES' CASE. [Printed *post*, as No. 359.]

22. THOMAS HOAG'S CASE. [Printed *post*, as No. 362.]

23. KARL FRANZ' CASE. [Printed *post*, as No. 388.]**24. THE WEBSTER-PARKMAN CASE.** (S. M. PHILLIPPS. *Famous Cases of Circumstantial Evidence*. No. VIII.)

This was an instance in which the guilt of a crime was brought home to the perpetrator through the indentifying of a body after it had been separated limb from limb, submitted to chemical processes, and to the inordinate heat of a furnace, and mingled with the countless bones of anatomical subjects in their common burying-place. One Professor Webster was brought to trial for the murder of Dr. Parkman. It was shown that the professor had urgent pecuniary motives, at the time when the crime was committed, to get Dr. Parkman out of the way. The prisoner had a residence at the Medical College, Boston. He made an appointment to meet the deceased at this place at two o'clock on Friday, the 23d of November, 1849, in order to discuss certain money matters. Dr. Parkman was seen about a quarter before two o'clock apparently about to enter the Medical College, and after that was never again seen alive. The prisoner affirmed that Dr. Parkman did not keep his appointment, and did not enter the college at all on that day. For a whole week nothing was discovered, and when search was made the prisoner interfered with it, and threw hindrances in the way.

On the Friday week and the day following there were found in a furnace connected with the prisoner's laboratory in the college, fused together indiscriminately with the slag, the cinders, and the refuse of the fuel, a large number of bones and certain blocks of mineral teeth. A quantity of gold, which had been melted, was also found. Other bones were found in a vault under the college. There was also discovered in a tea chest, and embedded in a quantity of tan, the entire trunk of a human body and

other bones. The parts thus collected together from different places, made the entire body of a person of Dr. Parkman's age, about sixty years, and the form of the body when reconstructed had just the peculiarities shown to be possessed by Dr. Parkman. In no single particular were the parts dissimilar to these of the deceased, nor in the tea chest or the furnace were any duplicate parts found over and above what was necessary to compose one body. The remains were further shown to have been separated by a person possessed of anatomical skill, though not for anatomical purposes.

Finally, three witnesses, dentists, testified to the mineral teeth found being those made for Dr. Parkman three years before. A mold of the doctor's jaw had been made at the time, and it was produced, and shown to be so peculiar that no accidental conformity of the teeth to the jaw could possibly account for the adaptation. This last piece of evidence was conclusive against the prisoner, and he was convicted. Without this closing proof the evidence would certainly have been unsatisfactory. The character of the prisoner, the possible confusion throughout the college of the remains of anatomical subjects, the undistinguished features, and the illusiveness of evidence derived from the likeness of a reconstructed body, were all facts of a nature to substantiate assumptions in favor of the prisoner's innocence. It is singular that the block of mineral teeth was only accidentally preserved, having been found so near the bottom of the furnace as to take the current of cold air, whose impact had prevented the thorough combustion that would otherwise have taken place.

25. FINGER-PRINT IDENTIFICATION. (C. AINSWORTH MITCHELL. *Science and the Criminal*. 1911. p. 51.)

The system of identification by bodily measurements, which has now come to be known as "bertillonage," was first introduced as a method of police registration in Paris in 1882. During the first year of its employment it detected forty-nine criminals giving false names, while in the following year the number rose to 241. In 1889, M. Bertillon stated that there had not been a single case of mistaken identity since the system had been introduced, and that in the previous year 31,849 prisoners had been measured in Paris, 615 of whom were in this way recognized as former convicts, while 14 were subsequently recognized in prison. Of the latter, 10 had never previously been examined, so that the failures were only 4 in 32,000, or 1 in 8000. The system, as described by M. Bertillon himself in a pamphlet on *The Identification of the Criminal Classes*, consists in taking the measurements of the body structure of each individual. Although such measurements might be indefinitely extended, the number is usually restricted to 12, including the height, length, and width of the head, length of the middle finger, of the foot, etc. These measurements are rapidly taken with standard instruments by a special staff, and are recorded upon a card upon which are pasted full-face and profile photographs of the prisoner. The data obtained enable the photographs to be classified into different groups of short, medium, and tall men, and these, again, may be subdivided into groups of short, medium, and long heads, while further subdivisions are afforded by the width of the head, width of the arms outstretched at an angle of the body, and so on. The color of the eyes affords the means for a further subdivision, while special birthmarks or peculiarities differen-

tiate the individuals still further. In this way alone, M. Bertillon claims that 100,000 persons can be classified into groups of ten each, the portraits in which would offer no difficulty in examination. M. Bertillon undoubtedly puts the position too favorably here, in assuming division into equal groups; for out of his hypothetical 100,000 individuals, 75 per cent might conceivably be tall men, and 75 per cent of these, again, have long heads, so that the final groups would in some cases have no representatives, while in the other groups there might be 1000 individuals. . . . A similar method is employed in the United States for recognizing deserters. . . . During the first five months after the system was instituted (1891) sixty-two men were suspected of concealing their identity, and in sixty-one of these cases the suspicion was justified and the identity acknowledged. A drawback of the Bertillon system of identification is that much depends upon the accuracy of the person who takes the measurements, and that, therefore, a permissible error must be admitted. In the United States Army an error of one inch in either direction is allowed for the recorded height. In addition to this, some degree of natural variation will take place in the course of years, and due allowance must also be made for this influence upon the measurements.

Striking as has been the success of M. Bertillon's system of anthropometrical measurements as a means of identification, it has been altogether surpassed in certainty by the methods of recording the impressions of the fingers. From time to time in the past, use has been made of a finger or thumb impression as a seal or to give a personal mark of authenticity to a document. One of the earliest ex-

amples extant of the use of the manual seal is to be seen on one of the Assyrian clay tablets in the British Museum. This is imprinted in cuneiform characters, and contains a notice of the sale of a field, which concludes with the imprint of a finger nail, and the statement that this had been made by the seller of the field as his nail mark. . . . The first attempt by Europeans to make use of the characteristic ridges of the fingers to record the identity of individuals appears to have been that of Sir William Herschel, who introduced a method officially into Bengal. His system arose out of the difficulty of checking forgeries by the natives in India, and his having made two of them record their finger impressions upon contracts, so that he might be able to frighten them should they subsequently deny their signatures. This was in 1858, and the device proved so unexpectedly successful, that for several years Sir William Herschel made a study of the use of finger prints in identification, and finally found them so satisfactory that, in 1877, he gave instructions for their systematic use in the Hooghly. . . .

The curious markings upon which are based these systems of identification are not confined to the human race, but are also shown by monkeys and to a less pronounced extent by other animals. The pattern upon the surface of the skin on the palms of the hands and soles of the feet is formed by the arrangement of what is known as the papillary ridges. It is readily recorded by carefully coating the finger-tips with a fine layer of printing or ordinary ink and pressing them upon paper so as to leave an imprint of the markings upon the finger. The uses of these ridges is to assist the delicacy of touch, and also to excrete perspiration through the minute pores with which they are covered. The effect of rough work upon the ridges is to increase

their height, and eventually they may become covered up by the horny accretions known as callosities. On the other hand, the ridges upon the palms of people who do very little manual labor are much less apparent, and when the skin is thin are very low. Hence, in the hands of bedridden invalids there is only a slight development of the ridges. Several circumstances may lead to a temporary obliteration of the ridges, such as, for instance, the constant puncturing of the skin by the head of a needle in sewing and the imprint of the forefinger of a tailor will therefore often present a very characteristic mottled appearance. . . . A most important point in the application of finger prints to the identification of the individual is the persistence of the main details throughout life, since otherwise much of the value of the method would be lost. . . . As is the case with all the other measurements of the human body, alterations will occur in the size of the markings; for the pattern as a whole increases with the growth of the finger, but this growth does not affect the arrangement of the loops and ridges that make up the markings upon the skin.

In no other way than a study of the finger prints is it possible to find over a thousand points of comparison upon which to establish the identity of an individual. In estimating the value of finger prints as evidence of identity, Sir Francis Galton found that out of 1000 thumb prints the collection could be classified into 100 groups, each containing prints with a more or less close resemblance to one another. . . . On studying the minutiae of the patterns, and calculating the chances that the print of a single finger should agree in all particulars with the print of another finger, he concluded that it was as one is to about sixty-four millions; so that the chance of two persons giving similar prints from a single finger would

PLATE A

be less than one in four. If the comparisons were extended to two fingers, the improbability of agreement in all details would be squared, "reaching a figure altogether beyond the range of imagination." The general conclusion drawn from these numerical results was that even after making all allowance for ambiguities and for possible alterations caused by accident or disease, a complete, or nearly complete, agreement between two prints of one finger and infinitely more so between two or more fingers, afforded evidence, which did not stand in need of corroboration, that the prints were derived from the fingers of one and the same person. In finger prints, therefore, we have the only means of proving the identity of an individual beyond all question. . . .

The first attempt to classify the various patterns formed by the ridges was that of Purkenje, a doctor of medicine, who, in 1823, delivered a thesis upon the subject at the University of Breslau. He concluded that all the varieties of curves might be grouped under nine main heads or standard types, which he described as follows: (1) Transverse curves. (2) Central longitudinal stria. (3) Oblique stria. (4) Oblique sinus. (5) Almond. (6) Spiral. (7) Ellipse or elliptical whorl. (8) Circle or circular whorl; and (9) Double whorl. The differences between these different types are best shown by diagrams, and the accompanying figure,¹ reproduced by permission of Sir Francis Galton, represents the cores of the nine standard patterns. This classification, resting as it does upon merely superficial appearances, does not afford a certain means of separating the types, since factors, such as the depth of printing, the size of the patterns, and the prominence of secondary details may have an undue influence in the placing of a particular print in one or the other group.

After numerous futile attempts to make use of Purkenje's system, Sir Francis Galton discarded it in favor of a system in which the triangular space or spaces found in the majority of finger impressions was made the basis of classification. Starting upon the two divergent ridges from these spaces an outline was then drawn as far as it could be traced, the course of each ridge being followed with minute fidelity. In this way a series of sharply-defined outline figures were obtained. The various patterns may, as a rule, be classified into the three main groups of arches, loops, and whorls, while some of the transitional forms may be grouped under more than one of these heads. Other patterns, again, which are of rare occurrence, are not suitable for inclusion in any of the three groups. A system of indexing based upon this method of classification was also devised in which letters represented the varieties of patterns. Thus *a*, *a*, *a* indicate that the outline upon the fore, middle, and ring fingers consists of arches, while *a*, *w*, *l* indicate an arch upon the forefinger, a whorl upon the middle finger, and a loop upon the ring finger. The letters *i* and *o* are also used, the former indicating a loop with an inward slope and the latter one with an outer slope upon the forefinger. The possible variations in such a classification of the impressions of the three fingers of the right hand cannot exceed thirty-six, and a thousand prints may therefore be indexed into one of these thirty-six groups. Subdivisions of these main groups may then be based upon the characteristics of the prints of the fingers of the other hand and of the thumbs, while differences in the cores of the patterns afford a means of forming smaller divisions of the loop patterns.

From observations of the 5000 prints of 500 individuals, Sir Francis

¹ [See plate A, reproduced by consent of the publishers, Macmillan & Co., Ltd. — Ed.]

Galton found that arches were present in 6.5 per cent; loops in 67.5 per cent; and whorls in 26.0 per cent. Each digit and hand, however, had its own peculiarities, and the variations in the percentage of arches upon different digits ranged from 1 to 17; that of the loops from 53 to 90; and that of the whorls from 13 to 45. Loops occurred with most frequency upon the little finger and then upon the middle finger, while whorls were rarely met with upon these fingers, but were of common occurrence upon the thumb and ring finger. The classification employed by the English police was devised by Sir Edward Henry and is a modification of that of Sir Francis Galton, from which it differs in making use of four types instead of three. The impressions are grouped into arches, loops, whorls, and composites. The last group includes patterns made up of combinations of the other three, or those which might be classified either as loops or whorls. There are also numerous subdivisions of the group into patterns with characteristics in common, such as "central pockets" and "accidentals," and further differentiation is effected by counting the number of ridges between two fixed points in the patterns. Examples of these four groups are shown in the plate facing p. 82.¹ . . .

² Finally, the Argentine Vucetich has simplified the system so successfully that his method has spread everywhere. Vucetich distinguishes only the following four main types: *a.* Arch (A, or 1). *b.* Internal loop (I, or 2). *c.* External loop (E, or 3). *d.* Vertical (V, or 4). An impression of the five fingers of each hand is made upon the card; then, in view of the dactylogram obtained, one can establish the dactylographic formula of the subject, representing the

type to which each finger corresponds by preëstablished figures. The thumb is excluded and is designated always by the letter of the type to which it belongs. Take, for instance: V 3242, I 3343. This formula represents a subject with the following papillary structures:

| | | |
|------------|---|------------------------------------|
| Right Hand | { | Thumb — Vertical (V). |
| | | Forefinger — External loop (3). |
| | | Middle finger — Internal loop (2). |
| | | Ring-finger — Vertical (4). |
| | | Little finger — Internal loop (2). |
| Left Hand | { | Thumb — Internal loop (1). |
| | | Forefinger — External loop (3). |
| | | Middle finger — External loop (3). |
| | | Ring-finger — Vertical (4). |
| | | Little finger — External loop (3). |

The combined ten alphabetical or numerical designations yield a large number of formulæ which allow and facilitate the classification of the cards.

But how can we compare two different prints of the same type and obtain the identification? Stockis sums up the various methods in his *Investigation and Identification of Finger Prints*. According to him, Windt enumerates the papillary lines from the delta to the bifurcations, the ends of the lines, and the points or lines fastened among the others. Galton and Henry, tracing a line, join the center of the print with the delta and count the lines thus crossed, the points touching one another, etc. Sarachaga bases his comparison of the distinct types of the vertical on the number of lines, the elevation of the loop, the inclination (horizontal, oblique, vertical), and the direction

TYPES OF FINGER PRINTS

PLATE B

(rectilinear or curvilinear) of the axis of the drawing, the opening of the central angle of the print, and, finally, on the apparent scars. Roscher and Gasti emphasize the number of the lines and the configuration of the crests composing the delta. Vucetich compares, above all, the directive lines and the characteristic points (bifurcations, pitchforks, islands, etc.). Daae also investigates the characteristic points. Giribaldi distinguishes the varieties of verticals, the scars that can possibly cross the print, and the details of the lines. Pottecher bases his observation mainly on the enumeration of the lines. Niceforo recommends the investigation of the directive lines, the number of the furrows, the characteristic points (starting point of the lines, bifurcations, rings, points), and the casual or anomalous peculiarities (scars,

pustules, syndactylæ, etc.). Finally, Reiss calls attention to the photographic method of the superposition of the two enlarged pictures, the first on paper and the second on a transparent film, or by passing simultaneously in the projecting lantern two photographic plates of the two prints natural size, one on glass and the other on stiff film. In either case the identification is obtained from the matching of the lines. It is impossible to discuss the advantages and the inconveniences of all these methods. Their multiplicity offers a serious obstacle for international investigations. Yet, the advantages offered by Vucetich's system are such as to win him popularity in both hemispheres. A place seems to be reserved for his system in the international dactyloscopic catalogue which some are planning.

26. PEOPLE v. JENNINGS. ' (1911. SUPREME COURT OF ILLINOIS. 252 Ill. 534, 96 N.E. 1077.)

Error to Criminal Court, Cook County; MARCUS KAVANAGH, Judge. Thomas Jennings was convicted of murder, and he brings error. Affirmed. *William G. Anderson* and *F. L. Barnett*, for plaintiff in error. *W. H. Stead*, Atty.-Gen., and *John E. W. Wayman*, State's Atty. (*John E. Northrup*, of counsel), for the People.

CARTER, C. J. Plaintiff in error, Thomas Jennings, was found guilty in the criminal court of Cook county of the murder of Clarence B. Hiller, the jury fixing the penalty at death and judgment being entered on the verdict February 1, 1911. This writ of error is sued out to review the record in that case. . . .

At the time of the murder, September 19, 1910, Clarence B. Hiller, with his wife and four children, lived in a two-story frame house facing north on West 104th street, just east of Waldon parkway in Chicago. Immediately west of Waldon parkway, which runs north

and south, and separated from the street by a wire fence, are the suburban tracks of the Chicago, Rock Island & Pacific Railway Company. East of the Hiller house was a vacant lot, and east of that was the residence of a family named Pickens. South of the Hiller house was a vacant space, beyond which were two houses facing west on Waldon parkway, the southern one being occupied by the McNabb family. The north or front door of the Hiller house leads into a hallway on the east side of the house and from the south end or rear of this hallway a stairway leads up to the second floor. The south bedroom nearest the head of the stairs was occupied by the daughter Florence, 13 years of age. Then came the bedroom of the daughter Clarice, 15 years of age, and at the north or front end of the second floor was a bedroom occupied by Mr. and Mrs. Hiller and the two younger children. At the head of the stairs, near the door

leading to Florence's room, a gas light was kept burning at night. Shortly after 2 o'clock on Monday morning of September 19, 1910, Mrs. Hiller was awakened and noticed that this light was out. She called her husband's attention to the fact and he went in his night clothes to the head of the stairway, where he encountered an intruder, with whom he grappled, and in the struggle both fell to the foot of the stairway, where Hiller was shot twice, dying in a few moments. Just a little before the shooting the daughter Clarice had seen the form of a man at her doorway, holding a lighted match by his body, but not so as to show his face. As it was the practice of her father to get up and see if the children were all right in the night, she was not frightened. The form disappeared from her doorway, and she heard footsteps shuffling toward the room of her sister Florence, after which she heard a little sound made by Florence. She next heard her father going through the hallway. Then came the struggle and the shooting. . . . The Pickens family were awakened by the screams of Mrs. Hiller and her children, and the father, John C. Pickens, partially dressed and ran to the Hiller house. He reached there at about the same time as his son, Oliver Pickens, and Officer Beardsley. The son had been visiting friends on the north side in Chicago and had left the train at the suburban station, about a block away, and was walking towards home when he heard the screams from the Hiller house and ran there, meeting a police officer, Floyd Beardsley, who had also heard the screams, and was searching for the cause. They were let in by the daughter Clarice, and found the body of Mr. Hiller lying near the bottom of the stairway, his nightgown saturated with blood. The shooting occurred about 2.25 A.M. The witnesses who reached the house shortly after found three

revolver cartridges undischarged and two leaden slugs. Neither of the shots fired had lodged in the body of the deceased, one entering the upper part of the left arm and passing out through the shoulder and neck, and the other entering the right breast and passing out through the lung and heart. Shortly thereafter Mrs. Pickens, going upstairs to get a cover for the body, found particles of sand and gravel on Florence's bed near the foot.

About three quarters of a mile east of the Hiller house is Vincennes road, running southerly, with a slight inclination to the west, and which is occupied by a street car line. This street is intersected at 103d street by the tracks of the Panhandle railroad, which run southerly, with a slight inclination to the east. The street car line connects with the Chicago City Railway system at Seventy-ninth street, and extends in a southerly direction from 103d street through Blue Island to Harvey, about 8½ miles south of 103d street. On the west of Vincennes road, at 103d street, is a crossing gate. Early in the morning on which the murder occurred, four police officers, who shortly before had gone off duty in that neighborhood, were sitting on a bench just north of the gate, waiting for a north-bound street car. The gate was up, so that the officers were not easily seen by one approaching from the south. About 2.38 A.M., Jennings approached the place from the south. The officers spoke to him, and he continued walking for a few steps with his right hand in his trousers pocket, holding a loaded revolver. They searched him and took the weapon away. They did not know at this time of the murder. Jennings was perspiring, and the officers testified that fresh blood appeared at different places on his clothing. About three inches above his left wrist they found a slight wound, fresh and bleeding slightly. Jennings told

the policemen that the blood came from a wound on his left little finger, received from falling off the street car at Seventy-ninth street the evening before, when he was on his way to Harvey. Dr. Clement, who examined Jennings about half past 3 that morning at the police station, found the wound on the little finger scabbed over and not of recent origin. He also found the wound on the left arm fresh and bleeding, clean cut, with recent blood coming from it, not coagulated. The doctor testified that it looked like a bullet wound and not like an injury received from falling off a street car. Dr. Springer also examined Jennings, and his testimony, so far as it covered the same ground, was practically to the same effect. It was testified that the holes in the sleeves of the shirts, which were introduced in evidence as exhibits, were continuous with this fresh cut in the arm. The officers took Jennings to the station on the street cars, and when examined there, sand was found in his shoes. Jennings, when arrested, first told the officers that he lived at 1244 State street, Chicago, and later 577 Twelfth street; that he left for Harvey about 7 or 8 o'clock the evening before to visit friends, and that when he started to return from Harvey, about 12 o'clock, not finding a street car, he had walked back to that point.

In August, 1910, Jennings had been released on parole from the penitentiary at Joliet, where he had been sentenced on a charge of burglary. He had been paroled before, but had been returned for a violation of the parole. Two weeks after his second parole, on August 16, 1910, he purchased a new 38 caliber revolver, giving his name as Will Jones, of Peoria. On September 9th following he had pawned this revolver for \$2 under the name of Will Jackson, getting it back September 16th. On the 18th he pawned it to Elroy Jones, a saloon-

keeper, getting it back about 7 P.M. on the night of September 18, 1910. It was this revolver that the officers found on Jennings' person when he was arrested. It was loaded with five cartridges, which were marked, "A. P. C. 38 Smith & Wesson." The testimony showed that these cartridges were identical in appearance, size, and markings with the three undischarged cartridges found in the hallway of the Hiller house near the dead body. Jennings testified that he had not fired the revolver since he owned it and knew of no one else firing it. The officers testified that in their judgment it had been fired twice within an hour before his arrest, arriving at this conclusion from the smell of fresh smoke and the burned powder in two chambers of the cylinder. Later, chemical tests and the evidence of a gunsmith corroborated this testimony that the chambers contained burned particles of powder.

Over the objection of the plaintiff in error evidence was admitted to the effect that about 2 A.M., September 19, 1910, just before the shooting of Hiller, some one entered the McNabb house. Mrs. McNabb was awakened and saw a man standing in the door with a lighted match over his head. The man was tall, broad shouldered, and very dark. . . . Jessie McNabb, a daughter, who occupied the same bed with her mother, was awakened and saw the intruder. She testified he wore a light-colored shirt and figured suspenders; that he was large, with broad shoulders. From the shirt and suspenders which were introduced in evidence, and from the build of Jennings, she was of the opinion he was the man that was in their room. Mrs. McNabb also testified that she thought the man in the room was Jennings, from his size and build and from what she saw of him. Jennings was 6 feet tall and weighed about 175 pounds. . . .

While Jennings told several wit-

September 18th to go to Harvey about 7 o'clock, he testified on the trial, and one or two other witnesses also testified, that he did not leave the downtown part of the city until after 10 o'clock on Sunday evening, September 18th. He stated once or twice after his arrest that he went to Harvey to visit acquaintances named Robinson, and gave the officers to understand that after visiting with them he missed the street car and walked back. The state proved by the Robinsons that he did not call on them on the night in question, and later Jennings testified in his own behalf that he knocked at the Robinsons' door and no one responded, so he went to a place called Phoenix, a short distance from Harvey, where he visited a saloon. No other witness corroborated him as to his presence in Harvey, Phoenix, or at any other point south of the Halsted residence on the night in question. He denied being at the Halsted house, the McNabb house, or the Hiller house, or having anything to do with the shooting. When arrested he denied that he had ever been arrested before, giving his name as Will Jones.

Mrs. Hiller testified that their house had but recently been painted, the back porch, which was the last part done, being completed on the Saturday preceding the shooting. Entrance to the house had been gained by the murderer through a rear window of the kitchen, from which he had first removed the window screen. Near the window was a porch, on the railing of which a person entering the window could support himself. On the railing in the fresh paint was the imprint of four fingers of some one's left hand. This railing was removed in the early morning after the murder by officers from the Chicago police force and enlarged photographs were made

violation of his parole, in March, 1910, had a print of his fingers taken and another print was taken after this arrest. These impressions were likewise enlarged for the purpose of comparison with the enlarged photographs of the prints on the railing. Four witnesses, over the objection and exception of counsel, testified that in their opinion the prints on the railing and the prints taken from Jennings' fingers by the identification bureau were made by the same person. . . .

It is contended that the evidence as to the comparison of photographs of the finger marks on the railing with the enlarged finger prints of plaintiff in error was improperly admitted. While the courts of this country do not appear to have had occasion to pass on the question, standard authorities on scientific subjects discuss the use of finger prints as a system of identification, concluding that experience has shown it to be reliable. 10 Ency. Britannica (11th Ed.), 376; 5 Nelson's Ency. 28. See, also, Gross' Crim. Investigation (Adams' Transl.), 277; Fuld's Police Administration, 342; Osborn's Questioned Documents, 479. These authorities state that this system of identification is of very ancient origin, having been used in Egypt when the impression of the monarch's thumb was used as his sign manual, that it has been used in the courts of India for many years and more recently in the courts of several European countries; that in recent years its use has become very general by the police departments of the large cities of this country and Europe; that the great success of the system in England, where it has been used since 1891 in thousands of cases without error, caused the sending of an investigating commission from the United States, on whose favorable report a bureau was established by

the United States government in the war and other departments.

Four witnesses testified for the state as to the finger prints. William M. Evans stated that he began the study of the subject in 1904; that he had been connected with the bureau of identification of the Chicago police department in work of this character for about a year; that he had personally studied between 4000 and 5000 finger prints and had himself made about 2000; that the bureau of identification had some 25,000 different impressions classified; that he had examined the exhibits in question, and on the forefinger he found 14 points of identity, and on the second finger 11 points; that in his judgment the finger prints on the railing were made by the same person as those taken from the plaintiff in error's fingers by the identification bureau.

Edward Foster testified that he was inspector of dominion police at Ottawa, Canada, connected with the bureau of identification; that he had a good deal to do with finger prints for six years or more; that he had special work along that line in Vancouver and elsewhere in Canada; that he had studied the subject at Scotland Yard; that he began the study in St. Louis in 1904 under a Scotland Yard man and had taken about 2500 finger prints; that he had studied the exhibits in question and found 14 points of resemblance on the forefinger; that the two sets of prints were made by the fingers of the same person.

Mary E. Holland testified that she resided in Chicago; that she began investigation of finger-print impressions in 1904, studied at Scotland Yard in 1908, passed an examination on the subject, and started the first bureau of identification in this country for the United States government at Washington; that they have over 100,000 prints at Scotland Yard; that she also had studied the two sets of prints and believed them to have been

made by the fingers of the same person.

Michael P. Evans testified that he had been in the bureau of identification of the Chicago police department for 27 years; that the bureau had been using the system of finger-print impressions since January 1, 1905, and that they also used the Bertillon system; that he had studied the question since 1905 or 1906 and had made between 6000 and 7000 finger prints; that he had charge of the making of the photographs of the prints on the railing; that in his judgment the various impressions were made by the fingers of the same person.

All of these witnesses testified at more or less length as to the basis of the system and the various markings found on the human hand, stating that they were classified from the various forms of markings, including those known as "arches," "loops," "whorls," and "deltas."

It was further insisted on oral argument and in the briefs of the plaintiff in error that the evidence is not sufficient to support the verdict.

We deem it not improper to say that all the incriminating proof points to the accused. There is absolutely nothing in the record tending to show that the crime was committed by any one else. Among the many circumstances which must have convinced the court and jury that the plaintiff in error was the criminal agent were his statements, so inconsistent with the testimony of many other witnesses, in explaining his whereabouts on the night in question; also his statements as to how the blood came to be on his clothing, how he received the wound on his arm, and the tearing of his coat pocket. Then, too, they must have considered his lack of motive in going to Harvey and almost immediately turning around and coming back; the improbability, when he had sufficient money to pay his car fare, that he should walk that

distance at that time of the night when the cars were running each hour and one left within an hour after he claims he started; the condition of his clothing when arrested; the sand in his shoes and on the young girl's bed; the evidence that his revolver had recently been discharged; the testimony of three witnesses that he was seen in the neighborhood of the crime just before its commission; the fact that

the bullets which had inflicted the mortal wounds were of the same size and kind as those in his revolver. No one of these circumstances, considered alone, would be conclusive of his guilt, but when all the facts and circumstances introduced in evidence are considered together, the jury were justified in believing that a verdict of guilty should follow as a logical sequence.

.

TITLE III: EVIDENCE TO PROVE A HUMAN TRAIT, QUALITY, OR CONDITION

27. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹

The reasons for dividing into four groups the whole subject of Circumstantial Evidence have been already stated (*ante*, No. 3). The groups being distinguished according to the probanda to be proved, the third group is now to be considered, namely, Evidence to prove a Human Quality, Condition, or other attribute. This group of Probanda separates itself from the fourth (Human Acts) with fair distinctness, because the circumstances available as evidence are usually distinct for the two groups. Though the distinction between the two groups is only a rough and practical one, nevertheless, it is in essence a real and unavoidable one, and by no means artificial.

The chief kinds of human qualities or conditions to be proved may be reduced to the following sorts: Moral Character or Disposition; Physical and Mental Capacity; Design or Plan, and Intent; Knowledge, Belief, or Consciousness; Motive or Emotion; Habit or Custom.

It will be understood that we are here *not concerned how the above human qualities come to be probanda*. We are concerned only to learn what facts will be evidential to prove the quality proposed for proof. For instance, character may be in issue through the pleadings in a suit for slander on a plea of justification, or in an action for personal injury as an element of the defendant's liability for an incompetent servant; or it may be used, not as in issue through the pleadings, but as evidential to prove a human act, for example, the good character of a defendant in a criminal case or his bad character in rebuttal. So, also, knowledge may be in issue in a suit to set aside a purchase in fraud of creditors, or it may be evidential only, as when it is offered to prove the doing of a past act as a mark of identity. In all these instances the quality which is termed character, knowledge, or the like, has somehow come into the case as a proposition to be proved; and the question how to evidence it presents itself equally whether the probandum, when once proved, is going in turn to be used itself evidentially to show some other fact, or is one of the very ultimate propositions made material by the pleadings.

Three species of evidential facts are available to show a human quality or condition: (1) *Conduct*; this is the expression, in outward behavior or acts, of the quality or condition operating to produce effects. These results are the traces by which we may infer the moving cause. In point of time, conduct is closely associated with the internal condition giving rise to it; nevertheless, the indication is strictly not a concomitant, but a retrospectant one (*ante*, No. 3), because the argument is backwards in time from effect (conduct) to cause (internal condition). (2) *External facts* pointing for-

¹ Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, § 190.)

ward to the probable coming into existence of the quality; for example, the victim's gold, as pointing forward to the defendant's probable desire to rob him, or the reputation of A's insolvency, as pointing forward to B's probable receipt of knowledge of it. In using this evidence, we take our stand beforehand and argue that the evidential fact probably gave rise to the emotion, knowledge, or intent to be proved. The indication is thus prospectant; while that of conduct is retrospectant. (3) There is also a third sort of fact, having either a prospectant or a retrospectant indication, and not exactly corresponding to either of the preceding sorts, namely, *prior or subsequent condition*, as showing condition at a given time.

Thus, to prove insanity, we may offer (1) conduct as the effect illustrating its cause, mental aberration, (2) circumstances of unsuccessful business, domestic troubles, and the like, tending to bring on insanity; and (3) prior or subsequent insanity, pointing forwards or backwards to insanity at the time in question. So also, to show a husband's desire or motive to get rid of his wife, we may offer (1) his conduct exhibiting such a desire, (2) the existence of a paramour, tending to create such a desire, and (3) a prior desire, as pointing forward to its continued existence at the time in question.

TITLE III (continued): EVIDENCE TO PROVE A HUMAN TRAIT, QUALITY, OR CONDITION

SUBTITLE A: EVIDENCE TO PROVE MORAL CHARACTER

28. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹

Inasmuch as heredity and environment are not yet defined enough, in their known influences, to be available as evidence, there is for the *prospectant* class of evidence practically nothing to be considered under this head.

Under the *retrospectant* class, on the other hand, there is an abundance, namely, the conduct of the person, exhibiting his moral traits. But for present purposes it will be sufficient to note several distinctions, which in practice limit the scope of the subject.

At the outset of this entire class of inferences, it must be noted that, where the doing of an act is the ultimate proposition to be proved, there can never be a direct inference from an act of former conduct to the act charged; there must always be a double step of inference of some sort, a "tertium quid." In other words, it cannot be argued: "Because A did an act X last year, therefore he probably did the act X as now charged." Human action being infinitely varied, there is no adequate probative connection between the two. A may do the act once, and may never do it again; and not only may he not do it again, but it is in no degree probable that he will do it again. The conceivable contingencies that may intervene are too numerous.

Thus, whenever resort is had to a person's past conduct or acts as the basis of inference to a subsequent act, it must always be done *intermediately through another inference*. It may be argued: "A once committed a robbery; (1) therefore he probably has a thieving disposition; (2) therefore he probably committed this robbery"; or "(1) therefore he had some general design to commit certain robberies; (2) therefore he probably carried out that design and committed this robbery." Or it may be argued: "A gave money to his poor friend B; (1) therefore A probably is of a benevolent disposition; (2) therefore A probably did not commit the present robbery"; or "(1) therefore he probably had a kindly feeling towards B; (2) therefore he probably did not rob B." The impulse to argue from A's former bad deed or good deed directly to his doing or not doing of the bad deed charged is perhaps a natural one; but it will always be found, upon analysis of the process of reasoning, that there is involved in it a hidden intermediary step of some sort, resting on a second inference of character, motive, plan, or the like. This intermediate step is always implicit, and must be brought out.

¹ Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, § 192.)

To make available such evidence of past conduct or acts, some use for it must be found as evidencing character, design, or other quality.

Moral Character of an Accused. — That specific acts of misconduct have probative value in leading to a belief as to the existence of a moral trait of more or less constant nature is undoubted:

State v. Lapage. (1876. 57 N. H. 275, 299). On a charge of murder committed in an attempt to rape, the fact of the defendant's recent rape of another person was offered; Mr. Norris, arguing for the defense: "Making no point of remoteness in time or space, let us see how well this evidence will bear analyzing. Premise to be proved: he committed a rape, in no way, except in kind, connected with this crime. Inference: a general disposition to commit this kind of offense. Next premise: this general disposition in him. Inference: he committed this particular offense. . . . It may be tried by the common test of the validity of arguments. Some men who commit a single crime have, or thereby acquire, a tendency to commit the same kind of crimes; if this man committed the rape, he might therefore have or thereby acquire a tendency to commit other rapes; if he had or so acquired such a tendency, and if another rape was committed within his reach, he might therefore be more likely to be guilty: if more likely to be guilty of rape, and if there was a murder committed in perpetrating or attempting to perpetrate rape, he might therefore be more likely to be guilty of this rape, and hence of this murder; a sort of an 'ex-parte' conviction of a single rape, from which the jury are to find a general disposition to that kind of crimes, in order to help them out in presuming the commission of another rape as a motive or occasion of the murder. We can find nothing like it in the books." LADD, J.: "It is argued on behalf of the State (if I have not wholly misapprehended the drift of the argument) that the evidence was admitted because, as matter of fact, its natural tendency was to produce conviction in the mind that the prisoner committed rape upon his victim at the time he took her life. . . . I shall not undertake to deny this. If I know a man has broken into my house and stolen my goods, I am for that reason more ready to believe him guilty of breaking into my neighbor's house and committing the same crime there. We do not trust our property with a notorious thief. We cannot help suspecting a man of evil life and infamous character sooner than one who is known to be free from every taint of dishonesty or crime. We naturally recoil with fear and loathing from a known murderer, and watch his conduct as we would the motions of a beast of prey. When the community is startled by the commission of some great crime, our first search for the perpetrator is naturally directed, not among those who have hitherto lived blameless lives, but among those whose conduct has been such as to create the belief that they have the depravity of heart to do the deed. This is human nature — the teaching of human experience. If it were the law, that everything which has a natural tendency to lead the mind towards a conclusion that a person charged with crime is guilty must be admitted in evidence against him on the trial of that charge, the argument for the State would doubtless be hard to answer. If I know a man has once been false, I cannot after that believe in his truth as I did before. If I know he has committed the crime of perjury once, I more readily believe he will commit the same awful crime again, and I cannot accord the same trust and confidence to his statements under oath that I otherwise should. . . . Suppose the general character of one charged with crime is infamous and degraded to the last degree; that his life has been nothing but a succession of crimes of the most atrocious and revolting sort: does not the knowledge of all this inevitably carry the mind in the direction of a conclusion that he has added the particular crime for which he is being tried to the list of those that have gone before? Why, then, should not the prosecutor be permitted to show facts which tend so naturally to produce a conviction of his guilt?"

Inasmuch, however, as the settled rule of law of Admissibility prohibits the use of this class of evidence for an *accused's* character, there is at present no

utility in seeking for its principles of proof; nor is there adequate material for studying them. At some future stage of the law, such principles may be developed. In its present stage we are confined to using the moral trait itself (*post*, No. 84). This we usually arrive at by reputation. To the extent that the accused's former specific misdeeds become disclosed at the trial, our inference nominally is still from his supposed trait; though actually it may be a hazy double inference from conduct to trait and from trait to act in issue.

Moral Character of Other Persons. The above-named exclusionary rule of law applies to an accused's character only. What of other persons' moral character? In two not uncommon classes of cases, the moral trait may be evidentially relevant to the *doing of an act*, and not prohibited by any artificial rule,—the woman-complainant in rape, and the civil party charged with negligence. Here the probative force would naturally be dependent somewhat on the circumstances of each former act, the number of them, and the similarity of them to the trait involved in the case in hand. But as mere Admissibility has almost invariably been the subject of the judicial rulings, practically no material exists for studying the probative value of such evidence.

The same is true of conduct evidence when the moral trait is *in issue* under the pleadings. Hence, no further consideration of the subject is here feasible.

TITLE III (continued): EVIDENCE TO PROVE A HUMAN TRAIT, QUALITY, OR CONDITION

SUBTITLE B: EVIDENCE TO PROVE MOTIVE

29. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹ *Motive*.

The term "motive" is commonly used in a confusing way, as if there were but one thing and one evidential question involved. But there are two things, and two distinct evidential steps. (1) We may argue, first, that since a specific emotion or passion is likely to lead to the doing of the appropriate act — for example, desire for money to theft or robbery, or angry hostility to an act of violence — the presence of such an emotion in the person in question is likely to lead to the deed in question. In this step of the argument we assume the emotion as a fact, proved somehow or other. Just as a specific sort of disposition, of habit, of plan, is likely to lead to the appropriate act, so a specific sort of emotion or passion has a similar evidential bearing. The basis of this inference is the living, impelling, active emotion, seeking for an outlet in volition. (2) But this emotion must in its turn be proved, — just as character, design, capacity, must be proved. This is the next step, and evidential by a very different one. Usually the evidence is circumstantial; and of two sorts, (a) conduct of the person, and (b) events about him tending to excite the emotion. In (a) his conduct is the expression and effect of the existing internal emotion. In (b) the outward facts are such as may be the stimulus and cause of the emotion. But whether a person's conduct or outer events have shown the existence of the emotion is a different question from the question whether a proved emotion did actually culminate in an act induced by it.

The unfortunate ambiguity in the word "motive" thus reveals itself. That which has value to show the doing or not doing of the act is the inward emotion, passion, feeling, of the appropriate sort; but that which shows the probable existence of this emotion is termed — when it is of the sort (b) above, *i.e.* some outer fact — the "motive." For example, the prosecution of A by B in a suit at law may be said to have been a "motive" for A's subsequent burning of B's house. But in strictness the external fact of B's suit cannot be A's "motive"; for the motive is a state of mind of A; the external fact does tend to show the excitement of the hostile and vindictive emotion, but it is not identical with that emotion. This use of the word "motive" thus tends to obscure the double evidential step involved; for when it is said that B's suit may be offered in evidence as the "motive" for A's burning, we are apt to conceive ourselves as inferring directly from the suit (as the evidentiary fact) to the burning (as the proposition to be proved); when in truth there are two steps involved, — from

¹ Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, § 117.)

the lawsuit to the emotion, and the emotion to the act. It ought, therefore, to be clearly understood that the "motive," in the correct sense, is the emotion supposed to have led to the act, and that the external fact is merely the possible exciting cause of this "motive," and not identical with the "motive" itself.

The opportunities for erroneous inference being therefore of a double nature, the illustrative cases can therefore not well be separated; the skill to distinguish the precise point of weakness of the inference can best be cultivated by studying them together. Accordingly they are all placed *post*, Title IV, Doing of a Human Act, Subtitle B, Prospectant Circumstances, Topic 2, Motive (Nos. 101-115).

TITLE III (continued): EVIDENCE TO PROVE A HUMAN TRAIT, QUALITY, OR CONDITION

SUBTITLE C: EVIDENCE TO PROVE KNOWLEDGE, BELIEF, OR CONSCIOUSNESS

30. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹

General Analysis of the Subject. The notions of Knowledge, Belief, and Consciousness are not precisely identical; but they have a common feature, which is the typical one so far as concerns the modes of evidencing these mental states. That feature is most nearly expressed by the term Consciousness, *i.e.* presence in the mind of an impression as to a given fact. Thus, a person's Knowledge of a city's streets may be inferred from his conduct in finding his way through them unerringly; his Consciousness of guilt may be inferred from his conduct in fleeing from arrest; his Belief in a friend's innocence of embezzlement may be inferred from his conduct in trusting him with money. The term Belief is used commonly when the impression is thought of as bearing on a past, present, or future external fact, Consciousness when thought of as bearing on past action, and Knowledge when thought of in connection with a present or past external fact. We are here not concerned, in theory at least, with the way in which one of these states of mind has come to be an object of proof, either as being in issue or as being itself evidential of something else. It is assumed that somehow this kind of state of mind — impression, consciousness, knowledge, belief — is in the case, either as material to the issue or as relevant to prove something; and the question is how it is in its turn to be evidenced.

Of the three modes of evidencing a state of mind (*ante*), the first two are here the commonest. (A) External circumstances, calculated by their presence or occurrence to bring about the state of mind in question, are also available to show the probability that consciousness, knowledge, or belief subsequently ensued. (B) Conduct or behavior (including language not used assertively) illustrates and points back to the state of mind producing it. (C) A prior or subsequent state of mind indicates, within certain limits, its existence at the time in question.

(A) *External Circumstances, as evidencing Knowledge, Belief, or Consciousness.* There are, in a broad analysis, four kinds of circumstances (events or things) which may point forward to the probability that a given person received a given impression (*i.e.* obtained knowledge, formed a belief, or was made conscious): (1) The *direct exposure* of the fact to his sense of sight, hearing, or the like; (2) The *express* making of a *communication* to him; (3) The *reputation* in the community on the subject, as leading probably to an express communication; (4) The *quality of the occurrence*, as leading either to actual perception by his senses, or to express

¹ Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, §§ 244, 265.)

communication. Throughout all these four modes there run two considerations, affecting some modes more strongly than others: (a) The probability that the person received an impression of any fact at all; and (b) The probability that from the particular occurrence he would gain an impression as to the specific fact in question. Doubt may arise upon either of these points, and the various modes above are stronger or weaker in one or the other of these considerations. The four modes may now be examined more in detail.

(1) *Direct exposure of the fact to the senses.* Here there is seldom any doubt as to the element (b) above; the question usually is whether the fact in question was brought within the range of the senses so as probably to be perceived at all. The typical case is the possession of a document. If a deed or a notice was laid on A's desk, the probability (greater or less according to circumstances) is that A read it. But actual possession by A is not necessary; the posting of a placard in a street through which A habitually passes is some evidence that A ultimately came to see and understand its contents. Occasionally the element (b) above is the emphatic one; for example, where A is charged with selling liquor to B, a minor, the appearance of B, as indicating A's knowledge of B's minority or his belief in B's maturity, was the fact brought before A, and the question is whether it would probably have informed him as to the further specific fact, namely, B's age.

(2) *Express communication.* Little difficulty can arise here. There may be a question as to whether the communication came from a source which the person was fairly bound to consider authentic; but this would be a question of substantive law, involving the elements of good faith, constructive notice, or the like.

(3) *Reputation.* Here the element (a) is the important one. The probative considerations are that, when a matter is so much talked of in a community that a reputation arises about it, a member of that community, in his ordinary intercourse with others, will come to hear it mentioned, *i.e.* by express communication; and the question is whether the probability is that there would be such a general discussion and whether the person is likely to have learned of that discussion.

(4) *Quality of the occurrence,* in general. Sundry cases here combine the considerations of all the preceding modes, as well as of both the elements (a) and (b) above. Thus, a former accident to apparatus owned by A may indicate that A learned of the defect in the apparatus, either because he probably observed the former accident or because he probably was told of it by his subordinate having charge of the apparatus, or because complaint was probably made to him; and not only is the probability (a) of his having learned of the former accident thus involved, but also the probability (b) that the former accident would have revealed to him specifically the existence of the defect. So, also, a former act of violence by the deceased, in order to have any value to show the slayer's ground for apprehension of an attack, must (a) not only have been communicated to the slayer, (b) but also must be such as would create a belief in the deceased's probable aggression.

Such being the various modes in which the evidence may operate, nevertheless in a given situation (as where an employer is to be charged with

knowledge of an employee's incompetency, or a defendant accused of murder is to show belief in the deceased's probable aggression) the knowledge, belief, or consciousness may be sought to be evidenced by more than one of the above modes.

(B) *Conduct, as Evidence of Knowledge, Belief, or Consciousness.* In this sort of evidence, we argue from an observed effect — conduct — to the probable cause — a specific mental state; and not, as in the preceding sort, from cause to effect, *i.e.* from outward events to an ensuing mental state. Conduct and word utterances may betray the knowledge or belief of the actor or speaker, in so far as the specific act or utterance is of a tenor which cannot well be supposed to have been willed without the inner existence of that knowledge or belief. For example, A's act of boarding a railroad train is some evidence of his belief as to the destination of the train; B's act of taking a purse, found by him in the street, to the house of X, is some evidence that he knows or believes X to be the loser of the purse. So, also, for the verbal utterance; A's mention of Charles the Great or Roentgen rays or the Klondike is some evidence that he knows or is aware of the existence of such a person, thing, or place. Ordinary experience usually suffices, without controversy, to tell us whether the inference is a strong one.

§ 267. *Same: Conduct as Evidence of Belief, and thus of the Fact Believed.* In the foregoing cases the knowledge or belief — *i.e.* the mental condition — to be evidenced was of itself material to the issue as a *factum probandum*, — *e.g.* whether an insured knew of his illness, or whether the public were made to believe in a certain defamatory meaning. There is, however, a large class of cases where the belief or knowledge or consciousness is of service only evidentially, as forming a second step of inference to some other fact which forms the ultimate object of the trial, — usually an act done by the person. For example, on an issue of the existence of a lost will, suppose the fact to be offered that the deceased on his death bed told his daughter, "My will was made in town yesterday"; or, on an issue of legitimacy, suppose the fact to be offered that the parents always treated the child as their own. In these instances suppose it to be argued that the deceased's utterance indicates circumstantially his belief in the will's execution, and that his belief in turn indicates the fact of the will's execution; or that the parents' conduct leads to the inference that they believed the child to have been born to them after marriage, and that this belief evidences the fact of such birth. Such a double circumstantial inference is in theory perfectly possible and proper. But in practice it opens up two possibilities of error, one for each of the two inferences. Hence it can best be considered in dealing with the second inference, *i.e.* Mental Traces of an Act (*post*, No. 147).

31. EUGENE ARAM'S CASE. (W. WILLS. *Circumstantial Evidence*. (Amer. ed. 1905. p. 104.)

In the memorable case of Eugene Aram [*post*, No. 95], who was tried in 1759 for the murder of Daniel Clark, an apparently slight circumstance in the conduct of his accomplice led to his conviction and execution. About thirteen years after the time of Clark's being missing, a laborer,

employed in digging for stone to supply a limekiln near Knaresborough, discovered a human skeleton near the edge of the cliff. It soon became suspected that the body was that of Clark, and the coroner held an inquest. Aram and Houseman were the persons who had last been seen with Clark, on the night before he was missing. The latter was summoned to attend the inquest, and discovered signs of uneasiness: at the request of the coroner he took up one of the bones, and in his confusion dropped this unguarded expression, "This is no more Daniel Clark's bone than it is mine"; from which it was concluded, that if he was so certain that the bones before

him were not those of Clark, he could give some account of him. He was pressed with this observation, and, after various evasive accounts, he stated that he had seen Aram kill Clark, and that the body was buried in St. Robert's Cave, with the head to the right in the turn at the entrance of the cave, and upon search, pursuant to his statement, the skeleton of Clark was found in St. Robert's Cave, buried precisely as he had described it. Aram was consequently apprehended and tried at York in 1759, Houseman being the sole witness against him. He was convicted and executed.

32. THE PERREAUS' CASE. [Printed *post*, as No. 361.]

33. Lord Chancellor **MACCLESFIELD'S CASE.** (1725. *HOWELL'S State Trials.* XVI, 870).

[The Chancellor was impeached on the charge of having exacted money as the price of appointments to masterships in chancery and other offices. Whether the Chancellor was privy to the dealings and bargains had by some of these appointees beforehand with the Chancellor's secretary, Mr. Cottingham, and others, was a part of the issue.]

Mr. *Elde* called.

Mr. *Lutwyche.* — My lords, we desire that Mr. Elde be sworn. (Sworn accordingly.)

Mr. *Lutwyche.* — My lords, we desire Mr. Elde may be asked when it was he was admitted a Master in Chancery?

Elde. — My lords, I was admitted the first day of February last was twelvemonth.

Mr. *Lutwyche.* — We desire he may be asked, whether he applied in person to my lord Macclesfield to be admitted into this office, and whether it was upon death or resignation?

Elde. — Upon the death of Mr. William Fellowes some of my friends came to me, and put it into my head

that this office might be a proper office for me, and I took some time to consider of it. I had some encouragement at the bar, and was very unwilling to quit it, but after two days' consideration I went to my lord himself; I told his lordship an office was fallen by the death of Mr. Fellowes; if his lordship thought me a proper person; and I should be glad to have it. I was come to wait upon him about it. His lordship said, he had no manner of objection to me, he had known me a considerable time, and he believed I should make a good officer.

Mr. *Lutwyche.* — What further discourse was there?

Elde. — My lord at that time desired me further to consider of it, and come to him again: and so I did. I went back from his lordship, and I came again in a day or two, I believe it was the second after I came back from his lordship, and told him I had considered of it, and desired to know if his lordship thought fit to admit me; and I would make him a present of 4 or 5000 *l.* I cannot say which of the

two I said, but I believe it was 5000 *l*.

Mr. *Lutwyche*. — What answer did my lord return, when you made him that proposal?

Elde. — My lord said, Thee and I, or you and I, my lord was pleased to treat me as a friend, must not make bargains.

Mr. *Lutwyche*. — My lords, we desire he may be asked, whether my lord Macclesfield said in what manner he would treat with him, whether in a more beneficial manner than anybody else?

Elde. — My lord Macclesfield did say, that if I was desirous of having the office, he would treat with me in a different manner than he would with any man living; those were the words my lord used, to the best of my remembrance.

Serj. *Pengelly*. — After this answer of my lord Macclesfield, that they must not make bargains, what further application did he make?

Elde. — I made no further application at all, but spoke to Mr. Cottingham, meeting him in Westminster-hall and told him I had been at my lord's, and my lord was pleased to speak very kindly to me, and I had proposed to give him 5000 *l*. Mr. Cottingham answered, Guineas are handsomer.

Mr. *Lutwyche*. — We desire to know what he paid, and in what manner, and in what specie?

Elde. — My lords, I paid my lord — I cannot say I paid it *him*, but I paid 5000 guineas.

Mr. *Lutwyche*. — In what manner? Who did you pay it to?

Serj. *Pengelly*. — After this agreement with Mr. Cottingham to make it guineas, as being handsomer: we desire he may inform your lordships what he did pursuant to this, and what he carried with him?

Elde. — Upon this, I immediately went to my lord's; I was willing to get into the office as soon as I could. I did carry with me 5000 guineas in gold and Bank notes: I am not certain whether there was

3000 guineas in gold, or 2000, but I think there was three, and the residue of the money was in Bank notes. This I brought to my lord's house.

Serj. *Pengelly*. — My lords, we desire he may be asked, what they were put into, or in what they were carried?

Elde. — I had the money in my chambers. I could not tell how to convey it: it was a great burthen and weight; but recollecting I had a basket in my chamber, I put the guineas into the basket, and the notes with them; I went in a chair and took with me the basket in my chair. When I came to my lord's house I saw Mr. Cottingham there, and I gave him the basket, and desired him to carry it up to my lord.

Serj. *Pengelly*. — What answer did he return?

Elde. — I saw him go upstairs with the basket, and when he came down he intimated to me that he had delivered it.

Mr. *Lutwyche*. — My lords, we desire he may be asked, whether he acquainted Mr. Cottingham with what was in the basket?

Elde. — I did not.

Serj. *Pengelly*. — After Mr. Cottingham came and acquainted you he had delivered the basket, how long after that was it before you saw my lord?

Elde. — I did not see my lord after that till I was sworn in.

Serj. *Pengelly*. — How long was that after?

Elde. — I cannot be positive; but it was within a day, either the same day, or if not, it was the next day after.

Serj. *Pengelly*. — I desire he may be asked, when Mr. Cottingham returned downstairs, after the delivery of the basket, what he said to him about the time of his being admitted?

Elde. — I do not remember he said anything to me about my being admitted: I took that for granted.

Serj. *Pengelly*. — And when he

was admitted, whether he was admitted in the closet, or in what room?

Elde.—When I was to be admitted, my lord invited me to dinner, and some of my friends with me; and he was pleased to treat me, and some members of the House of Commons, in a very handsome manner: I was after dinner sworn in before them.

Serj. Pengelly.—I desire to ask, whether he had the basket again?

Elde.—Some months after I spoke to my lord's gentleman, and desired him, if he saw such a basket, that he would give it me back; and some time after he did so.

Serj. Pengelly.—Was any money returned in it?

Elde.—No, my lords, there was not. . . .

Sir William Strickland.—I desire to know what Mr. Cottingham did say, after he had carried up the basket and came down again?

Elde.—To the best of my remembrance, he said nothing to me, but (as I repeated before) he intimated to me that he had delivered it to my lord Macclesfield. I cannot say as to any particular discourse; but I understood that he had delivered it. . . .

(*Mr. Cottingham* called again.)

Serj. Pengelly.—My lords, we left the basket in the hands of Mr.

Cottingham; therefore it is necessary that Mr. Cottingham inform your lordships what became of it afterwards; what he did with the basket after he had it from Mr. Elde?

Cottingham.—My lords, I carried it up to my lord, and set it down in his study.

Serj. Pengelly.—What did you say to my lord?

Cottingham.—Nothing. Mr. Elde ordered me to carry up the basket; I carried it up, and there I set it down: I never saw it afterwards.

Serj. Pengelly.—Whether do you remember what answer my lord Macclesfield made at that time?

Cottingham.—None that I remember.

Serj. Pengelly.—Whether did he open the basket?

Cottingham.—No; the basket was covered up, and I set it down in my lord's closet.

Serj. Pengelly.—Whether, after that time, he appointed any time for Mr. Elde to be admitted?

Cottingham.—I think he was admitted that very same day.

Serj. Pengelly.—I desire this witness may be asked, whether he received anything from Mr. Elde, besides what was in the basket?

Cottingham.—Not a farthing, except my fees: nor no more of any of the Masters than my usual fees.

34. MARY BLANDY'S CASE. (1752. HOWELL'S *State Trials*. XVIII, 1148.)

[The accused's father had refused to let Captain Cranstoun pay court to the accused, his daughter Mary. The Captain was an adventurer, and turned out later to have had a wife already. Nevertheless, Mary Blandy was in love with him, and corresponded clandestinely. The father was taken ill, and died of arsenic poisoning. Some said that the daughter had threatened his life, and poisoned him to obtain the estate and marry Captain Crans-

toun. The daughter herself admitted putting a white powder into his tea and gruel, but insisted that the powder had been sent to her by Captain Cranstoun as a love powder to change her father's mind. A domestic testifies.] . . .

What conversation passed between Miss Blandy and her father [when he became ill]?—She fell down on her knees, and said to him, "Banish me, or send me to any remote part of the world; do what

you please, so you forgive me; and as to Mr. Cranstoun, I will never see him, speak to him, nor write to him more so long as I live, so you will forgive me."

What answer did he make? He said, "I forgive thee, my dear, and I hope God will forgive thee; but thee shouldst have considered better, than to have attempted anything against thy father; thee shouldst have considered, I was thy own father."

What said she to this?—She answered, "Sir, as for your illness, I am entirely innocent." I said, "Madam, I believe you must not say you are entirely innocent, for the powder that was taken out of the water-gruel, and the paper of powder that was taken out of the fire are now in such hands, that they must be publicly produced." I told her, I believed I had one dose, prepared for my master in a dish of tea, about six weeks ago.

Did you tell her this before her father?—I did.

What answer did she make?—She said, "I have put no powder into tea; I have put powder into water-gruel, and if you are injured, I am entirely innocent, for it was given me with another intent." . . .

Did he treat her, as if she herself was innocent?—He did, Sir.

Then all he said afterwards was as thinking his daughter very innocent?—It was, Sir.

As to the ruin of his daughter, did he think it was entirely owing to Cranstoun?—Mr. Blandy said, he believed his daughter entirely innocent of what had happened. . . .

Do you imagine, from the whole conversation that passed between her father, and her, that she was entirely innocent of the fact, of the powder being given?—I do not think so; she said she was innocent.

What was your opinion, did the father think her wholly unacquainted with the effect of the powder?—I believe he thought so; that is as much as I can say. . . .

King's Counsel.—What did he mean when he said, "Poor unfortunate girl! That ever she should be imposed upon, and led away by such a villain, to do such a thing!" What do you suppose he meant by such a thing?

Gunnell.—By giving him that which she did not know what it was. . . . Here Dr. Addington is appealed to by the Counsel for the Prisoner. . . .

Prisoner's Counsel.—Did not Miss Blandy declare to you, that she had always thought the powder innocent?—Yes.

Did she not always declare the same?—Yes.

The *King's Counsel* then interposed, and said, that he had not intended to mention what had passed in discourse between the prisoner and Dr. Addington; but that now, as her own counsel had been pleased to call for part of it, he desired the whole might be laid before the Court.

Dr. Addington.—On Monday night, August 12th, after Miss Blandy had been secured, and her papers, keys, etc., taken from her, she threw herself on the bed and groaned . . . saying that she had mixed a powder with the gruel, which her father had drank on the foregoing Monday and Tuesday nights; that she was the cause of his death, and that she desired life for no end, but to go through a painful penance for her sin. She protested at the same time, that she had never mixed the powder with anything else that he had swallowed; and that she did not know it to be poison, till she had seen its effects. She said, that she had received the powder from Mr. Cranstoun, with a present of Scotch pebbles; that he wrote on the paper that held it, "The powder to clean the pebbles with"; that he had assured her it was harmless; that he had often taken it himself; that if she would give her father some of it now and then, a little and a little

at a time, in any liquid, it would make him kind to him and her. . . .

King's Counsel. — Was anything more said by the prisoner and you?

Dr. A. — I asked her, whether she had been so weak as to believe the powder that she had put into her father's tea and gruel to be so harmless as Mr. Cranstoun had represented it? Why Mr. Cranstoun had called it a powder to clean pebbles, if it was intended only to make Mr. Blandy kind? Why she had not tried it on herself before she ventured to try it on her father? Why she had flung it into the fire? Why, if she had really thought it innocent, she had been fearful of a discovery, when part of it swam on top of the tea? Why, when she had found it hurtful to her father, she had neglected, so many days, to call proper assistance to him? And why, when I was called at last, she had endeavored to keep me in the dark, and hide the true cause of his illness?

What answers did she make to these questions? — I cannot justly say; but very well remember, that they were not such as gave me any satisfaction.

Prisoner's Counsel. — She said then, that she was entirely ignorant of the effects of the powder.

Dr. Addington. — She said, that she did not know it to be poison, till she had seen its effects. . . .

Mr. Baron LEGGE. [Summing up the evidence for the jury]. — Gentlemen of the jury: Mary Blandy, the prisoner at the bar, stands indicted before you for the murder of Francis Blandy, her late father, by mixing poison in tea and water-gruel, which she had prepared for him. To which she has pleaded, that she is Not Guilty. . . . Thus far is undeniably true and agreed on all sides, that Mr. Blandy died by poison; and that that poison was administered to him by his daughter, the prisoner at the bar. What you are to try, is reduced to this single question, Whether the prisoner, at

the time she gave it to her father, knew that it was poison, and what effect it would have? If you believe that she knew it to be poison, the other part, viz. that she knew the effect, is consequential, and you must find her guilty. On the other hand, if you are satisfied, from her general character, from what has been said by the evidence on her part, and from what she has said herself, that she did not know it to be poison, nor had any malicious intention against her father, you ought to acquit her. But if you think she knowingly gave poison to her father, you can do no other than find her guilty.

The jury consulted together about five minutes, and then turned to the Court.

Cl. of Arr. — Gentlemen, are you all agreed on your verdict?

Jury. — Yes.

Cl. of Arr. — Who shall say for you?

Jury. — Our foreman.

Cl. of Arr. — Mary Blandy, hold up thy hand (Which she did). Gentlemen of the jury, look upon the prisoner: How say you, is Mary Blandy guilty of the felony and murder whereof she stands indicted, or Not Guilty?

Jury. — Guilty. . . .

On Monday, April 6th, 1752, the day destined for her execution, . . . about nine o'clock she came out of her bedchamber, and was attended by the minister to the place of execution. . . . She then addressed herself to them, with a clear and audible voice, in the following terms:

"Good people, give me leave to declare to you, that I am perfectly innocent, as to any intention to destroy, or even hurt my dear father; that I did not know, or even suspect, that there was any poisonous quality in the fatal powder I gave him; though I can never be too much punished for being even the innocent cause of his death." . . .

35. DAVID DOWNIE'S CASE. (1794. HOWELL'S *State Trials*. XXIV, 89).

[Indictment for treason by a conspiracy to subvert the government by force; one of the issues was whether Downie knew anything of the pikes prepared by order of the Committee of which he was a member.] . . . *Robert Orrock* sworn.

Mr. *Solicitor-General*. — You live at the Water of Leith? — At Dean.

Were you a member of the British Convention that met last winter? — Yes. . . .

Did you ever hear of such a thing as a Committee of Union? — Yes.

Who composed it? — I do not know.

Do you know any of them at all? — Yes. . . .

Who else? — Mr. Watts, Mr. Downie, Mr. Stoke.

Were you yourself a member of that committee? — Yes, I was.

Where did the committee meet when the society was sent to? — I do not know whether word came to, but our society met, and delegated me for to go.

Where was that? — At George Ross's.

Were you ever present at more than one meeting? — I was present at many — at different ones. I was not present every night there; often from business I could not get to attend.

Were you there when there was any conversation about arming? — Yes I was. . . . Some one there said that we had better apply for arms, and it was said again, by whom I cannot say, there need no application; for, if the Friends of the People applied to government, they would get none. It was then said, I believe by Mr. Watt, I could not, as I have now sworn, say he was the person, that there was no law in existence to hinder us from getting arms for the defense of the country; at the time upon which I was saying this conversation passed, I said I would make one. . . .

Tell now who were present. Was Downie present at this meeting of the committee? — Yes, Mr. Downie, Mr. M'Ewan, Mr. Bonthron. . . .

You accordingly made such a weapon? — Yes, I did. . . . After I had made it, I was in the Committee of Union.

Did you produce the two weapons in the committee or the other room? — In the other room.

Who desired you to come there? — A lad came to me, I am sure I could not recollect his name; I produced them in the other committee, not the Committee of Union.

What do you call the Committee of Union? — It was the Sub-Committee. There was Watt, Downie, Bonthron, M'Ewan, and another man I did not know. . . .

You were desired to make some more? — They asked me what would be the price.

Who asked you? — Mr. Watt: after that, Mr. Downie said not a word, he spoke no more, and the conversation was carried on by Watt, it was not long, it was a few minutes. Watt said, what is the price of them? I said, I cannot say; I had only made that on the stick, and this part of it; I had not made any more of them, I desired to go out, which I did, and I went into the other room, and he told me, says he, you will make a few of these. . . .

Was Downie with you, when Mr. Watt gave you orders to make a few? Yes, says he, make a few. . . .

Court. — Were you paid by anybody? — I was paid, not then: I suspected Watt to be my paymaster, but M'Ewan came to me that night, and said, I was to be paid by Mr. Downie, and he was to pay me the whole I had the commission for, which was 5 dozen; he brought me that word.

Did you ever go to Downie's in consequence of that order? — No.

You made those pikes in consequence of that order?—The only order, when Downie was present, was only to make a few.

Court.—You say now to make two or three dozen. Robert Orrock, I beg you will pay attention, for you said “only a few.”

Did you ever go to Mr. Downie?—No.

Did you ever deliver any to Mr. Watt?—No more than the two to the committee. . . .

William Brown sworn.

Mr. Anstruther.—Mr. Brown, had you ever an order to make any of these things?—Yes.

Did you ever make any?—Yes.

How many did you make?—I made 14 of that kind, and one like this.

Show which?—I made 14 of that kind, and one of that (the single spear 14, the other the halberd).

Did you deliver these pikes? Yes, I took them to Mr. Watt one afternoon; Mr. Watt, when I took them in, told me he was sorry he had not money to pay me; I told him I was needing the money; he seemed as if he would borrow the money—he said Mr. Downie would pay me; he gave me a line to Mr. Downie to pay me. . . .

Was there no other order?—No order what it was for.

Had you any conversation about it with Mr. Downie?—I am not certain but Mr. Downie might have asked me how Mr. Watt was, but there was no altercation between Mr. Downie and me. I got the money upon Mr. Watt's line.

You did not say to Downie what it was for?—No, he never asked me.

Cross-examination.

Mr. Clerk.—Did Downie ask you what the money was for?—No, he did not.

Mr. Anstruther.—Your evidence is this—Watt gave you an order upon Downie, and Downie paid you the money; is not that it?—Yes.

Downie paid you the money? Yes. . . .

Defense.

Mr. Cullen.—Gentlemen of the Jury;— . . . With regard to the circumstance of making these arms, I will endeavor to state to you the substance of the evidence; and I trust I shall do it fairly. The first witness is William Orrock, a smith, who was a member of the society of the Friends of the People, at the Water of Leith, and one of their delegates to the Committee of Union. He gives you a history of these pikes from the beginning. . . . Orrock next tells you, of his being one day sent for by Watt to come and speak to him in the house of Arthur M'Ewan at the Water of Leith, and he then told Watt what kind of weapon he had made. Upon this, Watt said, a different one would be better, and accordingly Orrock made one agreeable to Watt's directions. . . . He next tells you, that after he had left the room, and before he quitted the house, Watt came to him, and repeated the same directions, and that Downie was then along with Watt; and he farther says, that afterwards Watt came to him at his own house, and desired him to make towards three dozen of them. The next witness was William Brown, likewise a smith; and he tells you, that, by the orders of Mr. Watt, he made fourteen pikes of one kind, and one of another kind, and brought them all home to Watt. Upon asking payment, Watt said, he was sorry he had not money then to give him, but the witness mentioning that he needed money at the time, Watt said, that although he had not then money himself, he would get it from another person, and accordingly he wrote, and gave him an order upon Downie, for the money, which was 1*l.* 2*s.* 6*d.* This order did not in the least mention what the money was for, and when Brown went to Downie and got the money, he tells you, that he did not say a single word to Downie

as to what the money was for, nor did Downie ask him. It was an order in the same way, as if Watt had been borrowing the money from Downie. . . . Brown tells you, that all those which were made by him, he carried home to Watt. Those again made by Orrock, were seized while they were still in Orrock's own possession. The sheriff-officers tell you, that although they made the strictest search, yet they could find no such thing in Downie's house. . . . Brown tells you, that it was Mr. Watt alone who employed and directed him to make those pikes, and that no other person ever spoke to him on the subject. He made them for Watt, and when they were made, he carried them home to Watt. Downie was not present when the order was given, nor is there the least reason to suppose that he knew anything at all of the matter. As to the circumstance of Brown's receiving payment from Downie, you have heard how it happened. Watt, not having the money when Brown pressed for it, gave an order upon Downie for it; but that order did not express what the money was for; and Brown expressly tells you, that he neither told Downie what it was for, nor did Downie ask him. In short, it was nothing more than the trifling sum of 1*l.* 2*s.* 6*d.* which Downie advanced for Watt, without inquiring or knowing what it was for; and you have no reason to suppose, and still less any right to conclude, that Downie knew the money he thus advanced was for making pikes.

Anything said by Brown, therefore, does not, in the most distant degree, affect Mr. Downie. . . . As to his afterwards bringing up two to George Ross's, and showing them there one evening in a company where Mr. Downie was present, you will remark, he does not say that he had been desired to do so, nor that he had any sort of orders for these pikes, either from the Committee of Union, or from the Subcommittee of Ways and Means. Indeed, you have not the least evidence, that either of those committees did ever authorize any such thing, or know anything about the making these weapons; and you have not only no evidence, but you have not even the shadow of reason to suppose, that Mr. Downie ever heard of, or knew anything about the pikes, till they were accidentally brought in the way I have mentioned, and shown to the company in which he happened to be at Ross's. . . . And it is of great importance for you to remark, gentlemen, that, excepting upon this single occasion at George Ross's, there is not so much as a word in the evidence, either of Orrock, or of any other witness, which can tend to show that Mr. Downie gave any orders, had any concern, or knew anything whatever regarding those pikes. In short, if you are to fix any guilt upon him as to this business, it must be founded on the solitary testimony of this Mr. Orrock, swearing to casual words passing at a tavern meeting, where Mr. Downie happened to be present.

36. *Lord COCHRANE'S CASE.* (ARTHUR GRIFFITHS. *Mysteries of Police and Crime.* 1898. Vol. I, p. 223.) . . .

The prosecution and conviction of Lord Cochrane in 1814 may well be classed under this head, for it was distinctly an error of "la haute police," of the Government, which as the head of all police, authorizes the pursuit of all wrongdoing, and sets the criminal law in motion

against all supposed offenders. It has now been generally accepted that the trial and prosecution of Lord Cochrane (afterwards the Earl of Dundonald) was a gross case of judicial error.

He was charged with having conspired to cause a rise in the public

Funds by disseminating false news. There were, no doubt, suspicious circumstances connecting him with the frauds of which he was wrongfully convicted, but he had a good answer to all. His conviction and severe sentence, after a trial that showed the bitter animosity of the judge (Ellenborough) against a political foe, caused a strong revulsion of feeling in the public mind, and it was generally believed that he had not had fair play. The law, indeed, fell upon him heavily. He was found guilty, and sentenced to pay a fine of £500, to stand in the pillory, and to be imprisoned for twelve months. These penalties involved the forfeiture of his naval rank, and he had risen by many deeds of conspicuous gallantry to be one of the foremost officers in the British navy. His name was erased from the list of Knights of the Bath, and he was socially disgraced. How he lived to be rehabilitated and restored to his rank and dignities is the best proof of his wrongful conviction.

The story as told by Lord Cochrane himself in his affidavits will best describe what happened. Having just put a new ship in commission, *H. M. S. Tonnant*, he was preparing her for sea with a convoy. He was an inventive genius, and he had recently patented certain lamps for the use of the ships sailing with him. He had gone into the city one morning, the 21st of February, 1814, to supervise their manufacture, when a servant followed him with a note. It had been brought to his house by a military officer in uniform, whose name was not known, nor could it be deciphered from the illegible scrawl of the letter. Lord Cochrane was expecting news from the Peninsula, where a brother of his lay desperately wounded, and he sent back word to his house that he would come to see the officer at the earliest possible moment. When he returned he found a person he barely knew, who gave the name

of Raudon de Berenger, and told a strange tale. He was a prisoner for debt, he said, within the rules of the King's Bench, and he had come to Lord Cochrane to implore him to release him from his difficulties and carry him to America in his ship. His request was refused—it could not be granted, indeed, according to naval rules; and de Berenger was dismissed. But before he left he urged piteously that to return to the King's Bench prison in full uniform would attract suspicion. It was not stated how he had left it, but he no doubt implied that he had escaped and changed into uniform somewhere. Why he did not go back to the same place to resume his plain clothes did not appear. Lord Cochrane only knew that in answer to his urgent entreaty he had lent him some clothes. The room was at that instant littered with clothes, which were to be sent on board the *Tonnant*, and he unsuspectingly gave de Berenger a "civilian's hat and coat." This was a capital part of the charge against Lord Cochrane.

De Berenger had altogether lied about himself. He had not come from within the rules of the King's Bench but from Dover, where he had been seen the previous night at the Ship hotel. He was then in uniform, and pretended to be an aide-de-camp to Lord Cathcart, the bearer of important dispatches. He made no secret of the transcendent news he brought, viz., that Bonaparte had been killed by the Cossacks, Louis XVIII proclaimed, and the allied armies were on the point of occupying Paris. To give greater publicity to the intelligence, he sent it by letter to the port-admiral at Deal, to be forwarded to the government in London by means of the semaphore telegraph. The effect of this startling news was to send up stocks 10 per cent, and many speculators who sold on the rise realized enormous sums. De Berenger, still in uniform, followed in

a post chaise, but on reaching London he dismissed it, took a hackney coach, and drove straight to Lord Cochrane's. He had some slight acquaintance with his lordship, and had already petitioned him for a passage to America, an application which had been refused. There was nothing extraordinary, then, in de Berenger's visit. His lordship, again, claimed that de Berenger's call on him, instead of going straight to the Stock Exchange to commence operations, indicated that he had weakened in his plot, and did not see how to carry it through. "Had I been his confederate," says Lord Cochrane, in his affidavit, "it is not within the bounds of credibility that he would have come in the first instance to my house, and waited two hours for my return home, in place of carrying out the plot he had undertaken, or that I should have been occupied in perfecting my lamp invention for the use of the convoy, of which I was in a few days to take charge, instead of being on *the only spot* where any advantage to be derived from the Stock Exchange hoax could be realized, had I been a participator in it. Such advantage must have been immediate, before the truth came out; and to have reaped it, had I been guilty, it was necessary that I should not lose a moment. It is still more improbable that being aware of the hoax, I should not have speculated largely for the special risk of that day."

We may take Lord Cochrane's word, as an officer and a gentleman, that he had no guilty knowledge of de Berenger's scheme; but here again the luck was against him, for it came out in evidence that his

brokers *had* sold stock for him on the day of the fraud. Yet the operation was not an isolated one made on that occasion only. Lord Cochrane declared that he had for some time past anticipated a favorable conclusion to the war. "I had held shares for the rise," he said, "and had made money by sales. The stock I held on the day of the fraud was less than I usually had, and it was sold under an old order given to my brokers to sell at a certain price. It had necessarily to be sold." It was clear to Lord Cochrane's friends — who, indeed, and rightly, held him to be incapable of stooping to fraud — that had he contemplated it he would have been a larger holder of stock on the day in question, when he actually held less than usual. On these grounds alone they were of opinion he should have been absolved from the charge.

Great lawyers like Lords Campbell, Brougham, and Erskine have commented on this case, all of them expressing their belief in Lord Cochrane's innocence. The late Chief Baron, Sir Fitzroy Kelly, in criticizing the trial, ends by expressing his regret that "we cannot blot out this dark page from our legal and judicial history." These are the opinions of legal luminaries in the fullest mental vigor and acumen at the time of the trial. They were intimately acquainted with all the facts, and we may accept their judgment that a great and grievous wrong has been done to a nobleman of high character, who had not spared himself in the service of the State. Their view was tardily supported by the Government in restoring Lord Cochrane to his rightful position.

37. **FORBES v. MORSE.** (1896. SUPREME COURT OF VERMONT. 69 Vt. 220.)

Case for enticing away the plaintiff's servant. Plea, the general issue. Trial by jury at the March Term, 1896, Rutland County, TAFT,

J., presiding. Verdict directed, and judgment thereon rendered, for the defendant. The plaintiff excepted.

On July 30, 1890, a contract was

made between the plaintiff and Lucy Wells that she should keep the plaintiff's house and look after his children so long as they should need a home there and that the plaintiff should treat her kindly and discontinue certain law suits between them. She was not to begin until her parents ceased to need her care. Her father having died September 24, 1890, she entered upon her performance of the contract November 8, 1890, and continued thereunder until about May 1, 1891, when she left the plaintiff's service without his consent. The plaintiff testified that he found the letter recited below upon a stand in Miss Wells' room during her stay at his house; that it was in the defendant's [her brother's] handwriting, and that the copy produced was made by him and is correct; that many letters passed between the defendant and Miss Wells while she was at his house; that there was an envelope with the letter in question which was new in appearance, but that he did not copy it and could not remember its date. The plaintiff produced no other testimony as to the time when the letter was written or received. The letter read as follows: "Home, Sabbath P.M. My Dear Sister:— Having a postal to send you, thought you would pardon me if I should add a few lines. I am lonely to-day and should be so happy if you were here to chat with me. Since I wrote you I have taken a very short vacation. Left home Thursday at 3.40 for Holyoke, Mass., stopped over night with cousins in North Adams. Next day went on to Holyoke and returned last eve. I had as pleasant a time as one would naturally have all alone. Bought quite a bill of stationery. Saw Mr. Dr. Hemner a few moments. Weather was terrible hot and some rain. Tuesday has been more comfortable. My dear sister, it does seem so strange to have you away from here and Castleton too. It grows more lonely each day. It

seems some times as if I never was to see you again. Saw Judge Bromley on the train last eve., says he heard from pretty good source that Prof. Leavenworth and Miss Wardsworth were to be married before school opened. This is all a secret. What do you think about it, wouldn't we have some talking to do if — was to carry you to Castleton to-night? Must not write more now. Wish you could see my sweet peas; they are just immense. Wish I could pick you some to-night. Lucy, I wish you could have heard Mr. B. last night. It seemed just the thing for you. Of course we always find some one else for the coat to fit. He said rash promises were far better broken than kept. I do so wish you were back at Castleton. You cannot think how strange it seems to me coming through there one week ago Sunday eve., to think I could perhaps never stop there as I have so many times and receive your pleasant welcome. I think you had better come back. I mean just what I say and I am sure unless you feel different from what I think you do that it is your solemn duty to come. Wouldn't we all try to be happy once more? You do not know how much I miss you. But I must not say so, must I? Would send you some sweet peas if it would do. We have lots of them and they do look so fine from my window where I am writing. But I must close. I will only add, that if you do not like Mr. Forbes I think it very unkind in him to ask you to leave your school and sacrifice so much for him. Love to Herbert and much for yourself, from Brother Frank." The court ruled that there was no evidence tending to show that the letter was written or received between July 30, 1890, when the contract was made, and the May following, when Miss Wells left the plaintiff's service, and excluded the letter; to which the plaintiff excepted. The court also

excluded, against the plaintiff's exception, the deposition of B. G. Howe, the substance of which is stated in the opinion. Miss Wells and a deceased wife of the plaintiff and a deceased wife of the defendant, were sisters. The defendant was married to Miss Wells in May, 1892.

Horace W. Love, for the plaintiff. *Henry A. Harman* and *George E. Lawrence*, for the defendant.

MUNSON, J.—On the thirtieth day of July, 1890, Lucy Wells contracted with the plaintiff to become his housekeeper upon the happening of a certain contingency. She entered the plaintiff's service under this contract on the eighth day of November, 1890, and remained in it until the first of May, 1891. The plaintiff claims that she was enticed from his service by the defendant. The plaintiff offered evidence of the contents of an undated letter in the defendant's handwriting, which was found on a stand in Miss Wells' room during her stay at the plaintiff's, having with it an envelope which had the appearance of being new. The court excluded this evidence on the ground that there was no testimony tending to show that the letter was written after the thirtieth of July, 1890, the date of Miss Wells' contract with the plaintiff. It doubtless might have been held that there was no evidence tending to show that it was written after the eighth of November, the day Miss Wells entered upon her service; for the

letter itself shows that it was written just after a period of extreme heat, and while the sweet peas visible from the writer's window were in full bloom. But a further consideration is necessary to determine whether there was evidence tending to show that it was written after July thirtieth, the date of the contract. The whole burden of the letter is the writer's regret for Miss Wells' absence, and for the prospect of her continued absence from Castleton, where she had been teaching. The last sentence connects the plaintiff by name with the subject matter of the writer's regret. "If you do not like Mr. Forbes, I think it very unkind in him to ask you to leave your school and sacrifice so much for him." If this stood alone, it might seem to point to some proposition made, rather than to an arrangement actually entered into. But the writer had just before expressed his regret that she had not heard the recent remark of another, that "rash promises were far better broken than kept," saying, "it seemed just the thing for you." When the two are taken together they seem to refer to something which Miss Wells has agreed to do for the plaintiff which is inconsistent with the continuance of her work as a teacher. It must therefore be held that the letter itself affords evidence that it was written after the contract above referred to was made. . . .

Judgment reversed and cause remanded.

38. WILLIAM BARNARD'S CASE. (1758. *HOWELL'S State Trials*. XIX, 824).

[Attempted blackmail by sending threatening letters. The Duke of Marlborough had received three threatening letters, in close succession, demanding benefits, and appointing an interview. The Duke kept the appointments. Each letter showed apparently a knowledge of the Duke's conduct at the prior

occasion. The accused being present on all three occasions, and no other person, he was arrested and charged]. . . .

The *Duke of Marlborough* sworn.

Duke of Marlborough. — I received this letter from an unknown hand, dated the 29th of November, and directed to me, appointing me

to meet the writer on a certain spot in Hyde Park.

The first Letter read: "To his Grace the Duke of Marlborough.— With care and speed. My lord: November 29th. As ceremony is an idle thing upon most occasions, more especially to persons in my state of mind, I shall proceed immediately to acquaint you with the motive and end of addressing this epistle to you, which is equally interesting to us both. You are to know, then, that my present situation in life is such, that I should prefer annihilation to a continuance in it; desperate diseases require desperate remedies; and you are the man I have pitched upon, either to make me, or to unmake yourself.

. . . It has employed my invention for some time to find out a method to destroy another, without exposing my own life; that I have accomplished, and defy the law. Now for the application of it. I am desperate, and must be provided for; you have it in your power; it is my business to make it your inclination, to serve me; which you must determine to comply with, by procuring me a genteel support for my life; or your own will be at a period before this sessions of parliament is over. I have more motives than one for singling you out first upon this occasion; and I give you this fair warning, because the means I shall make use of are too fatal to be eluded by the power of physic. If you think this of any consequence, you will not fail to meet the author on Sunday next, at ten in the morning, or on Monday (if the weather should be rainy on Sunday), near the first tree beyond the stile in Hyde Park, in the foot-walk to Kensington; secrecy and compliance may preserve you from a double danger of this sort; as there is a certain part of the world, where your death has more than been wished for, upon other motives. I know the world too well to trust this secret to any breast but my own.

A few days determines me your friend or enemy. Felton." "You will apprehend that I mean you should be alone; and depend upon it, that a discovery of any artifice in this affair will be fatal to you; my safety is insured by my silence; for confession only can condemn me."

Q. What did your grace do upon receipt of this letter?

Duke of Marlborough.—I went to the place at the time appointed. It was at the first tree near the stile in Hyde Park, in the way to Kensington, at the end of the Serpentine water, betwixt that water and a little pond. I was there some time, and saw nobody stop that I could suspect to be the person; upon which I was going away; but as I came to Hyde Park corner, I turned my horse, and saw a person stand loitering, and looking at the water over the bridge. This was, I believe, within twenty yards of the tree, and this induced me to go back again. I rode up to the person very gently, and passed by him once or twice, expecting him to speak to me, but he did not. I made him a bow, and asked him, if he had something to say to me? He said, No, I don't know you. I said, I am the Duke of Marlborough; now you know me, I imagine you have something to say to me. He said, No, I have not. Then I rode away.

Was your grace armed?—I had pistols before me.

Had your grace any great coat on?—No, I had not. My star might easily be seen.

Does your grace see anybody here that you saw there?—It was the prisoner at the bar.

Had your grace any servant or attendant with you?—I had no servant with me; there was a person, a friend of mine, at a good distance in the Park. A day or two after, I cannot be sure whether it was the next day, or the day after that, I received a second letter.

Counsel for the prisoner.—I am under a great difficulty, whether

I shall object against this letter being read or not. . . .

Court.—The use made of this letter is to support the evidence of the first letter, let the contents be what they will. The use they make of it is to show, that the prisoner at the bar was the writer or sender of the first letter.

The second Letter read :

“To his grace the Duke of Marlborough.—My lord; You receive this as an acknowledgment of your punctuality as to the time and place of meeting on Sunday last, though it was owing to you that it answered no purpose. The pageantry of being armed, and the ensign of your order, were useless, and too conspicuous; you needed no attendant; the place was not calculated for mischief, nor was any intended. If you walk in the west-isle of Westminster Abbey, towards eleven o'clock on Sunday next, your sagacity will point out the person, whom you will address by asking his company to take a turn or two with you. You will not fail, on inquiry, to be acquainted with the name and place of abode, according to which directions you will please to send two or three hundred-pound Bank notes the next day by the penny-post. Exert not your curiosity too early; it is in your power to make me grateful on certain terms. I have friends who are faithful; but they do not bark before they bite. I am, &c. &c. F.”

Q. What did your grace do upon the receipt of this second letter?

D. of Marlborough.—I went to Westminster Abbey at the time the letter appointed. I had been walking there about five or six minutes before I saw anybody that I suspected; then I saw the person I had seen before in Hyde Park, and another person who seemed to be a good-looking man, a substantial tradesman; they came in and looked on the monuments. I, knowing the person again, went and stood by them; but the prisoner said

nothing to me; soon after they both of them went towards the choir; the stranger, I may call him, went into the choir, and the prisoner turned back and came towards me, but did not speak to me. Then I asked him, if he had anything to say to me, or any commands for me? He said, No, my lord, I have not. I said, Sure you have? He said, No, my lord. He walked up and down one side the isle and I the other to give him a little more time; but he did not speak; then I went out at the great door and left him in the Abbey. I looked back to see if he watched me going out, but I did not see him.

Q. Had your grace anybody with you in the Abbey? *A.* There were two or three people placed in disguise, ready, if I had given them the signal, to have him taken up. Though I was certain it was the same person whom I had seen and spoken to in the Park, I thought not proper to give the signal, but to run a little longer risk rather than to take up an innocent man. Very soon after this I received another letter; this is it.

The third Letter read: “To his Grace the Duke of Marlborough.—My lord.—I am fully convinced you had a companion on Sunday. I interpret it as owing to the weakness of human nature; but such proceeding is far from being ingenuous, and may produce bad effects; whilst it is impossible to answer the end proposed. You will see me again soon, as it were by accident, and may easily find where I go to. . . . These and the former terms complied with, insure your safety; my revenge, in case of non-compliance (or any scheme to expose me) will be slower, but not less sure. . . . The family of the BLOODS is not extinct, though they are not in my scheme.”

Duke of Marlborough.—At about two months after the receipt of this, I received another letter; this is it.

The fourth Letter read: "To his Grace the Duke of Marlborough. — May it please your grace; I have reason to believe, that the son of one Barnard, a surveyor in Abingdon buildings, Westminster, is acquainted with some secrets that nearly concern your safety; his father is now out of town, which will give you an opportunity of questioning him more privately. It would be useless to your grace, as well as dangerous to me, to appear more publicly in this affair. Your sincere friend, Anonymous." "He frequently goes to Storey's Gate coffee house."

Duke of Marlborough. — There is no date to this letter. About a week or ten days after I received this letter, I sent a message to the coffee-house, by Mr. Merrick, who returned and told me he found Mr. Barnard there, and that he said, "What could the Duke of Marlborough want with him?" He had spoke with him once in Hyde Park, and another time in Westminster Abbey. The messenger told me, he said he would wait on me, which he did at Marlborough House, about half an hour after ten o'clock, I think, on the Friday following.

Prisoner. — It was Thursday, my lord.

Duke of Marlborough. — I cannot be sure as to the day. When he came in, I knew, at first sight, it was the same person that I had seen in the Park and in the Abbey. I desired him to walk with me into a room, and immediately shut the door when we were in. I asked him as before; he said, he had nothing to say to me; then I told him of the last letter I received, that it mentioned his name, and that he knew something concerning my safety; he said he knew nothing of it. Then I recapitulated all the letters, beginning with the first, and remarked to him, that it was strange to me, that a man that wrote so very correct, without false English in any shape, should be guilty of so low an action; he said,

A man may be very learned and very poor. I then took notice of the second letter, and said, there must be something very odd in the man; he said, I imagine the man must be mad. I said, he seems surprised that I should have pistols; said he, I was surprised to see your grace with pistols, and your star on. I said, why was you surprised at that? His answer was, after stopping a moment, it was so cold a day; I wondered you had not a great coat on; then I afterwards showed him the letter again where his name was mentioned, and walked with him to the window; and as I read it, when I came to that part where it said his father was out of town, he said, it is very odd, my father was then out of town. I said nothing to him of that, though it struck me a good deal, as there was no date to the letter. I said, if you are innocent, it behoves you much more than me to find out the author of those letters, particularly the last; for it was an attempt to blast his character behind his back; he seemed to give me a smile, and away he went. I did not apprehend him then. . . .

Counsel for defense. — In consequence of the first letter, your grace went into the Park on horseback, and was there some time without seeing anybody you suspected. Were there not people there? — *D. of Marlb.* I saw several people on horseback, and some few walking in a hurry on foot.

Pray, my lord duke, after you had seen this person loitering, was there anything going forward, such as hunting a duck, or the like? No, nothing in the world as I saw; it was a very cold day.

Your lordship said there was another person at a distance, an attendant on your grace; How far might that person be off when you was speaking to the prisoner? I cannot tell exactly. I had spoke to him to keep a great way off.

Was he in view of your grace? I dare say he was.

he had met the duke of Marlborough, and these circumstances of his grace's taking notice of him; he mentioned it as an extraordinary thing. I asked him, if he had not looked a little impudently (as he has a near sight) at him, or pulled his glass out? He said, he saw another gentleman at a distance, and the duke was armed; and he imagined there might be a duel going forwards; he has from that time to this mentioned it as a very strange event several times in my house, without any reserve at all.

Cross-examination. . . .

Did you hear him mention his seeing the duke of Marlborough in Westminster Abbey?—I have very often, and very publicly, and with some surprise; as he has that in Hyde Park. I said to him, I would not have you be public in speaking of things of this kind, lest a use be made of it to your disadvantage.

Thomas Barnard sworn.

T. Barnard.—I am first cousin to the prisoner at the bar. On Saturday, the 3d of December, I was at Kensington, and lay at my uncle's house there and dined there. On the Sunday the prisoner came there before dinner, he said he had been to do some business that way. He dined with us; there were my uncle, aunt, he, and I; he related that circumstance to us of meeting with the duke of Marlborough in Hyde Park; he said he rode up to him, and asked if he knew who he was; he answered, No; he replied, I am the duke of Marlborough. He related it with some cheerfulness, though as a matter of surprise.

How long have you known the prisoner?—From his birth; he is in business with his father; I always understood he would succeed his father; I never knew him to behave any otherwise than well in my life. I never thought him extravagant, nor never heard so; I had always looked upon him to be an honest man; his father is in very great business. . . .

Joseph Barnard sworn.

J. Barnard.—I am uncle to the prisoner at the bar; I live at Kensington; my nephew Thomas Barnard lay at my house on the Saturday night, and dined with the prisoner at the bar on the Sunday. I remember he then mentioned having met with the duke of Marlborough in Hyde Park, while we were sitting at dinner. I said I was surprised he should meet with him that day; he said he saw but one gentleman at a distance, and that the duke was armed; and his grace looked him full in the face, very earnestly (which he seemed to speak with a great deal of pleasure to me); he is very nearsighted, he can see nothing at a distance without the use of a glass. I have heard him since speak four or five times of seeing the duke in Westminster Abbey. . . .

Thomas Calcut sworn.

T. Calcut.—I live at Kensington; I remember the prisoner coming there on a Sunday morning; a very cold, foggy morning; with some message from his father to me, to know whether the solicitor had paid some money or not. He was under his father, as I am under mine; he desired me to go with him; I said, stay and dine with me; he said, he could not promise, because he had promised to dine with his uncle Joseph; he went into the parlor, and said, it is vastly cold; there has been the oddest accident happened as I came over the Park! the duke of Marlborough came up to me, and asked me, if I knew him? I said, No; He asked me, if I wanted anything with him? I told him, No. He said, I am the duke of Marlborough, if you want anything with me; then the duke went away, and he came there. He expressed a great surprise at it, and I thought it a very odd affair. . . .

Mrs. Mary Wilson sworn.

Mrs. Wilson.—I dined at Mr. Barnard's on Thursday, the 8th of December; the prisoner I remem-

ber said he had been in Hyde Park some days before, and there he saw a gentleman on horseback come up to him, and asked him, if he had anything to say to him? He said, No; then he said, I am the duke of Marlborough, now you know me, have you anything to say to me? He said, No. He talked of this very freely to us all.

James Greenwood sworn.

Greenwood.—I live at Deptford, with a relation in the brewing way; I came from Deptford on Saturday to the prisoner's father's; and on the Sunday following I was there at breakfast; I solicited the prisoner to get himself dressed to go with me into the Park, being to meet a person at twelve o'clock; I with a good deal of difficulty got him to dress himself; I put my shirt on in the parlor, and after that he put on his; I fancy we breakfasted about nine o'clock; when we got to the end of Henry VII's chapel, the prisoner would have gone the other way into the Park without going through the Abbey; I took hold of his sleeve, and said, Barnard, you shall go through the Abbey. . . . After we had stayed there some time, I saw his grace the duke of Marlborough, who was got pretty near us; upon seeing the duke, I jogged him by the elbow, and said, step this way; he seemed to look at him.

Had you heard what happened in Hyde Park previous to this?—I had; I believe it was told me by the prisoner at the bar; on my jogging him we walked up the middle isle towards the choir. I said, did you see that gentleman in the blue coat, or do you know him? No, said he, not I. No? said I, it is the duke of Marlborough; we will walk to the monument again. The duke came, and placed himself pretty near me a second time; after this we walked away. . . .

Why did you jog him?—Because he is very nearsighted. At last I think it so happened, we passed the duke between two of the pillars;

and as I had hold of his arm walking together, there was barely room for three people to pass abreast; the duke rather gave way, and made, as I thought, a kind of bow. Upon this I said, the duke of Marlborough's behavior is extremely particular; he certainly has something to say to you; I suppose he does not choose to say it while I am with you, I will go into the choir, and do you walk up and down here, and he will possibly speak to you. While I was there, I looked; the first thing I saw was the duke of Marlborough and the prisoner at the bar, with their heads bowing together, as if it was the first salutation.

Had the prisoner the least inclination to go into the Abbey before you proposed it to him?—No; he did not discover any.

Did he discover any inclination to be left alone, when you proposed to go into the choir?—No, he did not in the least; in some few minutes after, the prisoner and I met together, he told me the duke of Marlborough was gone out of the Abbey, he had seen him go out. I said, What passed? To which he replied, the duke said, did you speak to me? or who spoke first I cannot tell.

In this transaction did the prisoner appear openly, or as if he had some secret transaction to do with the duke?—No, it was open and clear.

Did you see the duke come in?—No, I did not; we were employed in looking at the monuments; we looked at several. . . .

Where did you go when you went out of the Abbey?—We went immediately into the Park; and after walking there, we met with two ladies whom I knew, and to whom Mr. Barnard was not unknown, to whom we related this affair; he always related these things, that is, this and that in Hyde Park, as matter of great curiosity.

How long have you been acquainted with him?—I have been acquainted with him seven years.

What is his character? — I know nothing to the contrary but that he is an industrious, sober young man.

Did you ever hear that he was a profligate, expensive young man? — No, never.

His father is in great business, is he not? — His father's business is a very considerable thing. . . .

The Rev. Dr. Markham sworn.

Dr. Markham. — I have known the prisoner some years; I have always considered him as a young man of remarkable sobriety and attention to business. I have had some experience of him; I intrusted him with the execution of some matters of importance relating to myself. . . . If he had come to me wanting money, he might easily have imposed on me; he might have had anything of me; he is one of the chief persons I trusted, and I don't know a man on whom I would have had a greater reliance; I thought him remarkably able in his business, and very likely to be a considerable man; and I never was more astonished in my life than when I heard this strange story. . . .

Mr. Serjeant Davy (for the prosecution):

My lord, and gentlemen of the jury; I am sorry to take up any more of your time; but the defense consisting of various parts, I would beg leave to trespass a little longer on your patience. . . . I do not mean to draw your attention back to the several circumstances of the prosecution; they are all before you, and they are too strong and striking to be easily forgot. . . . It will remain for your consideration, it is now the capital question, whether these circumstances laid before you, consisting of five or six parts on the part of the prisoner, may be reconciled with the suspicion of his guilt? Because, if they may, it is no defense at all. Gentlemen, the first is, the prisoner being sent by his father to Kensington on this Sunday on which he met the duke in Hyde Park. . . . His father

talked of his going; he did go — what does that prove? Does it prove he was not to go to Hyde Park any other way? Whoever was the writer of these letters, certainly intended to have a meeting on both the Sundays, in the Park and in the Abbey, in a very public manner. . . . Gentlemen, the next part of the defense is, that he at several times and to several people related the meetings he had had with the duke, and the extraordinary occurrences. This indeed corresponds with the observations I made: the writer of these letters proposed to meet the duke at a time that people were walking out on a Sunday, and in the Abbey, the most public places, and at the most public times: is that irreconcilable with the suspicion that the prisoner (if he was the author of these letters) might have been contriving with other persons, telling people of the several meetings he had had with the duke, and the substance of those meetings?

. . . The next circumstance is, Mr. Greenwood's evidence of going with him to Westminster Abbey. . . . There is not a circumstance in all that part of the story of Mr. Greenwood's evidence, which suits so well as this of his guilt; first he wanted to get rid of Mr. Greenwood, and when he could not do that, then making no secret of having seen the duke, and make that tally with his telling him he had met him. . . .

These are all the circumstances that they have insisted upon as proofs of his innocence, except one, that is his character. . . . Gentlemen, when you come to consider that, character goes but a very little, and indeed no way at all, towards proving his innocence. . . . Might it not happen that, a man betwixt twenty and thirty years of age, dependent in some measure upon his father, might have a secret call for money, which he would wish his father, and those friends that are fond of lending money, not to be acquainted with? We know very

well, there are certain circumstances, some in this capital city of London, where a man might be very hard driven for the want of money, which he would choose to hide from his friends. . . . Gentlemen, he is safe in your hands. I doubt not but that you will do your duty;

if you think him guilty, you will find him so; if not, you will acquit him. With regard to the duke, his grace has discharged his duty which he owed to the public, which he will at all times do, and is perfectly indifferent about the issue of it.

The jury acquitted the prisoner.

SUBTITLE D: EVIDENCE TO PROVE PLAN (DESIGN, INTENTION)

39. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹

General Principle. The existence of a design or plan is usually employed evidentially to indicate the subsequent doing of the act designed or planned (*post*, Nos. 121–129). The question here is how such a design or plan may be evidenced circumstantially. Of the three conceivable sorts of circumstantial evidence (*ante*, No. 3), only two are practically available, viz. : (1) Conduct, as indicating the inward existence of a design ; (2) Prior or subsequent existence of the design, as indicating its existence at the time in question.

Design or Plan is to be carefully distinguished from Intent. In many parts of the substantive law, particularly in the criminal law, the state of mind accompanying an act becomes legally important, and is for such purposes one of the propositions in issue. This may be termed Intent. It is not used evidentially to prove something else ; it is one of the ultimate parts of the issue. Design or Plan, on the other hand, has almost invariably (except where a conspiracy is charged) a purely evidential use ; the inference is to be from the Design to the Act, and thus the Design must in its turn be evidenced.

Design must also be distinguished from Emotion or Motive (anger, jealousy, and the like). Thus, threats of violence may evidence both a Design and an Emotion.

Sundry Instances (Tools, Materials, Liquor Licenses, Preparations, Journeys, Experiments, Inquiries, Prophecies, and the Like). The kinds of conduct which may evidence a design are innumerable in their variety.

The acquisition or possession of instruments, tools, or other means of doing the act, is admissible as a significant circumstance ; the possession signifies a probable design to use ; *e.g.* the possession of the apparatus or a license for gaming or for selling liquor, evidences a design to game or to sell. The presence of a person at a place or a journey towards it, together with behavior showing a desire for secrecy, may indicate a design to commit an unlawful act there. Where a person makes inquiries, either by word of mouth or by messenger, or by experimentation searches for knowledge, it is natural to infer that he designs to use the knowledge thus sought ; and if the knowledge is needed or is adapted to help in doing the act in question, the inquiries or experiments are thus evidential of a design to do the act. Obscure intimation and allusions are often significant ; words of a person, uttered beforehand, indicating a knowledge that an event is about to occur or an act to happen, tend to show a design to do it or to coöperate in it, so far as it was not definitely expected or foreknown by others, because

¹ Adapted from the same author's *Treatise on Evidence* (1905, Vol. I, §§ 237, 238).

in that case the knowledge could be possessed only by the one planning it or privy to the plan; and the probative value of such evidence would vary with the particularity and exclusiveness of the foreknowledge thus indicated.

Explicit threats to do injury, and other express declarations of a design or plan, have of course probative value, but are rather to be classed as testimonial evidence.

Note that we are here not yet concerned with the use of Design or Plan as evidence of the Doing of an Act (*post*, No. 121), but only with conduct as circumstantial evidence that a Design or Plan existed.

40. ALEXANDER M. BURRILL. *A Treatise on Circumstantial Evidence*. (1868. p. 545.)

Infirmative Hypotheses explaining away the Evidence of an Intention. . . .

2. In regard to *predictions* of approaching mischief to an individual who is afterwards found murdered, it may have been the fact that the accused was really speaking the conviction of his own mind, and without any criminal intention. And it has been well remarked that idle prophecies of death are quite as frequently the offspring of superstition, as of premeditated assassination.

3. *Expressions of ill will. . . .* Supposing them to have been actually uttered as proved, they may have been uttered on some sudden provocation, or in the extremity of momentary passion, or during a state of intoxication, without any real, settled, and abiding feeling of malice against the subject of them.

4. *Declarations of intention. . . .* It does not necessarily follow, because a man has avowed an intention to commit a crime, that such intention really existed in his mind. The words may have been spoken in mere bravado, or with the view of alarming or annoying the object of them; or, like expressions of illwill, may have been uttered in a moment of passion, or state of intoxication, without any settled evil purpose.

5. *Threats.* The infirmative suppositions applicable to these circumstances are the same with those just enumerated; with the addition of the following. Threats being considered to be either uttered in the presence and hearing of the person threatened, or intended to come to his knowledge, the sole intention may have been to *alarm* and intimidate him. If the accused really intended the mischief avowed and threatened, it is not *reasonable* that he would *make it known* to the object, and thereby naturally put him on his guard against the intended act. . . .

6. *Preparations for crime.* The infirmative suppositions applicable to circumstances of this class comprise the following. . . . The appearances indicative of preparation may have been correctly observed, . . . and yet may have no real connection with the accused, having emanated from no conduct on his part, but having been wholly *fabricated* by the real criminal or some other person; as by conveying into the possession of the accused (so as to become a subject of observation) a poison of the same description as that afterwards used in committing the crime, or perhaps the identical instrument used in committing it. . . . Again, the appearances supposed to be indicative of preparation may be . . . devoid of any real criminal quality whatever. Thus, it may be true not only that the accused had the poison in his possession before the crime, but that he had it knowingly, having actually procured it with his own hands. And yet, even in this case, the important psychological fact of *intention* may be wholly wanting.

41. THE CASE OF THE *DRYAD*. (ARTHUR GRIFFITHS. *Mysteries of Police and Crime*. 1898. Vol. I, p. 389.)

Frauds upon underwriters and marine insurance officers cannot be said to have ceased to this day. A story of the sea that would serve as the foundation of an exciting sea romance is to be found in the loss of the brig *Dryad*, in 1840. The plot was cleverly laid, and proved perfectly successful for a time. The ship was lost, the insurances paid; the delinquents — two brothers named Wallace, one a merchant, the other a sea captain — might have enjoyed their ill-gotten gains to the end, but for the inconvenient return of some of the crew. Then suspicions that had been only vague became certainty, and one brother, Patrick Wallace, was forthwith arrested. The other, Michael, who had been living in the Commercial Road, absconded, abandoning his house and furniture. He was traced, in due course, to Lancaster, where he was taken. . . .

The brothers had set about their fraud with all the skill of old hands. Michael purchased the preponderating share in the brig *Dryad* — three fourths, in fact, £1600 in all — and had expended another £600 making her “a first-class ship.” Patrick Wallace took the part of securing a complaisant shipmaster, and found him in Edmund Loose, who was appointed to the *Dryad* with the clear understanding that he should lose her somewhere, somehow, the sooner the better. While these essential preliminaries were being settled, Michael Wallace sought out a merchant to ship a cargo, and the Messrs. Zulueta chartered the *Dryad* to carry goods to the value of £300 to Santa Cruz, in the West Indies. Heavy insurances were next effected on the ship and the freight. The owners got a policy for £2200 from the Marine Insurance on the first, and £300 on the latter. But the Wallaces insured the *Dryad* and her cargo further in other offices,

and these policies standing in their names amounted to £6617, a sum far exceeding their actual holding in the ship and what she carried. The chief testimony against the Wallaces was that of the mate of the *Dryad*, who escaped the shipwreck, and who described the whole proceeding. He described the lading of the ship at Liverpool, and how, when Messrs. Zulueta's goods were all on board, quite one third of the hold remained unfilled. Michael Wallace was to have shipped a consignment of flannels, cloths, beef, pork, butter, and earthenware, but never did so, although Captain Loose had signed bills of lading as having received them. A suspicious circumstance was the insufficient quantity of provisions sent for the crew. It was usual to send enough for both outward and homeward voyages, but barely enough for the first was provided. The ship was also badly found. There was no proper log-line on board; the pump was never made to suck; the longboat was fitted with tackle, and ready to launch at a moment's notice. Nothing happened, as the weather continued “set fair,” but they steered a strange course, northward, deviating from the customary track, and first sighted land at Virgin Gorda, and, holding on, ran close to the breakers off Anagada, both of them rocky reefs on the outer fringe of the West Indies. The captain was called up from below, while the mate put the ship's head about. But the captain, coming on deck, seized the helm and ran her straight for the breakers. Now the crew interposed, swearing they did not mean to lose their lives for the captain's pleasure, whereupon he left the wheel, and one of the crew raking it, put the ship's head round. Two days the course was between the Silver Keys and the north of St. Domingo, but so much

too near the former, which are dangerous rocks, that the *Dryad* struck upon one of them, but again she escaped, this time with the loss of her rudder. They then coasted along the coast of St. Domingo, close in shore, and after passing Cape Hayti struck on a reef at Cape Cruz. She might have been got off, for she was making no water, but no efforts were made. The

crew with the captain deserted her, but not before one of them had detected a large hole under her stern which could not have been made by a rock, but was, no doubt, the captain's work from one of the state-rooms. He was never brought to trial, however, for he died before proceedings were taken.

Both the Wallaces were found guilty and sentenced for life.

42. THE CHICAGO ANARCHISTS' CASE. (W. WILLS. *Circumstantial Evidence*. Amer. ed. 1905, p. 154.)

In the Chicago Criminal Court, eight anarchists were found guilty of murder, seven of them being condemned to death. [The judgment was affirmed in 122 Ill. 1.] The seven were August Spies, Michael Schwab, Samuel Fielden, Albert R. Parsons, Adolph Fischer, George Engel, and Louis Lingg. The other, condemned to fifteen years' imprisonment, was Oscar W. Neebe.

On May 1, 1866, many workmen in Chicago struck to obtain a reduction of their working day to eight hours. There was great excitement, and many meetings and speeches. On the 4th of May, such a meeting was held at the Haymarket on Randolph St., in Chicago. This meeting was addressed by several of the defendants, and during the address of Spies a charge was made on the crowd by 180 policemen. Bombs were thrown and guns fired at the policemen, and six policemen were killed and six wounded. The defendants were tried for the murder of one of these policemen, Michael J. Degan.

The *corpus delicti* was established by undisputed evidence. Degan was killed by a bomb; of that there was no doubt. It seemed equally well established that not one of the defendants threw the bomb, but they were charged as accessories.

It was shown that they were all members of several anarchistic societies, particularly one known as

the International Arbeiter Association, often called the "Internationals" and the "I. A. A." This association was divided into groups, of which there were about eighty in the United States. Certain members of each group were armed and drilled regularly. The most proficient of these armed groups, including the defendants, were also members of a more exclusive organization known as the "Lehr und Wehr Verein." Each member had a Springfield rifle and other weapons, and each was known by number only. The object of these societies was the destruction of organized society and the right of private property. The members openly and secretly advocated the destruction of property, the murder of officers of the law and of property owners, and the general use of deadly weapons, dynamite, bombs, and other explosives.

The group of defendants published three incendiary newspapers, — *The Arbeiter Zeitung* in German, published by Spies, Schwab, Fischer, and Neebe; *The Alarm* in English, published by Parsons and Fielden; and a still more inflammable sheet called *The Anarchist*, published by Engel. These papers published the signals by which the anarchists were called together at various times, the signal for the meeting of May 4th being "Ruhe." They constantly advocated social revolution and war upon the police and the militia.

Their articles, written by the defendants, contained hundreds of expressions like the following: "Daggers and revolvers are easily to be gotten, hand-grenades are cheaply to be produced; explosives too can be obtained." "Workingmen, arm yourselves." "We wonder whether the workingmen will at last supply themselves with weapons, dynamite, and prussic acid." "If we do not bestir ourselves for a bloody revolution, we cannot leave anything to our children but poverty and slavery." "One man armed with a dynamite bomb is equal to one regiment of militia." "Dynamite is the emancipator." "Assassination will remove the evil from the face of the earth." Articles were published on "How to use dynamite properly," "Manufacturing Bombs," "Exercise in Arms," and extracts were published from the book of Herr Most, giving detailed instructions in the manufacture and use of bombs and other weapons. In many public speeches the defendants had advocated the killing of the police and the militia, using the same arguments and the same language as in their written editorials. The date for beginning the "social revolution" was May 1, 1886, for the reason that various labor unions were to strike at that time for the eight-hour day. These defendants did not approve of the eight-hour agitation, except as a means that they could use to bring about total destruction of society. They expected the discontent and want accompanying the strike to drive many workmen to the ranks of the Internationals. The defendants urged all to procure arms for the successful resistance of the authorities during the continuance of the strike. They even made arrangements to purchase guns in large quantities.

In the meantime they had all been experimenting in the manufacture and explosion of bombs. Particularly the defendant Lingg had been

so employed. It became material to show that the bomb with which Policeman Degan was killed had been manufactured by Lingg. To this end it was proved first that the bomb was round. Several witnesses who saw it thrown so described it, and moreover, it was not of the material of which ordinary gas-pipe bombs are made. The manufacture of round bombs requires greater skill and greater secrecy. Lingg was shown to have manufactured such round bombs in large numbers. It was also shown that a basketful of his bombs had been carried to the Haymarket meeting. In the next place, the bomb was exploded by means of a fuse. The bombs that Lingg had constructed were all made of two semiglobular shells fastened together, filled with dynamite, and fired by means of a fuse passed through a hole bored for the purpose and attached to a fulminating cap. Further, the pieces of the bomb taken from Degan's body were of the same chemical composition as the bombs made by Lingg. They were composed of tin and lead, with traces of antimony, iron, and zinc. There is no commercial substance containing all these ingredients. In Lingg's bombs the tin had been added to the lead to procure sufficient resistance for explosion.

The bomb that exploded had on it a small iron nut, which was extracted from the body of a bystander. This indicated that the two semiglobular halves of the bomb had been fastened together with a bolt. Practically all of the bombs made by Lingg, and later discovered, were made of the two semiglobular halves, bolted together, and this nut taken from the body of the bystander exactly fitted those bolts. Lingg himself had been seen making such bombs, with a handkerchief over his face to prevent the inhalation of gas. He had bought dynamite. A poisonous gas exhales from dynamite. The con-

clusion follows that he put dynamite in the bombs that he was seen to make.

In Lingg's room, after the murder, were found various articles, among them the following: a cold chisel, a file, shells, loaded cartridges, sheets of lead, bolts, two empty gas-pipe bombs and two loaded with dynamite, a rifle, a round bomb loaded with dynamite, a piece of block tin, a piece of candlestick composed of tin, lead, antimony, and zinc, fuse of various lengths, and fulminating caps. He had every ingredient necessary for the making of bombs like the one that killed Degan. Differences in the exact amounts of these ingredients in the different bombs would be accounted for by the fact that he made each semi-globe separately with a small ladle over the kitchen stove, casting each in a small clay mold made by himself.

Lingg's purpose in making the bombs is to be found from the purposes for which the International Arbeiter Association existed. These have been before stated, and were made apparent from the publications and speeches of the other defendants. There was evidence of a distinct plan on the part of the defendants to attack the police of

the whole city on the night in question. Members of the Association helped themselves to bombs brought by Lingg to the rendezvous, and were to make separate attacks upon the police stations, gradually concentrating to fight in the center of the city. This plan had to be changed because the police were concentrated near the neighborhood of the Haymarket.

There was a vast array of evidence of the foregoing sorts, and the defendants were convicted under a statute of Illinois making accessories punishable as principals. The Court found that Degan's death was directly brought about by the conspiracies and plans of the defendants and other "Internationals." The bombs were made and obtained in pursuance of the plan. The meeting was called at the Haymarket on the appointed evening. That day the signal "Ruhe" was printed, to begin the revolution. In pursuance of the plan, and varying from it only as was made necessary by the location of the police, a bomb was first hurled at them and then the "Internationals" opened fire with guns. The jury were justified in believing that the bomb was thrown either by a member of the conspiracy or by an agent employed to throw it.

43. MADAME LAFARGE'S CASE. (ARTHUR GRIFFITHS. *Mysteries of Police and Crime*. 1898. Vol. I, p. 193.)

One of the greatest poisoning trials on record in any country is that of Madame Lafarge, and its interest is undying, for to this day the case is surrounded in mystery. Although the guilt of the accused was proved to the satisfaction of the jury at the time of the trial, strong doubts were then entertained, and still possess acute legal minds, as to the justice of her conviction. . . .

In the month of January, 1840, an iron-master, Lafarge, residing at Glandier, in the Limousin, died suddenly of an unknown malady. His family, friends, and immediate

neighbors at once accused his wife of having poisoned him. This wife differed greatly in breeding and disposition from the deceased. Marie Fortunée Capelle was the daughter of a French artillery colonel, who had served in Napoleon's Guard. She was well connected, her grandmother having been a fellow pupil of the Duchess of Orléans under Madame de Genlis; her aunts were well married, one to a Prussian diplomat, the other to M. Garat, the well-known general secretary of the Bank of France. She had been delicately nurtured; her father

held good military commands, and was intimate with the best people about, many of them nobles of the First Empire, and the child was petted by the Duchess of Dalmatia (Madame Soult), the Princess of Echmuhl (Madame Ney), Madame de Cambacères, and so forth. Colonel Capelle died early, and Marie's mother, having married again, also died. Marie was left to the care of distant relations; she had a small fortune of her own, which was applied to her education, and she was sent to one of the best schools in Paris. . . . Marie grew up distinguished looking, if not absolutely pretty; tall, slim, with dead-white complexion, jet-black hair worn in straight shining plaits, fine dark eyes, and a sweet but somewhat sad smile. These are the chief features of contemporary portraits.

To marry her was now the wish of her people, and she was willing enough to become independent. Some say that a suitor was sought through the matrimonial agents, others deny it positively. In any case, a proposal came from a certain Charles Pouch Lafarge of Glandier, a man of decent family but inferior to the Capelles, not much to look at, about thirty, and supposed to be prosperous in his business. The marriage was hastily arranged, and as quickly solemnized — in no more than five days.

Lafarge drew a rosy picture of his house: a large mansion in a wide park, with beautiful views, where all were eager to welcome the bride and make her happy. As they traveled thither the scales fell quickly from Marie's eyes. Her new husband changed in tone; from beseeching he became rudely dictatorial, and he seems to have soon wounded the delicate susceptibilities of his wife. The climax was reached on arrival at Glandier, a dirty, squalid place. Threading its dark, narrow streets, they reached the mansion — only a poor place, after all, surrounded with smoking

chimneys: a cold, damp, dark house, dull without, bare within. The shock was terrible, and Madame Lafarge declared she had been cruelly deceived. Life in such surroundings, tied to such a man, seemed utterly impossible. She fled to her own room, and there indicted a strange letter to her husband, a letter that was the starting point of suspicion against her, and which she afterwards explained away as merely a first mad outburst of disappointment and despair. Her object was to get free at all costs from this hateful and unbearable marriage.

This letter, dated August 25, 1839, began thus: "Charles, — I am about to implore pardon on my knees. I have betrayed you culpably. I love not you, but another. . . ." And it continued in the same tone for several sheets. Then she implored her husband to release her and let her go that very evening. "Get two horses ready, I will ride to Bordeaux and then take ship to Smyrna. I will leave you all my possessions. May God turn them to your advantage, you deserve it. As for me, I will live by my own exertions. Let no one know that I ever existed. . . . If this does not satisfy you, I will take arsenic, *I have some . . .* spare me, be the guardian angel of a poor orphan girl, or, if you choose, slay me, and say I have killed myself. Marie."

This strange effusion was read with consternation not only by Lafarge, but by his mother, his sister, and her husband. A stormy scene followed between Lafarge and his wife, but he won her over at length. She withdrew her letter, declaring that she did not mean what she wrote, and that she would do her best to make him happy.

"I have accepted my position," she wrote to M. Garat, "although it is difficult. But with a little strength of mind, with patience, and my husband's love, I may grow

contented. Charles adores me and I cannot but be touched by the caresses lavished upon me." To another she wrote that she struggled hard to be satisfied with her life. Her husband under a rough shell possessed a noble heart; her mother-in-law and sister-in-law overwhelmed her with attentions.

Now she gradually settled down into domesticity, and busied herself with household affairs. M. Lafarge made no secret of his wish to employ part of his wife's fortune in developing his works. He had come upon an important discovery in iron smelting, and only needed capital to make it highly profitable. His wife was so persuaded of the value of this invention that she lent him money, and used her influence with her relatives to secure a loan for him in addition. Husband and wife now made wills whereby they bequeathed their separate estates to each other. Lafarge, however, made a second will, almost immediately, in favor of his mother and sister, an underhand proceeding, of which his wife was not told. Then he started for Paris, to secure a patent for his new invention, taking with him a general power of attorney to raise money on his wife's property. During their separation many affectionate letters passed between them.

The first attempt to poison, according to the prosecution, was made at the time of this visit to Paris. Madame Lafarge conceived the tender idea of her having her portrait painted, and sending it to console her absent spouse. At the same time she asked her mother-in-law to make some small cakes to accompany the picture. They were made and sent, with a letter, written by the mother, at Marie Lafarge's request, begging Lafarge to eat *one* of the cakes at a particular hour on a particular day. She would eat one also at Glandier at the same moment, and thus a mysterious affinity might be set

up between them. A great deal turned on this incident. The case containing the picture and the rest was dispatched on December 16th, by diligence, and reached Paris on the 18th. But on opening the box, one large cake was found, not several small ones. How and when had the change been effected? The prosecution declared it was Marie's doing. The box had undoubtedly been tampered with; it left Glandier, or was supposed to leave, fastened down with small screws. On reaching Paris it was secured with long nails, and the articles inside were not placed as they had been on departure. But the object of the change was evidently evil. For now Lafarge tore off a corner of the large cake, ate it, and the same night was seized with violent convulsions. It was presumably a poisoned cake, although the fact was never verified, but Marie Lafarge was held responsible for it, and eventually charged with an attempt to murder her husband.

In support of this grave charge it was found that on the 12th of December, two days before the box left, she had purchased a quantity of arsenic from a chemist in the neighboring town. Her letter asking for it was produced at the trial, and it is worth reproducing. "Sir," she wrote, "I am overrun with rats. I have tried nux vomica quite without effect. Will you, and can you, trust me with a little arsenic? You may count upon my being most careful, and I shall only use it in a linen closet." At the same time she asked for other harmless drugs. Further suspicious circumstances were adduced against her. It was urged that after the case had been dispatched to Paris she was strangely agitated, her excitement increasing on the arrival of news that her husband was taken ill, that she expressed the gravest fears of a bad ending, and took it almost for granted that he must die.

Yet, as the defense presently

showed, there were points also in her favor. Would Marie have made her mother-in-law write referring to the small cakes, one of which the son was to eat, if she knew that no small cakes but one large one would be found within? How could she have substituted the large for the small? There was as much evidence to show that she could not have effected the exchange as that she had done so. Might not some one else have made the change? (Here was the first importation of another possible agency in the murder, which never seems to have been investigated at the time, but to which I shall return presently, to explain how Marie Lafarge may have borne the brunt of another person's crime.) Again, if she wanted thus to poison her husband, it would have been at the risk of injuring her favorite sister also. For this sister lived in Paris, and Lafarge had written that she often called to see him. She might then have been present when the case was opened, and might have been poisoned too.

Lafarge so far recovered that he was able to return to Glandier, which he reached on the 5th of January, 1840. That same day Madame Lafarge wrote to the same chemist's for more arsenic. It was a curious letter, and certainly calculated to prejudice people against her. She told the chemist that her servants had made the first lot into a clever paste which her doctor had seen, and had given her a prescription for it; she said this "so as to quiet the chemist's conscience, and lest he should think she meant to poison the whole province of Limoges." She also informed the chemist that her husband was indisposed, but that this same doctor attributed it to the shaking of the journey, and that with rest he would soon be better. But he got worse, rapidly worse. His symptoms were alarming, and pointed undoubtedly to arsenical

poisoning, judged by our modern knowledge.

Madame Lafarge, senior, now became strongly suspicious of her daughter-in-law, and she insisted on remaining always by her son's bedside. Marie opposed this, and wished to be her husband's sole nurse, and, according to the prosecution, would have kept every one else from him. She does not seem to have succeeded, for the relatives and servants were constantly in the sick room. Some of the latter were very much on the mother's side, and one, a lady companion, Anna Brun, afterwards deposed that she had seen Marie go to a cupboard and take a white powder from it, which she mixed with the medicine and food given to Lafarge. Madame Lafarge, senior, again, and her daughter, showed the medical attendant a cup of chicken broth on the surface of which white powder was floating. The doctor said it was probably lime from the white-washed wall. The ladies tried the experiment of mixing lime with broth, and did not obtain the same appearance. Yet more, Anna Brun, having seen Marie Lafarge mix powder as before in her husband's drink, heard him cry out, "What have you given me? It burns like fire." "I am not surprised," replied Marie, quietly. "They let you have wine, although you are suffering from inflammation of the stomach."

Yet Marie Lafarge made no mystery of having arsenic. Not only did she speak of it in the early days, but during the illness she received a quantity openly before them all. It was brought her to Lafarge's bedside by one of his clerks, Denis Barbier (of whom more directly), and she put it into her pocket. She told her husband she had it. He had been complaining of the rats that disturbed him overhead, and the arsenic was to kill them. Lafarge took the poison from his wife, handed it over to a maid-

servant, and desired her to use it in a paste as a vermin killer. Here the facts were scarcely against Marie Lafarge.

Matters did not improve, however, and on the 13th Madame Lafarge, senior, sent a special messenger to fetch a new doctor from a more distant town. On their way back to Glandier, this messenger, the above-mentioned Denis Barbier confided to the doctor that he had often bought arsenic for Marie Lafarge, but that she had begged him to say nothing about it. The doctor, Lespinasse, by name, saw the patient, immediately ordered antidotes, while some of the white powder was sent for examination to the chemist who had originally supplied the arsenic. He does not seem to have detected poison, but he (the chemist) replied that nothing more should be given Lafarge unless it had been prepared by a sure hand. On this the mother denounced Marie to the now dying Lafarge as his murderess. The wife, who stood there with white face and streaming eyes, heard the terrible accusation, but made no protest.

From that till his last moments he could not bear the sight of his wife. Once, when she offered him a drink, he motioned, horror stricken, for her to leave him, and she was not present at his death on the 14th of January. A painful scene followed between the mother and Marie by the side of the still warm corpse. High words, upbraidings, threats on the one side, indignant denials on the other. Then Marie's private letters were seized, the lock of her strong box having been forced, and next day, the whole matter having been reported to the officers of the law, a post mortem was ordered, on suspicion of poisoning. "Impossible," cried the doctor, who had regularly attended the deceased. "You must all be wrong. It would be abominable to suspect a crime without more to go upon."

The post mortem was, however,

made, yet with such strange carelessness that the result was valueless. It may be stated at once that the presence of arsenic was never satisfactorily proved. There were several early examinations of the remains, but the experts never fully agreed. Orfila, the most eminent French toxicologist of his day, was called in to correct the first autopsy, and his opinion was accepted as final. He was convinced that there were traces of arsenic in the body. They were, however, infinitesimal; Orfila put it at half a milligram. Raspail, another distinguished French doctor, called it the hundredth part of a milligram, and for that reason declared against Orfila. His conclusion, arrived at long after her conviction, was in favor of the accused. The jury, he maintained, ought not to have found her guilty, because no definite proof was shown of the presence of arsenic in the corpse.

This point was not the only one in the poor woman's favor. Even supposing that Lafarge had been poisoned — which, in truth, is highly probable — the evidence against her was never conclusive, and there were many suspicious circumstances to incriminate another person. This was Denis Barbier, Lafarge's clerk, who lived in the house under a false name, and whose character was decidedly bad. Lafarge was not a man above suspicion himself, and he long used this Barbier to assist him in shady financial transactions — the manufacture of forged bills of exchange which were negotiated for advances. Barbier had conceived a strong dislike to Marie Lafarge from the first; it was he who originated the adverse reports. At the trial he frequently contradicted himself, as when he said at one time he had volunteered the information that he had been buying arsenic for Marie, and at another, a few minutes later, that he only confessed this when pressed. Barbier then was Lafarge's confederate in

forgery; had these frauds been discovered he would have shared Lafarge's fate. It came out that he had been in Paris when Lafarge was there, but secretly. Why? When the illness of the iron-master proved mortal, Barbier was heard to say, "Now I shall be master here!" All through that illness he had access to the sick-room, and he could easily have added the poison to the various drinks and nutriment given to Lafarge. Again, when the possibilities of murder were first discussed, he was suspiciously ready to declare that it was not *he* who gave the poison. Finally, the German jurists, already quoted, wound up their argument against him by saying, "We do not actually accuse Barbier, but had we been the public prosecutors we would rather have formulated charges against him than against Madame Lafarge."

Summing up the whole question, they were of opinion that the case was full of mystery. There were

suspensions that Lafarge had been poisoned, but so vague and uncertain that no conviction was justified. The proofs against the person accused were altogether insufficient. On the other hand, there were many conjectures favorable to her. Moreover, there was the very gravest circumstantial evidence against another person. The verdict should decidedly have been "not proven." . . .

Marie Lafarge was sentenced to hard labor for life, after exposure in the public pillory. The latter was remitted, but she went into the Montpelier prison and remained there many years. Not long after her conviction there was a strong revulsion of feeling, and during her seclusion she received some six thousand letters from outside. . . . At last, having suffered seriously in health, she appealed to Napoleon III, the head of the Second Empire, and obtained a full pardon in 1852.

Boston Transcript, Paris Dispatch of Dec. 10, 1912. An effort to obtain the revision of the trial of Mme. LaFarge, a young and beautiful society woman, who was sentenced to imprisonment for life in 1840 for the murder of her husband by poisoning him with arsenic, is to be made by a powerful committee of scientific men, writers, and politicians which has just been formed. The case of Mme. LaFarge was very similar to that of Mrs. Maybrick. It caused a great sensation at the time. The conviction was due principally to the evidence of the great chemist Matthieu Orfila, who swore to the presence of arsenic in the dead man's body. Another leading scien-

tist of the period, François Raspail, hastened to Tulle, where the trial took place, in order to declare to the jury that Orfila's evidence was insufficient as arsenic was present in all bodies, but he arrived too late.

Raspail's contention is supported to some extent by later experiments carried out by Armand Gautier, and Professor Gabriel Bertrand has just concluded a series of studies in every living organism, and further that the methods hitherto employed to test the presence of arsenic in bodies had had the effect of introducing arsenic into those bodies. Mme. LaFarge died in 1855, two years after she had been pardoned by Napoleon III.

SUBTITLE E: EVIDENCE TO PROVE INTENT

46. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹ The state of mind accompanying a forbidden act is frequently an element material to make the act a crime. The notion of Intent, in crimes, may be also, in a broad sense, that of ultimate purpose or object, but it is regarded simply as a state of mind coexisting with the act, and is of a conglomerate nature peculiar to itself. Thus, when A shoots a pistol whose ball strikes X, A's state of mind as he shot may have been that he was pulling the trigger of a pistol whose ball would (a) strike a tree, (b) strike Z, (c) strike a person, X, who was about to assault A himself. The criminal law tells us whether either of these states of mind is criminal; but it does not need to generalize in one phrase or term the exact nature of all possible criminal states of mind; it merely defines the criminal state of mind essential for each respective crime.

The idea of criminal Intent, then, usually partakes of Knowledge, Plan, Hostility, and the like; its absence is often indicated by the ideas of ignorance, reasonable belief, and the like. So far as evidence of it is concerned, Intent as a separate proposition for proof does not commonly exist. Knowledge, Emotion, and Design, are distinct from each other, and have more or less distinct modes of proof. But so far as Intent is constituted of one or more of these as ingredients, it forms no separate title of proof; for each of the ingredients is to be proved in the way proper to itself.

There is, however, one element in Intent which is distinct from any of those above, and may thus have to be shown by different evidence. This is the element of *deliberateness* or *willfulness*, — the negative of inadvertence, accident. Thus one who incorrectly writes the addition of a column of figures may do so either inadvertently or intentionally; one who knocks over a lamp and sets fire to a house may do so either inadvertently or deliberately. This element is distinct from that of ignorance, or mistake through ignorance (*i.e.* the absence of knowledge). For instance, one who utters a counterfeit bill may have known it to be counterfeit, but may pay it out by inadvertence, having drawn from the wrong part of his pocketbook. So, on the other hand, one who sells tainted milk does not do it by accident, though he is ignorant of its bad quality. In other words, one may lack knowledge and yet act deliberately, or one may have knowledge and yet act inadvertently. Thus, this distinct element in criminal Intent consists not alone in the voluntary movement of the muscles (*i.e.* in action), nor yet in a knowledge of the nature of an act, but in the combination of the two, — *the specific will to act, i.e.* the volition exercised with conscious reference to

¹ Adapted from the same author's *Treatise on Evidence* (1905, Vol. I, §§ 242, 301).

whatever knowledge the actor has on the subject of the act. We do not necessarily show this in showing Knowledge; and, conversely, we may find Knowledge conceded and still have to show criminal knowledge. For instance, on the one hand, a person might know arsenic to be poisonous, and yet might administer it inadvertently to another; so that independently of showing his past knowledge of its nature, it might also be necessary to negative his inadvertence. On the other hand, a person might deliberately pull the trigger of a firearm though ignorant that it was loaded; and thus the deliberateness of the act — *i.e.* the combination of voluntary action with all the knowledge which the person had — would be unquestioned, and the further proof required would be that peculiar to showing knowledge of the particular firearm's contents. There may always thus be a residuum, apart from Knowledge, which remains to be proved.

This residuum, or Intent, the element of deliberateness, the negative of inadvertence or accident, may of course be evidenced by the surrounding circumstances and the conduct, as other mental states are. It may also be evidenced by Design; for, *e.g.*, one who has planned to kill another is very unlikely to have acted inadvertently in shooting at him. It may also be evidenced by Knowledge, for one who knows, *e.g.*, that arsenic is poisonous is less likely than otherwise to administer it inadvertently. It may also be evidenced by Emotion; for one who is angry with another is less likely than otherwise to strike him inadvertently. All these elements, independently useful and provable as bearing on the doing of the act, help also to throw light on the intent accompanying the act.

Other Similar Acts. But there is one peculiar mode of evidencing this deliberateness which stands by itself in the sense that it may have no bearing distinctively on a previous Design or on a previous Knowledge, and yet may help to throw light on Intent; namely, *other similar acts*. Such acts may be used as evidencing either of those three mental states. Hence it is necessary to discriminate, and to examine here the probative value of similar offenses or acts (*i.e.* similar to the one charged) offered for the purpose of showing such a Knowledge, Intent, or Design. The conditions may differ under which the same conduct will evidence one or another of these probanda.

(a) *Theory of evidencing Knowledge.* In resorting to former offenses or other similar acts to show Knowledge, it is sufficient to invoke the general principles of proving Knowledge. It has been seen (*ante*, No. 30) that this mode of proof rests on the following process of thought. When fact X is used to show a person's knowledge of fact A, it is assumed (a) that through fact X there probably was received an impression by the person; and (b) that this impression would probably result in notice or warning of fact A. Thus, (a) a prior injury to an employee by a machine would probably have come to the employer's notice in some way, and (b) the notice of the accident would probably reveal to him the defect in the machine. These two elements may not both be doubtful in a given case, but they are always impliedly present if the inference is to have any validity. Apply this to the class of cases we are now concerned with. Suppose A's knowledge of the poisonous nature of a substance X is to be shown; suppose the fact offered that he once gave it to a sick dog and that the dog died; if we are to base an inference of probable knowledge upon this, it is because we believe it prob-

able (a) that the dog's death came to his notice, and (b) that the fact of the death would suggest to him that it was the substance X and not the illness that caused the dog's death. Again, suppose A's knowledge of the counterfeit nature of a certain silver dollar is to be shown; suppose the fact offered that he twice passed counterfeit ten-dollar bank notes; if we are to base on this an inference of probable knowledge, it is because we believe it probable (a) that in the course of using the bank notes, at one time or another up to their final disposal, some one probably doubted to him their genuineness and (b) that a doubt as to the genuineness of the bank notes would probably suggest a doubt as to the genuineness of the silver dollar. Again, if A's knowledge of the stolen character of a bar of iron is to be shown, and the fact is offered that he has also received and possessed a stolen bicycle, then our inference must assume (a) that A's receipt of the bicycle was under such circumstances as to suggest its vendor or pledgor to be a thief, or as to result in a reclamation by the owner and a warning to the defendant; so that (b) when the bar of iron was offered to A, by the same or another vendor or pledgor, the circumstances were such that the former transaction would naturally suggest that this bar of iron also was stolen.

Such, then, is the strict and legitimate scope of evidence of other similar acts to show Knowledge. The process of thought is: The other act must probably have resulted in some sort of warning or knowledge; this warning or knowledge must probably have led to the knowledge in question.

(b) *Theory of evidencing Intent.* To prove Intent, there is employed an entirely different process of thought. The argument here is purely from the point of view of the doctrine of chances, — the instinctive recognition of that logical process which eliminates the element of innocent intent by multiplying instances of the same result until it is perceived that this element cannot explain them all. Without formulating any accurate test, and without attempting by numerous instances to secure absolute certainty of inference, the mind applies this rough and instinctive process of reasoning. Thus, if A while hunting with B hears the bullet from B's gun whistling past his head, he is willing to accept B's bad aim or B's accidental tripping as a conceivable explanation; but if shortly afterwards the same thing happens again, and if on the third occasion A receives B's bullet in his body, the immediate inference (*i.e.* as a probability, perhaps not a certainty) is that B shot at A deliberately; because the chances of an inadvertent shooting on three successive similar occasions are extremely small; or (to put it in another way) because inadvertence or accident is only an abnormal or occasional explanation for the discharge of a gun at a given object, and therefore the recurrence of a similar result (*i.e.* discharge towards the same object, A) excludes the fair possibility of such an abnormal cause and points out the cause as probably a more natural and usual one, *i.e.* a deliberate discharge at A. In short, similar results do not usually occur through abnormal causes; and the recurrence of a similar result (here in the shape of an unlawful act) tends (increasingly with each instance) to negative accident or inadvertence or self-defense or good faith or other innocent mental state, and tends to establish (provisionally, at least, though not certainly) the presence of the normal, *i.e.* criminal, intent accompanying such an act; and the force of each additional instance will vary in each kind of offense according to the probability that the act could be repeated, within a limited time and under given

circumstances, with an innocent intent. The general canon of logical inference already examined (*ante*, No. 2, § 3) is here applied and illustrated.

Yet, in order to satisfy this principle, it is at least necessary that prior acts should be *similar*. Since it is the improbability of a like result being repeated by mere chance that carries probative weight, the essence of this probative effect is the similarity of the instance. Suppose the blowing up of an American warship in Havana Harbor to be in question; the blowing up of various ships of various other nations in the preceding fifty years would have no significance as to the accidental nature of the occurrence (except to show that such an accident is possible); the blowing up of an American warship in the preceding year in Algiers would have scarcely more significance; but the blowing up of an American warship in the same year in Cadiz or in the same harbor of Havana would have striking significance. So, where the intent of an erroneous addition in a bookkeeper's accounts is in issue, the erroneous addition of a bill rendered to a former employer ten years before would have no significance, because it is still within the limits of ordinary casual error that such things should occur at intervals; but several other erroneous additions in the bookkeeper's own favor in the same year and the same book of accounts go to exclude the explanation of casual error, and leave deliberate intent as the more probable explanation.

(c) *Theory of evidencing Design or System.* The object here is not merely to negative an innocent Intent at the time of the act charged, but to prove a preëxisting Design, system, plan, or scheme, directed forwards to the doing of that act. In the former case (of Intent) the attempt is merely to negative the innocent state of mind at the time of the act charged; in the present case the effort is to establish a definite prior Design or system which included the doing of the act charged as a part of its consummation. In the former case, the result is to give a complexion to a conceded act, and ends with that; in the present case, the result is to show (by probability) a positive design which in its turn is to evidence (by probability) the doing of the act designed. The added element, then, must be, not merely a similarity in the results, but *such a concurrence of common features that the various acts are naturally to be explained as caused by a general plan of which they are the individual manifestations.* Thus, where the act of passing counterfeit money is conceded, and the intent alone is in issue, the fact of two previous utterings in the same month might well tend to negative innocent intent; but where the very act of uttering is disputed — as, where the defendant claims that his identity has been mistaken — and the object is to show that he had a general system or plan of working off a quantity of counterfeit money and did carry it out in this instance, the fact of two previous utterings may be in itself of trifling and inadequate significance. So, on a charge of assault with intent to rape, where the intent alone is disputed, a prior assault on the previous day upon the same woman, or even upon another member of her family, might have probative value; but if the assault itself is disputed, and the defendant attempts, for example, to show an *alibi*, the same facts might be of little or no value, and it might be necessary to go further and to show (for example) that the defendant on the same day, with a confederate guarding the house, assaulted other women in the same family, who escaped, leaving the complainant as the only woman accessible to him for his purpose.

It will be seen that the difference between requiring *similarity*, for acts

negating innocent Intent, and requiring *common features indicating common design*, for acts showing Design, is a difference of degree rather than of kind; for to be similar involves having common features, and to have common features is merely to have a high degree of similarity. Nevertheless the distinction is a real one. The clew to the difference is best gained by remembering that in the one class of cases the act charged is assumed as done, and the mind asks only for something that will negative innocent intent; while in the other the very act is the object of proof, and is desired to be inferred from a plan or system.

47. HODGES' AND PROBIN'S CASE. (CAMDEN PELHAM. *The Chronicles of Crime*. ed. 1891. Vol. I, p. 351.)

The trick of cross-dropping has become so notorious of late years, that any description of the mode in which it was practiced is almost unnecessary. As, however, this is the first case of the kind with which we have met in the course of our search in the records of crime, we shall give it a place in our calendar.

The dupe, in this instance, was William Headley, an ironmonger at Cambridge, who, on the trial of these robbers, deposed that on the 7th of July, 1796, he was in town, going from Shoelane to the Angel Inn, St. Clement's, to take a place on the outside of the coach to go into Wiltshire: when he met Hodges, who was a stranger in Butcher row, and left him to take his place. He went on to Clare Market, where Hodges overtook him, and they walked together through Portugal street. While in that street Hodges suddenly stopped, and clapping his cane on a parcel which was lying on the ground, said that he had a "finding." He picked up the parcel, and opened the outer covering, and the witness saw in it something like a red pocketbook. He inquired what it was? but the prisoner refused to show him in the street, and they, in consequence, went into a public house in order to open it. Having called for some liquor, the prisoner opened the parcel, and produced from it what looked like a diamond cross, and a receipt in the following terms: "London, 20th June, 1796. Received of John

King, Esq., the sum of three hundred and twenty pounds, for one brilliant diamond cross, by me, William Smith." The prisoner seemed much alarmed and confused on seeing this, but the witness having read the receipt, suggested that the parcel should be taken to Mr. Smith. This, however, was opposed by Hodges, who asked whether they had not better inquire of the gentleman sitting by (the prisoner Probin) what his opinion was? This was assented to, and upon his being addressed, he suggested that Hodges ought to give the witness a present, as having been by when the cross was found, and that he should keep it. The cross was then taken out and examined, and Hodges said that he did not mind giving the witness something, but he must go to his banker's first, and get some drafts changed. He then went out, leaving the cross with the witness and Probin, but returned, saying that his banker was out, and could not be seen until four o'clock, and a meeting at that hour was eventually appointed to take place at the Angel Inn, St. Clement's. Each party then gave his name. Hodges said that he came from Worcester, and was a hop merchant; and Probin said that his name was William Jones, and that he lived at No. 7, Charing Cross. A discussion now took place, to whom the care of the cross should be intrusted; and Probin suggested, that the witness perhaps would be better satis-

fied if it were left in his hands, and that if he deposited something, he might carry it away until four o'clock. He asked what would be required, and they said that he ought to leave one hundred pounds at least. He then produced a Bank bill, payable on demand, for that amount from his stocking, where he had concealed it, and handing it to Hodges, he said that that would do. The witness then went away, but subsequently showing the cross to a friend, he found that it was quite valueless. Information was, in consequence, given at Bow

street of the robbery, and both prisoners were apprehended in the course of the ensuing day, money to the amount of nearly fifty pounds being found on each. It afterwards turned out that the prisoner Hodges changed Mr. Headley's Bank bill almost immediately after he had received it. In his possession was found a second cross, precisely similar to that palmed off upon the prosecutor.

The prisoners being found guilty, were sentenced to be transported for seven years.

48. CAPTAIN KIDD'S CASE. *Military Trials.* 1866. p. 21.)

Captain William Kidd the hero of, as it may be called, this political and nautical romance, was born in the town of Greenock, in Scotland, and bred up for a seaman's life. Having quitted his native country, he resided at New York, where he became owner of a small vessel, with which he traded among the pirates, and thus obtained a thorough knowledge of their haunts, and could give a better account of them than any other person whatever. He was a man not particularly remarkable for courage, but very avaricious. He could never resist the tempting influence of the rapid profits made by pirates, and to this was owing his connection with them. While in their company, he used to converse and act as they did; yet at other times he would make singular professions of honesty, and intimate how easy a matter it would be to extirpate sea robbers, and prevent their future depredations. His frequent remarks on this subject engaged the notice of several considerable planters in the state of New York, who, forming a more favorable opinion of him than his true character would warrant, procured him the patronage with which he was afterwards honored.

(P. BURKE. *Celebrated Naval and*

For a series of years complaints had been made of the piracies committed in the West Indies, which had been greatly encouraged by some of the inhabitants of North America, on account of the advantage from purchasing effects thus fraudulently obtained. This coming to the knowledge of King William III, he, in the year 1695, bestowed the government of New England and New York on his devoted follower, Richard Coote, Earl of Bellamont. . . . A royal commission in the usual form was granted to Captain Kidd, to take and seize pirates, and bring them to justice; but though a second commission was added, there was, beyond the general direction not to molest the king's friends, and to bring ships taken to legal trial, no special clause or proviso to restrain his conduct, or regulate the mode of his proceeding. . . . A ship was purchased and equipped in the port of London; it received the name, which this affair made so known, of the *Adventure Galley*. In this vessel Captain Kidd crossed the Atlantic, and then towards the close of the year 1695 sailed from New York and made prize of a French ship. . . . At the expiration of five weeks fell upon and seized

the *Quedagh Merchant*, a ship of four hundred tons burthen, the master of which was an Englishman, named Wright, who had two Dutch mates on board, and a French gunner; but the crew consisted of Moors, natives of Africa, and were about ninety in number. . . . Kidd, therefore, on his arrival, was seized by order of his lordship, when all he had to urge in his defense was, that he thought the *Quedagh Merchant* a lawful prize, as she was manned with Moors, though there was no kind of proof that this vessel had committed any act of piracy. . . .

The trials of Kidd and his companions came on at the Old Bailey in May, 1701. The proceedings were very lengthy, and consisted of several distinct trials; the first was for murder against Kidd alone, the other trials were for various acts of piracy committed by him and different members of his crew. . .

On Kidd's urging that he acted under a royal commission, Mr. Justice POWELL properly observed to the jury, "I understand that he had a commission; therefore if any one has a commission, and he acts according to it, he is not a pirate; but if he takes a commission for a color, that he may be a pirate, it will be bad indeed: and therefore, if the crown can prove that he was a pirate all along, this will be a great evidence against him." . . .

Lord Chief Baron WARD: "Gentlemen of the jury, — The prisoners at the bar, William Kidd, Nicholas Churchill, James Howe, Robert Lamley, William Jenkins, Gabriel Loff, Hugh Parrot, Richard Barlicorn, Abel Owens, and Darby Mullins, in number ten, stand all here indicted for the crime of piracy, charged to be committed by them. And the instance of the crime is for feloniously and piratically seizing and taking the ship called the *Quedagh Merchant*, with the apparel and tackling thereof, to the value of 400 (pounds), and divers goods

mentioned in the indictment to the value of 4500 (pounds), the goods of several persons unknown, from the mariners of the said ship, and this at high sea within the jurisdiction of the Court of Admiralty, about ten leagues from Cutsheen in the East Indies, the 30th of January, 1697, and in the eighth year of his Majesty's reign. . . . To make good this accusation, the king's counsel have produced their evidence, and two witnesses have been examined in this case; each of them were in the ship which took the *Quedagh Merchant*, and very well acquainted with all the proceedings; that is, Robert Brandinham and Joseph Palmer. The first has given you an historical account of the whole proceedings of Captain Kidd, from his first going out of England in the *Adventure Galley*, to the time of this fact charged on them. They tell you that about May, 1696, the king intrusted this Captain Kidd with two commissions, and they were both read to you. By one of them under the Admiralty seal, he was authorized to set out as a privateer the *Adventure Galley*, and therewith to take and seize the ships and goods belonging to the French king, or his subjects, and such other as were liable to confiscation. And by the other commission, under the broad seal of England, authority was given for the taking of some pirates by name, and all pirates in the several places therein mentioned; but in no sort to offend or molest any of the king's friends or allies, their ships or subjects, by color thereof. And by both commissions command was given to bring all such ships and goods, as should be taken, to legal trials and condemnations. They tell us that this ship set out for Plymouth about May, 1696, and that in their passage they did take a French ship, and they did condemn that ship. Now, gentlemen, you must bear this in your minds, that to make it piracy it

must be the taking piratically and feloniously upon the high sea, within the jurisdiction of the Admiralty of England, the goods of a friend — that is, such as are in amity with the king. Now, you see what way they went to work, and what measures they took. Captain Kidd goes out, and goes to New York; and when he was there he has a project in his head, of setting up articles between himself and the people that were willing to be concerned with him: for now, whether it seems more probable from what followed, that Captain Kidd designed to manage himself according to the measures given him, and the powers of his commissions, or any other way, you must consider: for it is told you, that between one hundred and fifty and one hundred and sixty men came in under these articles, whereof the other prisoners were part, and concerned in them. And as to those articles, the import of them was, that whatever should be taken by these people in their expeditions should be divided into one hundred and sixty parts, whereof Captain Kidd was to have forty shares for his part, and the rest were to have according to the merits of each party, some whole shares, and some half shares.

“Now, after these articles, you perceive what progress they made, and what course they took; they went from one place to another, and used a great deal of severity wherever they came. A design they had to go into the Red Sea, and they had expectations of the Mocca fleet that lay at Mocca, and they sent their spies three times to get intelligence: the two first times they could make no discovery, but the third time they made an effectual discovery that the fleet was ready to sail; and in the meantime Captain Kidd lay there in expectation of this fleet; and as the first witness tells you, Captain Kidd said, he intended to make a voyage out of this fleet.

Well, he had a discovery of this fleet, and they came accordingly; and they tell you, that he and his men did attack one of the ships; but these ships being guarded by two men-of-war, he could make nothing of them; however, he showed what his intention and design was. Could he have proved that what he did was in pursuance of his commissions, it had been something; but what had he to do to make any attack on these ships, the owners and freighters whereof were in amity with the king? This does not appear to be an action suitable to his commissions. After he had done this, he came to land, and there, and afterwards at sea, pursued strange methods, as you have heard. The seeming justification he depends on is his commissions. Now it must be observed how he acted with relation to them, and what irregularities he went by. He came to a place in the Indies, and sent his cooper ashore, and that cooper was killed by the natives; and he uses barbarity, and ties an Indian to a tree, and shoots him to death. Now he went from place to place, and committed hostilities upon several ships, dealing very severely with the people.

“But this being something foreign to the indictment, and not the facts for which the prisoners at the bar are indicted, we are confined to the *Quedagh Merchant*. But what he did before shows his mind and intention not to act by his commissions, which warrant no such things. Gentlemen, you have an account, that he met with this ship, the *Quedagh Merchant*, at sea, and took her; that this ship belonged to people in amity with the king of England; that he seized this ship and divers goods were taken out of her and sold, and the money divided pursuant to the heads contained in those articles set up in New York. The witnesses that speak to that come home to every one of the prisoners; they tell you that the

dividend was made; that Captain Kidd had forty shares of the money, and the rest of the prisoners had their proportions according to the articles, some a whole share, and some a half share of that money. After they had seized the ship, you hear of a certain sort of project, that a Frenchman should come and pretend himself the master, and procure, or pretend to procure a French pass, under a color that these people's ship and goods, who were Moors, should be Frenchmen's ship and goods, or sailed under a French pass, and so justify what he did under the color of his commission from the king. Now, no man knows the mind and intentions of another, but as it may be discovered by his actions. If he would have this to be understood to be his intention, or that it was in reality, that he took this as a French ship, or under a French pass, then

he ought to have had the ship and goods inventoried, and condemned according to law, that he might have had what portion belonged to him, and that the king might have had what belonged to him, as his commissions directed; but here was nothing of that done, but the money and goods which were taken were shared, and you have an account likewise how some of the goods were sold, and the money disposed of; and one witness speaks positively of the distribution of the goods that remained unsold, that they were divided according to the same proportions as the articles mentioned, and every one of the prisoners had his share; there belonged forty shares to Captain Kidd, and shares and half shares to the rest.

"Now, this is the great case that is before you, on which the indictment turns." . . .

49. BRADFORD v. BOYLSTON FIRE AND MARINE INSURANCE COMPANY. (1831. SUPREME JUDICIAL COURT OF MASSACHUSETTS. 11 Pick. 162.)

Assumpsit on a policy of insurance underwritten by the defendants, upon property of the plaintiffs shipped on board a vessel, from a port in England to a port of discharge in the United States; "partial loss to be computed upon each package as if separately insured." The plaintiffs allege in their declaration, that on May 5, 1828, they shipped on board the *Aspasia*, at Liverpool, certain goods, to be conveyed to New York, and that owing to tempests on the voyage the salt water found access to the goods and injured them; and the plaintiffs claimed a partial loss amounting to 33 per cent upon the value of the goods.

At the trial before WILDE, J., it appeared, that the goods alleged to have been damaged consisted of thirty-two bales of point and duffil blankets and that the blankets were manufactured for the plaintiffs

by one Wood, in the kingdom of Great Britain. The plaintiffs offered evidence tending to prove that the blankets were damaged on board, by the perils alleged in their declaration. The defendants contended that the damage arose from some defect in the manufacture of the blankets, or from their having been fraudulently packed by Wood in a wet state, for the purpose of increasing their weight, the blankets having been purchased by the plaintiffs by weight. The defendants offered in evidence two depositions of one Russell, to prove that during the year 1828 he imported into New York certain bales of point and duffil blankets manufactured by Wood, which proved to be damaged, and, in the opinion of Russell, by being packed in a wet state for the purpose of increasing their weight. The defendants also offered the testimony of one Lee, who stated that

in 1828, the firm of which he was a partner, received a consignment of point and duffil blankets from Wood, and also some which they purchased of Wood; that the blankets came in three different vessels, and were all damaged; that the blankets in the inside of the bales were slightly damp and very much spotted, and the outside blankets were perfectly dry; that the damage to the blankets exhibited as part of the *Aspasia's* cargo, was of a similar character, and he would have supposed they were a part of his own; that the damage was of a peculiar kind and not like that produced by salt water. There was evidence in the case tending to show that the damage was caused by sulphuric acid. To the admission of the depositions of Russell and of the testimony of Lee, the plaintiffs objected, on the ground that it was an attempt to prove that Wood had fraudulently damaged the blankets in question, by proving that he had in other cases damaged blankets by packing them in a wet state to increase their weight; which the plaintiffs contended it was not competent for the defendants to do. But the Judge overruled the objection and permitted the evidence to go to the jury. . . .

The jury found a verdict for the defendants, and no inquiry was made or moved for by the plaintiffs' counsel at the time, as to the principles upon which the verdict was founded. The plaintiffs moved for a new trial: 1. Because the depositions of Russell and the testimony of Lee were admitted in evidence. . . . *S. D. Ward*, in support of the motion. . . . *S. Hubbard* and *Cook*, contra. . . .

PUTNAM, J., delivered the opinion of the Court.—The main objection which has been made to the proceedings at the trial, is, that the testimony of Lee and the depositions of Russell ought not to have been received for the defendants. It is contended that the evidence proves that Wood made bad blank-

ets for other persons and that this circumstance has no tendency to prove that he made bad blankets for the plaintiffs; that it is no better than to offer evidence of general bad reputation, when a party should be held to prove the particular fraud. And the case of *Holcombe v. Hewson*, 2 Campb. 391, has been much relied upon, and is the strongest which we have seen for the plaintiffs. In that case *Holcombe* was bound to prove that he had supplied *Hewson* with good beer, and he offered to prove that several other persons who dealt with him while he supplied the defendant, were satisfied with his beer, as being of excellent quality; but Lord ELLENBOROUGH held the evidence to be inadmissible, because he might have dealt well with some, but not well with other customers. This case was properly decided; the evidence offered by the plaintiff was of his own doings and conduct in regard to strangers, from which it was intended to be inferred that his conduct towards the defendant had been similar; that would be clearly a non sequitur.

But in the case at bar the evidence objected to does not arise between the party who furnished the damaged goods and the purchaser, but between strangers to the manufacturer. The evidence comes in collaterally, and is greatly, if not unavoidably, connected with other testimony which is admitted to be material and competent. The point to be proved by the defendants was, that the blankets were injured by some other cause than the perils of the sea. They had a peculiar appearance; they were so singularly spotted and marked, that Lee, who had imported blankets from England, of similar appearance, would have supposed they were the same. This happened in 1828, the same year that the plaintiffs imported those now in question. It happened also, that a great many bales of blankets exactly resembling the

plaintiffs' were imported that year from England into New York. Now it is conceded that it would be perfectly competent to compare the plaintiffs' blankets with the other damaged blankets, in order to satisfy the jury that it was not the damage of the sea which operated so peculiarly and injuriously. It is not contended but that it would be proper to prove that they all came from England; but that evidence would be much less satisfactory than to trace them to one manufactory in England. If you may properly go to the manufactory, why not to the name of the manufacturer? It is not easy to draw the line. They are marked and injured as no other blankets were, which have been imported. They may have been injured by persons at Wood's manufactory, without his knowledge, and so without any intention of fraud on his part; it may have been done by some enemy, with a view to prejudice Wood in his business. In the case of *Holcombe v.*

Hewson, before cited, Lord ELLENBOROUGH said, "let the plaintiff call those who frequented the defendant's house and drank the beer which he sent in." Why not, in the case at bar, call those who bought of Wood, blankets marked in this extraordinary manner at the same time? The object is not to impute a fraud to the manufacturer (for we do not see any motive he could have to destroy the blankets), but to prove in a suit between other parties, that the injury did not arise from sea damage. And the evidence that the great number of bales of blankets which came that year, in six ships, from Wood's manufactory, had these distinguishing marks upon them, which are ascertained to have been such as would be occasioned by sulphuric acid, is we think admissible as tending to disprove the allegation of the plaintiffs, that the injury arose from the perils of the sea. . . . We are all of opinion that the judgment should be rendered upon the verdict.

50. LIST PUBLISHING CO. v. KELLER. (1887. FEDERAL DISTRICT COURT. NEW YORK. 30 Fed. 772.) . . .

In Equity. Bill for injunction to restrain infringement of complainant's copyright.

Wallace MacFarland, for complainant. *Edmund Wetmore*, for defendant.

WALLACE, J.—The parties are the proprietors and publishers of rival "society" directories, which purport to give the names and addresses of those persons in New York City who are supposed to be people of fashion. The complainant asserts that its copyrighted directory, "The List," is infringed by the defendant's directory, the "Social Register," and has made a motion for a preliminary injunction. The question in the case is whether the defendant, in compiling his directory, has done so by his own original labor, or whether, in order to spare himself time and expense, he has copied the

names and addresses given in the "Social Register" from the "List." If he has copied any part of the complainant's book, he has infringed the copyright. He has no right to take, for the purposes of a rival publication, the results of the labor and expense incurred by the complainant, and thereby save himself the labor and expense of working out and arriving at these results by some independent road. . . . The compiler of a general directory is not at liberty to copy any part, however small, of a previous directory, to save himself the trouble of collecting the materials from original sources. . . . Either of the present parties could lawfully use the general city directory to obtain the correct addresses of the selected persons; nor is it doubted that the defendant had the right to use the

complainant's book for the purpose of verifying the orthography of the names, or the correctness of the addresses, of the persons selected. But if the defendant has used the "List" to save himself the trouble of making an independent selection or classification of the persons whose names appear in the "Social Register," although he may have done so only to a very limited extent, he has infringed the complainant's copyright.

In a case like this, when a close resemblance is the necessary consequence of the use of common materials, the existence of the same errors in the two publications affords one of the surest tests of copying. The improbability that both compilers would have made the same mistakes, if both had derived their information from independent sources, suggests such a cogent presumption of copying by the later compiler from the first that it can be overcome only by clear evidence to the contrary. *Mawman v. Tegg*, 2 Russ. 393; *Spiers v. Brown*, 31 Law T. 16; *Lawrence v. Dana*, 2 Amer. Law T. (N. S.) 402. The complainant relies upon this criterion here. The "List" contains a selection of about 6000 names and addresses of persons residing in New York City out of the 313,000 names which appear in the general city directory. The "Social Register" contains about 3500 names and addresses of persons residing in New York City, and of this number over 2800 appear in the "List." The fact that 2800 of the names and addresses in the defendant's book originally appeared in the complainant's book would, standing alone, be quite inconclusive. But when it is shown that 39 errors

in complainant's book, consisting of misprints, erroneous addresses, insertion of names of persons who never existed, and insertions of names of deceased persons, are reproduced in the defendant's book, although it was not published until more than a year after the complainant's book was published, a strong presumptive case of piracy is made out. The depositions on the part of the defendant are addressed in part to an explanation of his reproduction of these errors consistently with the theory that they were not copied from the complainant's book. These depositions have been carefully read and considered, and the conclusion has been reluctantly reached that the explanation is inadequate. It will not be profitable to analyze the depositions. It suffices to state that the case for the complainant is such as to call for a full and explicit vindication on the part of the defendant. If it is true that his directory was prepared from several private visiting lists furnished to Ashmore for the purpose, these lists should have been produced or their non-production accounted for; and, if they could not be produced, corroborative testimony of their existence, the sources from which they were obtained, and their contents should have been adduced. It may be that the presumption which at present must prevail will be overturned by the proofs at the final hearing of the cause, but, as the case now appears, the complainant is entitled to an injunction. The injunction will be limited to the extent to which the defendant's book is identical with the complainant's book.

TITLE IV: EVIDENCE TO PROVE THE DOING OF A HUMAN ACT

53. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)

The general classification of Circumstantial Evidence (*ante*, No. 3) is into three groups: Concomitant, Prospectant, and Retrospectant. When the doing of a Human Act is the probandum, this classification is to be understood thus: Place yourself at a time before the Act, if any, was done; note any circumstance (*e.g.* a plan) that points forward to the act probably being about to be done or not done or done by a specific person; such circumstances are Prospectant. Then place yourself at the time and place of the Act, if any; note the circumstances (*e.g.* a knife with initials) which point to the doing or not doing of the act then and there, or its doing by a specific person; these form the Concomitant evidence. Then place yourself at a time subsequent to the Act, if any, and note the circumstances (*e.g.* stolen goods found on the accused) which point back in time to the doing or not doing of the act, if any, or its doing by a specific person.

No exact line can be or need be drawn between the three groups; they are merely useful for grouping typical cases.

54. ALEXANDER M. BURRILL. *A Treatise on Circumstantial Evidence*. (1868. p. 586.)

Taking for the subject of investigation, a case of murder, the following may be supposed to present the *corpus delicti*, as fully proved. A woman has been found at night, dead in her bed, with several wounds on the head, apparently inflicted with a hatchet or similar implement, and the bed itself partially consumed by fire. In the effort to discover the perpetrator of this offense, the following series of facts may be supposed to appear.

A. On examining the premises, during the night, and soon after the discovery of the crime, a man's hat or cloak is found on the ground in the rear yard of the house. . . . The questions which immediately and naturally suggest themselves, in reference to the article found, are: "How came it to be there?" and "What does it mean?" Viewed with reference to its *ordinary* uses, it indicates, as the reasonable cause of its existence, the presence of a man at the spot where it was found. But the fact has a more important aspect than this. The *extraordinary* position of the article gives to it an extraordinary character, indicating, as its immediate cause, the existence of some *unusual* occasion, and a correspondingly unusual condition on the part of the supposed wearer. . . . The principal fact of the crime affords the only means, yet known, of accounting for the minor fact just shown, and aids in giving to it the interpretation sought, which is this: that the wearer of the hat or

cloak was present at the scene of the crime, on the night of its commission ; and that he escaped from it in haste, and by an unusual way, in order to avoid observation. So far as the finding of the article in question is regarded as a purely physical fact, it implies, indeed, two successive presumptions or inferences : first, that the article actually belonged to, or was habitually worn by the individual supposed to be designated ; and next, that such individual was the person who wore it on the night of the murder. Each of these is liable to be met by what has already been explained as an infirmative supposition. . . . The article may not be satisfactorily and fully *identified* ; or, if identified, it does not necessarily follow that it was worn by the individual on the occasion ; *another* person, really connected with the crime, may, accidentally or intentionally, have obtained possession of it and worn it. . . .

Another fact of the same physical class comes to light. A hatchet, with which a blow competent to have inflicted the wounds observed on the body might have been given, and itself apparently stained with blood, is found (with indications of having been recently thrown there) in a corner of the yard of the premises, and not far from the spot where the other article was discovered : and this hatchet, also, is believed, or indeed proved to have belonged to the same individual. This is a still more important fact than the one already noticed. It indicates what is always necessary to be shown against any accused party, — the general fact of the *possession of the means* of crime.

Viewed by itself, the supposed bearing and meaning of this last circumstance might be met and explained or avoided by the same species of suppositions as were applied to the first one ; going to show that the appearance observed might not, or, indeed, did not proceed from the cause assigned. The implement may have been mistaken for another ; it may have been accidentally thrown where it was found ; what has been taken for blood upon it may be nothing more than rust ; or, if actually the party's hatchet, possession of it may have been acquired by another person. But the fact of *convergent* and *united bearing*, which now, for the first time, presents itself as an element of proof, begins to show that this common determinate tendency from two distinct points upon another, is not accidental, but must be due to the operation of some real, inducing cause, common to both. . . .

A third fact is brought to light. The *individual* supposed to have been the owner or wearer of the article or instrument found, or, at least, a person strongly resembling him, and by some sworn to have been the same person, is ascertained to have been actually *on the premises* where the crime was committed, on the night of its commission. This is a more important fact than either of those yet discovered. . . . It presents the *particular* human *agent* sought for, not presumptively and inferentially, as the other facts did, but directly and absolutely. It presents him as *possessing opportunity* to commit the crime ; a fact always necessary to be made out against every accused party. . . .

The facts, thus apparently *united* as discovered, are reasonably supposed to have actually *occurred* in the *same* connection ; and the interpretation which the discoverer and observer naturally give to them is this : that the individual indicated was concerned in the commission of the crime ; and that, seeking to escape by a back way, in order to avoid observation, he

accidentally dropped his hat or cloak, in his haste, or purposely threw it off as an encumbrance to motion; and that the implement was disposed of in a similar way. This interpretation gives to each fact a natural meaning. . . .

The probability on which it rests may still be met and qualified by the following infirmative suppositions. First, it may be a case of mistaken identity. . . . Next, conceding the point of identity, and that the individual supposed to have been seen was actually present, so long as an *exclusive* presence is not shown, it is possible that the crime might have been committed by another also present. But, here, again, the associated facts of the articles found present difficulties in the way of such an infirmative supposition. Still, there is room left for the following infirmative supposition, or rather hypothesis of the case, as it may, with stricter propriety, be termed, from its involving the assumption of *several* connected facts. The real criminal may have fabricated all the physical evidence hitherto discovered; and having possessed himself of the criminative articles, and finding the accused present on the premises, took advantage of that as a circumstance to aid his plans against him; and having waited until the accused had left the house, committed the crime and then threw the articles where they might seem to indicate the presence of the owner in the act of secretly making his escape.

But this whole hypothesis is subject to be overturned by a single additional fact. For, supposing it proved that the accused, towards whom all the previously discovered facts uniformly pointed, was seen, on the night of the crime, leaving the premises, or their immediate vicinity, by an unusual way, as over a fence; or in an unusual manner, as in great secrecy or in great haste; or in an unusual personal condition, as without a hat, — the case would be restored to the original criminative supposition that he did escape by the way indicated by the position of the articles, and that he dropped or threw them where they were found; the coincidence in regard to the hat, if such were the article, materially increasing its probability. . . .

Additional facts are brought to light. The accused, when seen on the premises, was observed to wear a cloak similar to the one found, and appeared to have something concealed under it. This favors the idea that he may have thus concealed the hatchet which was found, and evidently used. In the course of further inquiry, a piece of string is found to have been attached to the handle of the hatchet. A piece of string is now found attached to the cloak, and these two pieces, on being brought together, are ascertained to be of precisely the same kind, showing that they were once *united*. This close physical coincidence converts the conjecture just mentioned into a reasonable presumption, amounting almost, if not quite, to a certainty. And the bearing of these last circumstances, taken together, reveals a new and most material fact; showing that the accused went to the premises, *prepared* for the commission of the crime, and having adequate *means* of its commission, which means were actually used.

B. The circumstances which have thus far been supposed to be developed by a course of investigation are, almost exclusively, those of the *concomitant* class. . . . There is generally a disposition to carry this process a step further, by ascending to the ultimate *origin* of the whole transaction, and inquiring what could have induced or instigated the individual to whom the facts

point, as the cause of the crime, to have committed it; or, in other words, what motive he could have had for it. It is found that the individual in question had recently been on ill terms with the deceased, and had been heard to utter threats against her. Facts like these, showing not only a disposition and aptitude, but the elements of an actual intention to injure the deceased, have a peculiarly important influence in singling out one individual from among several others who might be supposed to have had equal *opportunity* and equal *means* of committing the same crime.

C. In order to render the case, as thus hypothetically constructed, the more entirely convincing, let it next be supposed that the following *subsequent* circumstances are discovered. Upon search being made after the suspected individual, he is found to have fled. He is pursued, and with some difficulty apprehended. On being questioned, he denies his name and all knowledge of the deceased, or of the crime; but on being searched, his name is found on various articles of his clothing, partially erased. A letter is also found from the deceased, requesting a meeting at the very time and place of the murder. On being interrogated where he was, on the night of the crime, he makes a statement which is found to be palpably false. On being committed to custody, he is detected in attempting to procure the destruction of the important physical evidence first discovered, and in endeavoring to prevail on a friend to have a false *alibi* sworn to, in his behalf.

Such are the various groups of facts available to indicate an act of crime.

**TITLE IV (continued): EVIDENCE TO PROVE THE
DOING OF A HUMAN ACT**

**SUBTITLE A: CONCOMITANT CIRCUMSTANCES TO PROVE THE
DOING OF A HUMAN ACT**

55. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹ A fact having a Concomitant indication is one which is thought of as being in existence at the time of and in connection with the act to be proved; the logical indication or inference is that the person bearing that fact as a mark is thereby to be associated more or less closely with the act. There is a *negative* as well as an *affirmative* form of inference; in the affirmative form, *e.g.* X was at the place of the murder, therefore he may have committed it; and the negative form, *e.g.* X was at a different place at the time of the murder, therefore he did not commit it.

The various subvarieties of this class of Evidence may be grouped into two:

1. Time and Place (Opportunity);
2. Physical and Mental Capacity, Tools, Clothes, etc.

1. *Time and Place. (a) Opportunity.* When an act is done, and a particular person is alleged to have done it (not through an agent, but personally), it is obvious that his physical presence, within a proper range of time and place, forms one step on the way to the belief that he did it. It is true that another person may have done it, but the former is at least within the limited number of persons who could have done it, and thus is fit to become a subject for further investigation.

Explanation. On the principle of Explanation (*ante*, No. 2, § 5), if A is shown to have been in a building when a murder was committed, he may admit this fact, and seek to diminish its probative significance by showing that there were in the same building, at the same time, two or ten or five hundred other persons. In so doing, he has pointed out the possibility of two or ten or five hundred other hypotheses, equally possible with that charged against him. The strength of these other hypotheses takes away the significance of the fact of his opportunity, just in proportion to the number and degree of naturalness of the other hypotheses — *i.e.* the hypotheses that each of the other persons had an equal opportunity. Such is the principle of explaining away Opportunity.

Since the showing of Opportunity leaves open all the hypotheses of other persons' equal opportunity, it is proper for the proponent of the evidence to strengthen it by cutting off in advance, so far as possible, these other hypotheses, *i.e.* by showing that the person charged was one of a few only, or the sole person, having the opportunity. In other words, while the proponent need not, he *may* always show exclusive opportunity.

¹ Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, §§ 130-144, 83-89.)

(b) *Essential Inconsistency (Alibi)*. The negative form of the Concomitant inference, is, if not the more common, at least the more effective one. It may be termed the argument from Essential Inconsistency. Its usual theory is that a certain fact cannot coexist with the doing of the act in question, and, therefore, that if that fact is true of a person of whom the act is alleged, it is impossible that he should have done the act. The form sometimes varies from this statement; but its nature is the same in all forms. The inconsistency, to be conclusive in proof, must be *essential*, *i.e.* absolute and universal; and its evidentiary strength will increase with its approach to absolute or essential inconsistency. There are five common cases of this form of the argument (though more are conceivable): 1. The absence of the person charged in another place (Alibi); 2. The absence of a husband (non-access), — a variety of the preceding; 3. The survival of an alleged deceased person after the supposed time of death; 4. The doing of a crime by a third person; and, 5. The self-infliction of the harm alleged.

2. *Capacity, Tools, Clothes, etc.* (a) For the doing of an act, certain traits or features physical or corporal may have been essential; the act shows that it was done by a person possessing them. Thus, physical strength (to wield a weapon), mental power (to execute a will), technical skill (to give poison, imitate handwriting, etc.), may be found to have been requisite; specific clothes or corporal marks may be found to have been an essential circumstance in the person who did the act; hence, the possession of such strength, power, skill, tools, clothes, or other marks is a circumstance pointing to a given person's share in the act.

Explanation here follows the usual lines of that principle.

(b) *Essential Inconsistency*. The negative argument of the present species is that since a particular mark is essentially concomitant to the act, a person lacking that mark could not have done it. *E.g.* a person lacking poison could not have given it to the deceased; a person lacking money could not have loaned it to the alleged debtor.

The following passages illustrate Concomitant evidence in various aspects.

Topic 1. Time and Place

56. ALEXANDER M. BURRILL. *A Treatise on Circumstantial Evidence*. (1868. pp. 368, 549.) This division may, without impropriety, be extended so far as to include not only those circumstances which are strictly contemporaneous with the criminal act, but those also which *immediately* precede and follow it.

The great leading circumstance of this class, the one which first occurs for consideration, and the one of which evidence is always specially sought, is that of *presence*, on the part of the accused, at the scene of crime, or company or juxtaposition with the subject of it, at the time of its commission; or, at least, of *proximity* or *vicinity* of the accused to the scene or subject of the crime, about such time. The force of the evidence, in these cases, consists in the concurrence or coincidence of the three leading circumstances of person, time, and place. The closer these are brought to the subject of the crime, the stronger their effect to demonstrate the presence of the accused, and to show such presence to have been exclusive.

1. *Proximity*, on the part of the accused, as thus presented for consideration, may be, in itself, of various degrees, from mere vicinity, up to actual juxtaposition or contact. It may also be of various kinds, such as proximity to the person of the deceased, or to the scene of the crime, or to both; and it may exist at different stages; as before the commission of the crime, or afterwards, or both before and after.

The strongest form in which this circumstance can be presented, and the one which requires the least reasoning to give it effect, is undoubtedly that of the juxtaposition of the persons of the accused and deceased, proved, by actual observation, to have existed both immediately *before* and immediately *after* the crime is perpetrated. These show presence *at the moment* of actual perpetration, with the greatest effect possible, short of direct evidence. . . . The circumstance of *time* is here of the utmost importance; for if the room were not entered immediately, but only after an interval sufficient to allow the escape of another person, the *exclusive* character and effect of the circumstances would be destroyed. This may be illustrated by the well-known case of Jonathan Bradford, in which the person who committed the murder found means to escape from the chamber of the deceased, only the instant before Bradford entered it.

The character of the *place*, also, is essential to the exclusive effect just mentioned. . . . Lord Coke's example of a violent presumption is of a *house* in which a man is run through with a sword and dies, and another is seen coming out of it with a bloody sword; and *no other person was at the time in the house*. This last fact undoubtedly constitutes the foundation of the presumption spoken of. Where this fact is clearly *proved*, it is not, indeed, necessary that the persons of the accused and deceased should be actually seen *together*, either before or after the commission of the crime. If they were in different parts of the same house, it would be sufficient; or even if the accused were only seen entering the house just before, and coming out of it immediately after; or only in the act of coming out, as in Lord Coke's example.

It is seldom, however, that cases occur, presenting merely these leading circumstances of personal proximity, time, and place. On the contrary, they are almost uniformly associated with other minor circumstances, immediately precedent or subsequent, or both, which have the double effect of proving a *corpus delicti*, and fixing the guilt of it upon the particular party whose exclusive presence is shown. As where a person is seen going into the apartment of another, with a loaded pistol; and, soon after, a shot is heard from within; and the apartment is immediately entered, and the occupant is found dead or dying from a mortal wound; and the other person is seen standing near, with a discharged pistol; and the wound is conclusively shown to have been inflicted with a pistol in the hands of some other person than the deceased; and no third person is found in the apartment.

The next form of personal juxtaposition, from which a presumption of guilt may be deduced against an accused party, is where it is observed to exist only *after*, and not before the commission of the crime. As where a man is found in a house, or in the open air, recently dead or dying from a mortal wound; and another is seen standing by him, or stooping

over him, or busied about him, or even just leaving him. If the circumstances of time and place concur (as they may) in excluding the presence of any other person, the result would be the same as in the preceding description of cases; a previous juxtaposition being necessarily inferred. Lord Coke's example is of a person *escaping from* a house in which another is found dead by violence; and yet it assumes an exclusive presence. Bradford's case was one of subsequent actual juxtaposition of persons, belonging strictly to the division now under consideration.

The next form of actual juxtaposition of the persons of an accused and deceased individual, from which a presumption of guilt may be deduced, is that which has been observed to exist only *previous* to the commission of the crime; as where the body of a murdered person is found in a building, or in the open air, and no one is or has been seen near it; but, some time before the body is found, or the crime ascertained to have been committed, the deceased was seen in company with the accused, and not far from the spot. The criminative effect of these circumstances is dependent, as in the cases before considered, upon those of time and place. . . . Hence, where a person has been found dead by violence, and no one near the body, or has suddenly and unaccountably disappeared, the first inquiry which naturally suggests itself, and the one which, in fact, is always made, is: "In *whose company* was he *last seen* alive?" In Corder's case, the deceased was last seen walking with the accused towards a barn, under the floor of which the dead body of the former was afterwards found buried. In the celebrated case of Spencer Cowper, much stress was laid on this circumstance to criminate the accused. In Thornton's case, the prisoner and the deceased were seen walking together, at a very late hour of the night on which the latter came to her death; and they were proved, by the physical evidence of footprints, to have been in the same field with the pit in which the dead body was found, and in the immediate vicinity of such pit. But the evidence as to the important circumstance of *time* failed to give to the facts their full criminative effect; and upon this ground, together with a doubt as to the *corpus delicti*, the accused was acquitted.

We come next to that description of cases in which no actual juxtaposition of persons has been observed, either before or after the commission of the crime, but only *proximity* to the scene of crime, of various degrees of closeness; this may be of very various degrees. In Barbot's case, the prisoner was not observed on his way to the scene of the crime, — the time being a late hour of the night; but he was seen, the next morning, returning from the spot in a canoe; and was satisfactorily traced all the way to his home. In Stewart's case, the accused was seen in the neighborhood of a ferry over which the deceased was expected to pass, inquiring of the ferryman, if he had passed. Soon after the deceased had come across the ferry, he was shot and killed by some person concealed in a wood through which the road lay; and, a few hours afterwards, at nightfall, the accused was seen and spoken with, on a hill just above the spot. . . . In Wood's case, the deceased was seen on the road, resting against a fence, and the prisoner about forty yards off, approaching him.

The next and last description of cases remaining to be considered under the present general head embraces those in which such care has been taken

by the criminal to avoid observation, that he has not been seen, either at or near the scene of the crime, or going towards it, or going from it, but his proximity, and indeed his presence are *inferred* from his movements at other points, before and after the crime was committed. . . . In Rush's case, the prisoner left his house in the evening, not long before the deceased, who lived in the neighborhood, was shot, and returned at about nine o'clock.

The weight and force of facts like these, when considered by themselves, consist merely in the coincidences and correspondences of *time* which they present; rendering the fact of presence *probable* in various degrees, but possessing no *exclusive* efficacy. . . .

2. The principal *infirmative* supposition applicable to the circumstance of opportunity to commit a crime, is that, admitting it proved to have existed, it does not necessarily follow that it was actually taken advantage of by the party shown to have possessed it; or that it was not taken advantage of by another person. In order to give it this effect, where it is solely or chiefly relied on, the circumstances tending to show its existence must be *exclusive* in their operation, by demonstrating that no other person had, or could have had the opportunity possessed by the accused, and that, therefore, by a necessary consequence, none but he could have committed the crime.

Its whole tendency is merely to show a *possibility* that the act might have been committed by the person supposed to be indicated; without any of that quality of positive *probability* in which the essence of the force of presumptive evidence resides. . . . Another person may have been present. The real murderer may have left the dead body, and escaped from the room or the house in which it is found, only the moment before the accused entered it. The real incendiary may have fled from the building fired, only the moment before the accused approached it. The presence of the accused himself, on such an occasion, may be accounted for upon grounds of humane and laudable intention to render assistance, or mere innocent curiosity, or even mere accident. The *exclusive* character of the accompanying circumstances, in regard to *means and modes of entrance* upon and exit from the scene of the crime, however apparently satisfactory, *may not be real*. The murderer may have escaped from the room or house, by a door, or even a window, the existence or capacity of which has been entirely overlooked. Supposing the exclusive presence of one particular person to be satisfactorily established, such person may not have been the accused, but *another person* more or less closely resembling him. In a case of supposed murder the circumstance that the accused was the *last person seen* in company with the deceased, previous to his death or disappearance; or, in other words, that the deceased when last seen alive was seen in his company, does not, of itself, necessarily exclude the possibility that *another* and *unseen* person may have joined the deceased, after the accused left him, perpetrated the crime, and effectually escaped. The circumstances of the accused leaving his residence *just before*, and returning to it *just after* the perpetration of a crime in the vicinity, merely show a coincidence of action, without any necessary criminative effect.

Hastiness of movement *towards* the scene of the supposed crime may have been prompted by a desire to render assistance, on hearing alarming sounds or cries from the spot. And hastiness of movement *from* the spot may have

been dictated by a similar desire to call for more adequate aid, or by a fear of impending danger to the party himself.

Secrecy of movement near the scene of the crime, even including the disguise of the person, may be explained on other suppositions than that of guilty intent. The lovers of servants are apt to be stealthy in their visits, and in this way are sometimes taken for thieves. And secrecy and disguise have sometimes been assumed and practiced out of mere sport.

57. JONATHAN BRADFORD'S CASE. (JAMES RAM. *On Facts as Subjects of Inquiry by a Jury.* 3d Amer. ed., 1863. p. 449.)

Jonathan Bradford, in 1736, kept an inn, in Oxfordshire, on the London road to Oxford. He bore a very unexceptionable character. Mr. Hayes, a gentleman of fortune, being on his way to Oxford, on a visit to a relation, put up at Bradford's. He there joined company with two gentlemen, with whom he supped, and, in conversation unguardedly mentioned that he had then about him a sum of money. In due time they retired to their respective chambers; the gentlemen to a two-bedded room, leaving, as is customary with many, a candle burning in the chimney corner. Some hours after they were in bed, one of the gentlemen, being awake, thought he heard a deep groan in an adjoining chamber; and this being repeated, he softly awaked his friend. They listened together, and the groans increasing, as of one dying and in pain, they both instantly arose and proceeded silently to the door of the next chamber, whence they had heard the groans, and, the door being ajar, saw a light in the room. They entered, and perceived a person weltering in his blood in the bed, and a man standing over him with a dark lantern in one hand and a knife in the other! The man seemed as petrified as themselves but his terror carried with it all the terror of guilt. The gentlemen soon discovered that the murdered person was the stranger with whom they had that night supped, and that the man standing over him was their host. They seized Bradford directly, disarmed him of his knife, and

charged him with being the murderer. He assumed, by this time, the air of innocence, positively denied the crime, and asserted that he came there with the same humane intentions as themselves; for that, hearing a noise, which was succeeded by a groaning, he got out of bed, struck a light, armed himself with a knife for his defense, and was but that minute entered the room before them. These assertions were of little avail; he was kept in close custody till the morning, and then taken before a neighboring justice of the peace. Bradford still denied the murder, but, nevertheless, with such apparent indications of guilt, that the justice hesitated not to make use of this most extraordinary expression, on writing out his mittimus, "Mr. Bradford, either you or myself committed this murder."

This extraordinary affair was the conversation of the whole country. Bradford was tried and condemned, over and over again, in every company. In the midst of all this predetermination, came on the assizes at Oxford. Bradford was brought to trial; he pleaded — not guilty. Nothing could be stronger than the evidence of the two gentlemen. They testified to the finding Mr. Hayes murdered in his bed; Bradford at the side of the body with a light and a knife; that knife, and the hand which held it, bloody; that, on their entering the room, he betrayed all the signs of a guilty man; and that, but a few moments preceding, they had heard the groans of the deceased.

Bradford's defense on his trial was the same as before the gentlemen: he had heard a noise; he suspected some villainy was transacting; he struck a light; he snatched the knife, the only weapon near him, to defend himself; and the terrors he discovered, were merely the terrors of humanity, the natural effects of innocence as well as guilt, on beholding such a horrid scene.

This defense, however, could be considered but as weak, contrasted with the several powerful circumstances against him. Never was circumstantial evidence more strong! There was little need of the prejudice of the county against the murderer to strengthen it; there was little need left of comment from the judge, in summing up of the evidence; no room appeared for extenuation; and the jury brought in the prisoner guilty, even without going out of their box.

Bradford was executed shortly after, still declaring that he was not the murderer, nor privy to the murder of Mr. Hayes; but he died disbelieved by all.

Yet were these assertions not untrue! The murder was actually committed by Mr. Hayes' footman: who, immediately on stabbing his master, rifled his breeches of his

money, gold watch, and snuffbox, and escaped back to his own room; which could have been, from the after circumstances, scarcely two seconds before Bradford's entering the unfortunate gentleman's chamber. The world owes this knowledge to a remorse of conscience in the footman (eighteen months after the execution of Bradford) on a bed of sickness. It was a death-bed repentance, and by that death the law lost its victim.

It is much to be wished that this account could close here, but it cannot! Bradford, though innocent, and not privy to the murder, was, nevertheless, the murderer in design: he had heard, as well as the footman, what Mr. Hayes declared at supper, as to the having a sum of money about him; and he went to the chamber of the deceased, with the same diabolical intentions as the servant. He was struck with amazement! he could not believe his senses! and, in turning back the bedclothes, to assure himself of the fact, he, in his agitation, dropped his knife on the bleeding body, by which both his hands and the knife became bloody. These circumstances Bradford acknowledged to the clergyman who attended him after his sentence.

58. WILLIAM SHAW'S CASE.

Remarkable Trials of All Countries.

William Shaw was an upholsterer at Edinburgh, in the year 1721. He had a daughter Catherine Shaw, who lived with him. She encouraged the addresses of John Lawson, a jeweler, to whom William Shaw declared the most insuperable objections, alleging him to be a profligate young man, addicted to every kind of dissipation. He was forbidden the house; but the daughter continuing to see him clandestinely, the father on the discovery, kept her strictly confined. William Shaw had, for some time, pressed his daughter to receive the addresses

(T. DUNPHY AND T. J. CUMMINS. 1873. p. 457.)

of a son of Alexander Robertson, a friend and neighbor; and one evening, being very urgent with her thereon, she peremptorily refused, declaring that she preferred death to being young Robertson's wife. The father grew enraged, and the daughter more positive; so that the most passionate expressions arose on both sides, and the words "barbarity," "cruelty," and "death," were frequently pronounced by the daughter! At length he left her, locking the door after him.

The greater part of the buildings in Edinburgh are formed on the

plan of chambers in English inns of court, so that many families inhabit rooms on the same floor, having all one common staircase. William Shaw dwelt in one of these, and a single partition only divided his room from that of James Morrison, a watch-case maker. This man had indistinctly overheard the conversation and quarrel between Catherine Shaw and her father, but was particularly struck with the repetition of the above words, she having pronounced them loudly and emphatically! For some little time after the father had gone out, all was silent, but presently Morrison heard several groans from the daughter. Alarmed, he ran to some of his neighbors under the same roof. These, entering Morrison's room, and listening attentively, not only heard the groans, but distinctly heard Catherine Shaw faintly exclaim: "Cruel father, thou art the cause of my death!" Struck with this, they flew to the door of Shaw's apartment; they knocked — no answer was given. The knocking was still repeated — still no answer. Suspicions had before risen against the father; they were now confirmed: a constable was procured, an entrance forced; Catherine was found weltering in her blood, and the fatal knife by her side. . . . Just at the critical moment, William Shaw returns and enters the room. All eyes are on him! He sees his neighbors and a constable in his apartment, and seems much disordered thereat; but at the sight of his daughter, he turns pale, trembles, and is ready to sink. The first surprise and the succeeding horror leave little doubt of his guilt in the breasts of the beholders; and even that little is done away on the constable discovering that the shirt of William Shaw is bloody.

He was instantly hurried before a magistrate, and upon the depositions of all the parties, committed to prison on suspicion. He was shortly after brought to trial, when, in his

defense, he acknowledged the having confined his daughter to prevent her intercourse with Lawson; that he had frequently insisted on her marrying Robertson; and that he quarreled with her on the subject the evening she was found murdered, as the witness, Morrison, had deposed: but he averred, that he left his daughter unharmed and untouched; and that blood found upon his shirt was there in consequence of his having bled himself some days before, and the bandage becoming untied. These assertions did not weigh a feather with the jury, when opposed to the strong circumstantial evidence of the daughter's expressions, of "barbarity," "cruelty," "death," and of "cruel father, thou art the cause of my death," — together with that apparently affirmative motion with her head, and of the blood so seemingly providentially discovered on the father's shirt. On these several concurring circumstances, was William Shaw found guilty, was executed, and was hanged in chains, at Leith Walk, in November, 1721.

There was not a person in Edinburgh who believed the father guiltless, notwithstanding his latest words were, "I am innocent of my daughter's murder." But in August, 1722, as a man, who had become possessor of the late William Shaw's apartments, was rummaging by chance in the chamber where Catherine Shaw died, he accidentally perceived a paper fallen into a cavity on one side of the chimney. It was folded as a letter, which, on opening, contained the following: "Barbarous father, your cruelty in having put it out of my power ever to join my fate to that of the only man I could love, and tyrannically insisting upon my marrying one whom I always hated, has made me form a resolution to put an end to an existence which is become a burthen to me. . . . My death I lay to your charge: when you read this, consider yourself as the inhuman wretch that plunged the murderous knife into the bosom of

the unhappy — Catherine Shaw." This letter being shown, the handwriting was recognized and avowed to be Catherine Shaw's by many of her relations and friends. It became the public talk; and the magistracy of Edinburgh, on a scrutiny, being convinced of its authenticity, or-

dered the body of William Shaw to be taken from the gibbet, and given to his family for interment; and as the only reparation to his memory and the honor of his surviving relations, they caused a pair of colors to be waved over his grave, in token of his innocence.

59. DOWNING'S CASE. (W. WILLS. *Circumstantial Evidence*. Amer. ed. 1905. p. 240.)

Two brothers-in-law, Joseph Downing and Samuel Whitehouse, in the year 1822, met by appointment to shoot, and afterwards to look at an estate, which on the death of Whitehouse's wife without issue would devolve on Downing. They arrived at the place of meeting on horseback, Downing carrying a gun barrel and leading a colt. After the business of the day, and after drinking together some hours, they set out to return home, Downing leading his colt as in the morning. Their way led through a gate opening from the turnpike road, and thence by a narrow track through a wood. On arriving at the gate, Downing discovered that he had forgotten his gun barrel; and a man who accompanied them to open the gate went back for it, returning in about three minutes. In the meantime Whitehouse had gone on in advance; and the prisoner, having received his gun barrel, followed in the same direction. Shortly afterwards Whitehouse was found lying on the ground in the wood, at a part where the track widened, about 600 yards from the gate, with his hat off, and insensible from several wounds in the head, one of which had fractured his skull. While the person by whom he was discovered went for assistance, the deceased had been turned over and robbed of his watch and money. About the same time Downing was seen in advance of the spot where the deceased lay, proceeding homeward and leading his colt; and a few minutes afterwards two men were seen following in the

same direction. Suspicion attached to Downing, partly from his interest in the estate enjoyed by the deceased, and he was put upon his trial for this supposed murder; but it was clear that he had no motive on that account to kill the deceased, as the estate was not to come to him until after failure of issue of the deceased's wife, to whom he had been married several years, without having had children; so that it was his interest that the way should not be opened to a second marriage. That the deceased had been murdered at all, was a highly improbable conjecture, and it was far more probable that he had fallen from his horse and received a kick, especially as his hat bore no marks of injury, so that it had probably fallen off before the infliction of the wounds. That the deceased, if murdered at all, had been murdered by the prisoner was in the highest degree improbable, considering how both his hands must have been employed, nor was there any evidence that the deceased had been robbed by the prisoner. It thus appeared, that these accumulated circumstances, of supposed inculpatory presumption, were really irrelevant and unconnected with any *corpus delicti*. The prisoner was acquitted; and it is instructive that about twelve months afterwards, the mystery of the robbery, the only real circumstance of suspicion, was cleared up. A man was apprehended upon offering the deceased's watch for sale, and brought to trial for the theft of it, and acquitted, the judge thinking that he ought not

to be called upon, at so distant a period, to account for the possession of the deceased's property, which he might have purchased, or otherwise fairly acquired, without being able to prove it by evidence. The accused, when no longer in danger, acknowl-

edged that he had robbed the deceased, whom he found lying drunk on the road, as he believed; but that he had concealed the watch, on learning that it was supposed that he had been murdered, in order to prevent suspicion from attaching to himself.

60. LOOKER'S CASE. (W. Amer. ed. 1905. p. 242.)

A farmer was tried under the special commission for Wiltshire, in January, 1831, upon an indictment which charged him with having feloniously sent a threatening letter, which was alleged to have been written by him. That the letter was in the prisoner's handwriting was positively sworn by witnesses who had had ample means of becoming acquainted with it, while the contrary was as positively asserted on the part of the prisoner by numerous witnesses equally competent to speak to the fact. But the scale appears to have been turned by the circumstance that the letter in question, and two others of the same kind sent to other persons, together with a scrap of paper found in the prisoner's bureau, had formed one sheet of paper; the ragged edges of the different portions exactly fitting each other, and the water-mark name of the maker, which was divided into three parts, being perfect when the portions of paper were united. The jury found the prisoner guilty, and he was sentenced to be transported for life. The judge and jury having retired for a few minutes, during their absence the prisoner's son, a youth about eighteen years of age, was brought to the table by the prisoner's attorney, and confessed that he had been the writer of the letter in question, and not his father. He then wrote on a piece of paper from memory a copy of the

WILLS. *Circumstantial Evidence.*

contents of the anonymous letter, which on comparison left no doubt of the truth of his statement. The writing was not a verbatim copy, although it differed but little; and the bad spelling of the original was repeated in the copy. The original was then handed to him, and on being desired to do so, he copied it, and the writing was exactly alike. Upon the return of the learned judge the circumstances were mentioned to him, and he had the prisoner tried upon a second indictment for sending a similar letter, when the son admitted in the witness box writing and sending all the three letters in question, and the father was at once acquitted. The son was subsequently indicted for the identical offense which had been imputed to the father: he pleaded guilty, and was sentenced to transportation for seven years. It appeared that he had had access to the bureau, which was commonly left open. . . . The correspondence of the fragment of paper found in the prisoner's bureau with the letter in question, and with the two others of the same nature sent to other persons, was simply a circumstance of suspicion, but foreign, as it turned out, to the *factum* in question; and considering that other persons had access to the bureau, its weight as a circumstance of suspicion seems to have been overrated.

61. REGINA v. CLEARY. (*Nisi Prius*. 1862. 2 F. & F. 850.)

The prisoner, a soldier, was indicted for the murder of one Houghton, at Chichester.

Roupell and *A. Smith*, for the prosecution. *Barrow*, for the defense.

The case for the prosecution was, that the prisoner had shot the deceased by mistake for one of his officers. The deceased, a student in the college at Chichester, had been shot in a lane leading thereto, and also leading to the barracks, a few minutes before twelve, on the night of the 16th of October. He uttered a loud shriek, which was heard at some distance, and he was immediately after found by a policeman and another man, named Bedford. He was shot just under the breast-bone, and was writhing in pain, and said to Bedford something which showed he was in dread of imminent death; but this the policeman did not hear him say. He said to the policeman, "Remove me, or I shall die of cold." He then said something else as to who shot him. He was removed into the college, where the principal spoke to him, and he seemed sensible, but did not speak. He died soon afterwards. . . . The prisoner, on the night of the 15th, the day before the murder, had been told that he was ordered for drill next day, and had uttered some angry words, saying he would not go, and would know who ordered it, and would go to the battalion order room to find out, and that he would "drill some one." That night, after going to bed, he left the barracks, and there was strong evidence that he had taken a rifle and ammunition with him. In about half an hour a shot was heard near the college, and some one, by the light of the flash, saw a man dressed in what seemed a soldier's greatcoat and cap running away. There was no other evidence as to who fired the shot, but the theory of the prosecution was, that it was an attempt by the prisoner to shoot one of his officers. There was no evidence, however, of any of them having been walking near the spot at the time. He had not returned to barracks, and a man, described as dressed like him, in a soldier's coat and cap, with a musket, had been

seen by more than one witness next night, near the place where the deceased was shot, standing under the hedge. And this man was so seen there just before the shot was fired. Not far off from the spot the prisoner's rifle was found, loaded, laid down half covered up under a hedge. The prisoner was seen next day, the 17th, three or four miles off, without his rifle. And when arrested on that day he was at some distance from Chichester, going towards Petworth. He ran away when he saw the officer, and said he was a deserter, and had left Chichester two days ago. When told of the murder, he said, "I had nothing to do it with." When told that there had been a rifle found, he said, "How do they know it was taken out of the barracks? Have they found one?" When told that it had been found, he said, "It is not mine." After his arrest, he said he had applied in August to Major Bush, the commanding officer of his company, for a "pass" to see his brother, and had been refused; and on another occasion said he doubted not the major would hang him if he could, and that he hoped the major would have him drummed out. He also said that the major had been shot at twice before in China, and that he knew who did it. It came out that several soldiers were out of barracks the night before the murder, but on the night of the murder it did not appear that any other soldier than the prisoner was out, or that more than one rifle was missing. There was, however, no evidence that the major or any other officer would be likely to be in the lane about the time of the shot, or that any of them had been there.

At the close of the case, ERLE, C. J. (to the jury).—There are two questions for you: First, was the deceased murdered? Secondly, was he murdered by the prisoner?

On the first question there can be little doubt, for if the shot was

fired by accident, and with no intent to kill any one, the person who fired it, and who must have heard the shriek uttered by the deceased, would have gone to his assistance. It is plain that whoever fired the shot meant to kill some one, and to leave his victim to die.

Then the second question arises, was the prisoner the person who fired the shot? Now there is no express evidence that he was, and it is only to be inferred from circumstances, — partly from the evidence of identity; partly from the suggested motive or intent of the prisoner to kill some other person. As to the evidence of identity, it is doubtful and slight, and no one speaks clearly to having seen the prisoner near the spot at the time, but only to a person dressed like him, *i.e.* in the common dress of a soldier. It is true that one or two speak to having seen a man dressed like a soldier, and with a gun. And if you are satisfied that the prisoner took a gun with him, then that would bear strongly against him, not only as to the identity, but as to the falsity of the statement he made that he had not a gun with him, and also as to the finding of a gun near the spot in the way he took. But even assuming that he had a gun, that would not be conclusive that he was the man who fired the fatal shot. It is suggested that it is to be inferred that he was so from the fact that he had uttered angry words or threats against any one who had to do with his being ordered to drill next day. But there is no evidence that he had found out who had had to do with it, or that he had conceived enmity against any particular person, or that any person against whom he might be supposed to have an enmity was or would be likely to be at the spot at or about the time of the fatal shot. . . . The question comes to this: on the whole of the evidence, are you satisfied that he fired that shot? That is, fired it intentionally, for the the-

ory of accidental firing seems (for the reason I have given) untenable.

Verdict, not guilty.

[Reporter's Note.] A verdict which met the approval of all lawyers, although great doubt and dissatisfaction was expressed among laymen. It was said that there was no moral doubt of the man's guilt. Nor was there, if all the facts were taken as clearly proved on which the theory of the prosecution was based. But then the great fact it required, that the prisoner had fired the shot, was not clearly proved; even assuming that it was proved that he took a gun with him. For whether that was the gun fired, and he was the man who fired (which no doubt may be taken as facts in substance the same), must depend, as the Lord Chief Justice pointed out, partly on evidence of identity, which was doubtful, and partly on the assumed or suggested theory of motive and intent, as to which, not only was there doubt, but there was an utter blank and defect in the evidence; for it was not proved that any officer who had had to do with the order to drill, or who might be supposed to have had to do with it (Major Bush, for instance), was or would be likely to be on the spot at the time the shot was fired. The case for the prosecution went upon the theory that one man had been shot by mistake for another, and the evidence of identity was so doubtful, that though, if it had been clearly proved that the prisoner had fired the shot willfully at any one, it would not have mattered whether he fired at the deceased; yet, as the evidence of identity was so doubtful, and it was sought to eke it out by a presumption that the prisoner was the man who fired the shot, because he had a design to shoot some one, it was essential to prove that the man whom he meant to shoot was or might be supposed to have been on the spot, otherwise, it is obvious

there could be no greater reason to presume that the prisoner had fired *this* shot than any *other* shot, or that the prisoner had fired it rather than any other person.

The verdict was supposed to have gone on the notion, that if one man is shot by mistake for another, it is not murder! A notion quite contrary to the clear meaning of the charge, and probably to the common knowledge of all men. But the verdict went upon *this*, that if the main proof or main part of the proof, that the prisoner fired the shot, is, that he meant to kill *some one else* (which, per se, rather negatives the idea that he did so) it must at least be clearly proved, that the person whom he meant to shoot was on the spot, or might

have been *supposed* to be. This was not only not proved, but there was no evidence of it, so that the case broke down on what turned out to be its vital point. For, striking that out, the case for the prosecution, even assuming an intent to kill an officer, and even assuming an attempt to do so, on the part of the prisoner, was quite consistent with the theory that he had abandoned the attempt, laid aside the gun, and gone away, and that some other person had fired the shot, either against the deceased or some one else. The only person who spoke to the *personal* identity of the prisoner, as distinguished from the mere common likeness of a soldier's dress, saw him three or four miles off and *without* a gun.

62. ALEXANDER M. BURRILL. *A Treatise on Circumstantial Evidence*. (1868. p. 511.) If the accused can make it appear, that, at the very time when the crime charged is alleged to have been committed (it being of a nature to require his personal presence) he was *in another place*, a result of the same kind will be established; founded on the obvious impossibility that the same person could have been in two different places at the same time. This species of defense is familiarly known as an *alibi*. . . .

A leading rule in the application of this description of evidence is, that the time relied on, and in which the value of the evidence essentially consists, must *correspond closely* with the time at or during which the offense is proved to have been committed.

Sometimes, all that can be proved is that the crime was committed, or must have been committed, during a space of time embracing several hours: as, during a night or part of a night, or during a forenoon. In such cases, the *alibi* evidence relied on, in order to be effectual, must be applied to and cover the *whole* of such period. A good illustration of this position is presented in Richardson's case. It was satisfactorily proved, in that case, that the crime had been committed during the forenoon of the day specified. To meet this, the prisoner adduced evidence to show that, during that same forenoon, he was engaged at work, with his fellow servants, at some distance from the cottage which was the scene of the crime. Here was a seemingly entire correspondence between the two facts, in the important particular of time; bringing the facts themselves in direct opposition to each other. But, on a closer scrutiny of all the circumstances, it was found that the accused had not been in company with his fellow workmen, during *the whole* of the forenoon in question; but that there was an *interval* of about *half an hour*, during which he had *absented* himself from them. This apparently short interval served to destroy the effect of the whole evidence. For it was satisfactorily shown that it was long enough to have admitted of his going to the cottage, committing the crime and returning to his companions;

and this was subsequently proved to have been the actual fact, by the prisoner's own confession. . . .

Where the time proved as that of the commission of the crime, and that shown by the *alibi* evidence, are not identical, but only proximate to each other, the inference deducible from a view of both periods in connection, is not always one of necessity and certainty, rendering the fact of the party's presence at the scene of crime incredible under any circumstances, or incredible *in toto*; but often one of improbability, more or less strong, rendering the fact of presence incredible in degree only, and according to circumstances. . . .

The two circumstances, the aid of which is indispensable in determining this question, — whether it were actually and physically impossible, and therefore at once incredible, that the party was, or could have been, at both places, consecutively, — are, the *distance* between the two places, and the *rapidity* with which the party could have moved from one to the other.

63. ABRAHAM THORNTON'S CASE. (W. O. WOODALL. *Reports of Celebrated Trials*. 1873. Vol. I, p. 23.)

[The general features of this case are stated in No. 162, *post*. The accused's whereabouts at the precise hour of 4.30 A.M. on the night of the death were evidenced by his own testimony to the committing magistrate and by other witnesses. A diagram to illustrate this testimony is given facing page 160.]

Abraham Thornton. — "Saith that he is a bricklayer; that he came to the 'Three Tuns' at Tyburn about six o'clock last night, where there was a dance. . . . Examinant stayed until about twelve o'clock. He then went with Mary Ashford. . . . They then turned to the right and went along a lane until they came to a gate and stile on the right-hand side of the road; they went over the stile and into the next piece, along the fore drove; they continued along the foot road four or five fields, but cannot tell exactly how many. Examinant and Mary Ashford then returned the same road . . . and whilst they stood there a man came by. . . . That examinant and Mary Ashford stayed at the stile a quarter of an hour afterwards; they then went straight up to Mr. Freeman's again, crossed the road and went on towards Erdington till he came to a

grass field on the right-hand side of the road, within about 100 yards of Mr. Greensall's, in Erdington. Mary Ashford walked on, and examinant never saw her after she was nearly opposite Mr. Greensall's. . . . It was then four o'clock, or ten minutes past four o'clock. Examinant went by Shilley's in his road home, and afterwards by John Holden's where he saw a man and woman with some milk cans, and a young man driving some cows out of a field who he thought to be Holden's son. He then went towards Mr. Twamley's mill where he saw Mr. Rotton's keeper taking the rubbish out of the nets at the floodgates. He asked the man what o'clock it was; he answered near five o'clock or five. He knew the keeper. Twamley's mill is about a mile and a quarter from his father's house with whom he lives. The first person he saw was Edward Teck, a servant of his father, and a boy."

W. Jennings. — "I am a milkman and live at Birmingham. I buy milk of Mr. Holden, of Erdington; myself and wife were at his house on the morning of the 27th of May. I remember seeing the prisoner coming down the lane which leads

from Erdington to Mr. Holden's. He was going towards the house. It was as near as I can judge, then about half past four. I had no watch with me. We milked a cow a piece in the yard after we saw him, which might occupy us ten minutes. My wife then asked Jane Heaton what o'clock it was. The prisoner was walking very leisurely. My wife saw him as well as I." Cross examined by Mr. *Clarke*. "I was standing in the lane within about thirty yards of Mr. Holden's house on the great road when I first saw Thornton. I had been standing there about ten minutes. When I first saw the prisoner, he was within twenty yards of us, coming down the lane between Mr. Holden's house and the canal lane. . . ."

Martha Jennings. — "I saw the prisoner on the 27th of May walking gently along the lane leading to Mr. Holden's house. I then went to milk the cows, and inquired of Jane Heaton the time of day a little while afterwards. Between the time of milking the cows and seeing the prisoner might be a quarter of an hour. I was standing near Holden's house when he passed me. . . . The prisoner was walking leisurely, and did not seem in a hurry, or the least confused."

Jane Heaton. — "I live servant with Mr. Holden. I was getting up at half past four on the morning of the 27th of May. My bedroom window looks into the lane which leads from Erdington to Castle Bromwich. I saw a man, whom I supposed to be the prisoner, walking towards Castle Bromwich. He was walking quite slow. About a quarter of an hour after, Jennings's wife came and asked me what time of the day it was. I looked at the clock, and observed that it wanted seventeen minutes of five. The clock was not altered for several days after that."

John Holden. — "I was at home on the 28th of May last,

when Mr. Twamley came to examine my clock. I believe it to be a very good one. . . ."

Mr. *William Twamley*. — "I live at Newhall Mills, near Sutton Coldfield, and within three miles of Castle Bromwich. I caused the prisoner to be apprehended. I compared my watch and Holden's clock on the 28th of May; they were exactly alike as to time. From Mr. Holden's I immediately went to Birmingham, and my watch agreed exactly with St. Martin's Church clock there."

John Haydon. — "I am gamekeeper to Mr. Rotton, of Castle Bromwich. I left my own house about ten minutes before five of the morning of the 27th of May. As I passed by Mr. Z. Twamley's, I heard Mr. Rotton's stable clock strike five. About five minutes after I saw the prisoner. He was then coming towards Mr. Twamley's mill, as if from Erdington to Castle Bromwich. I knew him very well. I asked him where he had been. He said, 'To take a wench home. . . .'"

W. Crompton. — "I saw Mr. Webster on the morning of the 27th of May in the field in which were the footsteps. We rode to Castle Bromwich together. Mr. Webster compared his watch with mine; we perfectly agreed. Our watches were according to Birmingham time. We found our watches were fifteen minutes slower than Mr. Rotton's stable clock. The Birmingham clocks and those at Castle Bromwich differed fifteen minutes. . . ."

[On a later argument of law, involving the proof of alibi] Mr. *Tindal* contended that even admitting all the defective part of the allegations in the counterplea to be struck out, still there did remain sufficient *prima facie* evidence against the defendant. . . . There was abundance of other proof to show the impossibility of the defendant's having committed the crime charged against him. It appeared

from the replication that about quarter past four Mary Ashford left the house of Mary Butler. She had then a mile and a half to go to the pit; and he thought he should not be allowing too much time for a woman to go such a distance in saying twenty minutes. Then she reached the pit at twenty-five minutes before five. He would now ask according to the replication, where was Thornton at that time? The answer would be, taking the latest moment, that at twenty-five minutes before five he came up with another person a mile and a half from the pit. When Mary Ashford arrived at the pit, the circumstances of rape and murder,

according to the counterplea, were yet to happen; events which, according to the experience of courts of justice, must have occupied at the smallest computation a quarter of an hour. This brought them to ten minutes before five, at which precise moment they had Thornton meeting another person, namely, John Haydon, a mile further from Holden's farm, and two miles and a half from the pit. From thence he was traced still departing from the pit until he reached Castle Bromwich; so that in point of fact, it was utterly impossible for Thornton to have committed the acts imputed to him. . . .

64. FRANK ROBINSON'S CASE. (T. DUNPHY and T. J. CUMMINS. *Remarkable Trials of all Countries*. 1873.)

[On Saturday night, April 9, 1836, Helen Jewett, an inmate of a house of ill fame, was murdered in her room; the body was discovered about 4 A.M.; a man who had been with her that night had disappeared; the accused was said to be the man].

Rosina Townsend, after being sworn, deposed as follows: "I was acquainted with Helen Jewett. The last time that I saw Helen Jewett alive was on Saturday night, the 9th of April last [in my house]. The prisoner at the bar was known to me by the name of 'Frank Rivers' and by no other name. . . . I saw the prisoner at the bar on the night that Helen Jewett was murdered. A person knocked at my hall door; I went to the door and asked who was there? This was about nine o'clock, or it might have been as late as half past nine. When I asked who was there — the door was still locked — I asked a second time the same question. . . . The reason that I wished to ascertain this was that Miss Jewett had requested me in the course of the evening not to admit a certain young man by the

name of Bill Easy to see her if he should happen to come there. . . . The reason that Helen Jewett assigned to me for not wishing to see Bill Easy on that night was that she then expected Frank Rivers to visit her. . . . I mean by Frank Rivers Mr. Robinson — the prisoner at the bar. When I opened the door, I discovered that it was Frank Rivers (or Mr. Robinson) who was there. . . . When I called Helen I told her that Frank had come. When I told her this he had turned the entry to go upstairs. . . . Immediately on Frank's going upstairs, Helen Jewett came out of the parlor and followed him up. When she came out of the parlor she took hold of Robinson's cloak, and said: 'My dear Frank, I am glad you have come. . . .' That was the last that I saw of the prisoner at the bar on that night. . . ." Cross-examined by Mr. *Maxwell*. "I am 39 years of age. . . . There were two visitors at my house who called themselves Frank Rivers, the prisoner at the bar being one of them. . . . Shortly after I admitted Mr. Rivers (Robinson) and he had gone upstairs, I retired to

my sleeping room. That was about nine or half past nine o'clock. . . ."

The defense was opened by Mr. *Ogden Hoffman* in one of those brilliant effusions, which in the course of his long and extensive practice justly acquired for him an imperishable celebrity. . . . In conclusion the learned gentleman stated, that he and his associate counsel should rely greatly for the complete exculpation of their client by proving by the testimony of a highly respectable tradesman a positive alibi, showing that the prisoner up to past ten o'clock, on the night of the 9th of April last (the night of the murder), was smoking cigars in a grocery store in this city situated full a mile and a half from the house of Rosina Townsend, in Thomas Street. . . .

Robert Furlong, on being sworn, was examined by Mr. *Hoffman*, and deposed as follows: "Keep a grocery store at the corner of Nassau and Liberty streets. . . . Know the prisoner at the bar by sight. He has often been in my store to buy cigars. . . . The prisoner was in my store the Saturday night previous to the murder. He came there, as near as I can remember, about half past nine o'clock. He bought at the store a bundle of cigars, containing twenty-five. After he bought the cigars, he lighted one, and took a seat on the barrel and smoked there until ten o'clock. When the clock struck ten, that gentleman (the prisoner) took out his watch and looked at it. He said that his watch, which was a small silver lepine, was one minute past ten o'clock. I also took out

my watch, which I had regulated on that day by Mr. Harold of Nassau Street, and compared my watch with his. When the clock struck, my partner said, 'There's ten o'clock, and it is time to shut up.' That was our usual time and the porter went out to put up the shutters. . . . When we got completely shut up, Mr. Robinson remarked to me that he was encroaching on my time. I replied, 'Oh, no, not at all; I shall remain at the store until the boy returns.' . . . Before he went away, he stood a short time on the stoop, and afterwards said, 'I believe I'll go home; I'm tired,' and then bade me good-night. It must have been full ten or fifteen minutes after ten when he left my store. . . . I am now positive that the prisoner here is the person who was in my store on the ninth of April. I cannot be mistaken in this. Am not related to the prisoner, nor to any of his connections, in any way, even in the most distant manner. . . ."

Henry Burnham, examined by Mr. *Phenix* for the prosecution.— "I am deputy keeper for Bellevue. I know Mr. Furlong. . . ." By a Juror.— "I have the utmost confidence in Mr. Furlong's integrity and oath. I have known him for eight years, and I never knew anything of him but good." At the close of this witness's examination, the juror who proposed the last material question stated that the object of his asking it was merely to satisfy some of the jurors who did not know Mr. Furlong as well as some of the others. . . .

[The accused was acquitted.]

72. **ANON.** (C. AINSWORTH MITCHELL. *Science and the Criminal*. 1911. p. 199.) . . .

A striking example of the way in which the scientific evidence may succeed in establishing the innocence of a person accused of murder is seen in the following case, which was tried in 1835: A woman, who had a violent disposition and was subject to attacks of hysteria, accused her husband of having attempted to poison her, and in proof of her charge produced a white powder, which, as she alleged, he had put into her food. The powder was found to be white arsenic, and the food on examination was found to contain a fatal quantity of that poison. The husband was therefore immediately arrested and kept in prison pending the investigation. The woman was perfectly well for eight days, but on the ninth day became very violent, and did many eccentric things, and on the next

day she died. Examination of the body showed that arsenic had been the cause of death. Her husband denied that he had ever put any arsenic into her food. But had it not been for the scientific evidence he would probably have been unable to prove that he was innocent. Undoubtedly he owed his escape to his having been in prison for the eight days between the accusation brought by his wife and her death, for the medical witnesses proved that it was not possible for him to have given the dose of arsenic which caused the death of the woman, since the effects of arsenic could not have remained latent in the system for that length of time. Circumstances, therefore, indicated that the woman had committed suicide, and on the strength of this evidence the prisoner was immediately set at liberty.

Topic 2. Physical and Mental Capacity, Tools, Clothing, etc.

73. ALEXANDER M. BURRILL. *A Treatise on Circumstantial Evidence*. (Amer. ed., 1868. p. 263.) The participation of the accused in the crime proved to have been committed is shown by those physical facts or appearances which connect him with it; affording so many natural coincidences, harmonizing with the supposition of his guilt. They are, in other words, the traces, marks, or indications, more or less distinct and impressive, of the presence of a particular criminal agent; . . . and may be enumerated in the following order.

1. Impressions *directly* from the person; such as prints in earth or snow of the feet or shoes, and impressions of other parts of the body. Of these (especially in cases of crime committed in rural districts) *footprints* are the most common. They may be considered as of two kinds: *ordinary* footprints, exhibiting no peculiar characteristics; and impressions of a *peculiar* character. The former are important, first as showing the general fact that one or more persons have been present; secondly, as indicating the direction from which they approached, or in which they left the scene of crime, and their movements about it; and, thirdly, as more immediately indicating the particular perpetrator by inferences which they tend to establish. Im-

pressions from *other parts* of the body than the feet sometimes answer a similarly useful purpose, in detecting and identifying an offender. In the case of *Rex v. Brindley*, impressions were found in the soil, near the scene of crime, which was stiff and retentive, of the knee of a man who had worn breeches made of stripped corduroy, and patched with the same material, but the patch was not set on straight; the ribs of the patch meeting the hollows of the garment into which it had been inserted; which circumstances exactly corresponded with the dress of the prisoner. Impressions made even by the *teeth* have sometimes furnished important criminative evidence. Mascardus has related an instance, where an enclosed ground, set with fruits, was broken into by night, and several of them eaten; the rinds and fragments of some of which were found lying about. On examining these, it appeared that the person who ate them had lost *two front teeth*, which caused suspicion to fall on a man in the neighborhood, who had lost a corresponding number; and he, on being taxed with the theft, confessed his guilt.

2. Impressions made by *instruments* used by the person come next to be considered. These operate, in the detection of the criminal, in two ways, as just observed respecting footprints, that is to say: first, generally, as indicating the quarter from which the offender came; and they may have this effect, though the instruments themselves are not found; secondly, specially, as identifying the guilty person; and this is effected, where the instruments themselves are found, by comparing them with the impressions. As an instance of the former, marks of violence, such as impressions of a chisel, on the outside of the doors or windows of a building, indicate the general fact that the robber or murderer came from without. . . . As instances of impressions of instruments specially indicating the offender may be mentioned marks of an iron instrument upon the windows of a house, corresponding with a chisel found in the prisoner's possession, or proved to have been used by him.

3. Marks made by instruments held or used by the offender in a *peculiar* manner. These often contribute material aid in fixing the charge of guilt on a particular individual. Thus, where, on examination of the body of a murdered person, the fatal wound appears to have been inflicted by one who held the instrument in his left hand.

4. *Objects left* at the scene of crime, by the supposed offender, being identified as belonging to him or previously seen in his possession. Of this description of traces of the person are the instruments of crime themselves; such as the pistol, razor, knife, or hatchet used in committing a murder; articles of dress; such as a hat, a glove, a neckcloth, a cloak, and the like. These furnish obvious means of identifying the criminal.

5. *Objects left* at the scene of crime, corresponding with other objects in the possession of the supposed offender. Such as a bullet, extracted from the body of the deceased, accurately fitting the barrel of a pistol, or a bullet mold, found on the accused; shot taken from the wound, and ascertained to be of the same quality with other shot found in his possession; patches and tow wadding, found near the body of the deceased, corresponding with similar patches found in the prisoner's rifle box; and the like.

6. *Fragments* or portions of objects found at the scene of the crime, corresponding with other portions of objects, found on the accused, or known to have been in his possession. Of this description are: a piece of the

blade of a knife, found sticking in the window frame of a house which had been broken into, corresponding with a broken-bladed knife found in the prisoner's pocket; . . . a fragment of a printed paper, or of a letter, used as wadding for the charge of the firearm with which the crime was committed, corresponding with another piece found on the prisoner's person or premises; a portion of a sheet of paper on which a letter has been written, corresponding with another portion found in the prisoner's desk; and the like.

74. THE SHEFFIELD CASE. (H. L. ADAM. *The Story of Crime*. 19 —, p. 294.)

One of the most remarkable instances of how evidence, circumstantial evidence, can miscarry, so to speak, and point in a direction diametrically opposed to the truth, was that in connection with the Sheffield industrial riots. During this period of strife a good deal of violence was used towards the "blacklegs," which included the throwing of explosive bombs. On a certain night a bomb was thrown into the house of a man who was regarded by the strikers as an "undesirable," which resulted in the man's death. At the moment of the explosion a woman in a neighboring house happened to look out of her window, when she saw a man running hastily from the scene of the outrage. She was able to get a good view of his face, and also saw the sleeve of his coat catch on a protruding hook outside a butcher's shop. Tearing himself free from this, he disappeared. But with the assistance of this woman the police were able to arrest the man,

who was immediately identified by the witness. On the meat hook outside the butcher's shop the police found a piece of cloth which had been torn from the fleeing man's coat; the coat sleeve of the man arrested was torn and a piece of cloth missing, which was found to be that on the hook outside the butcher's shop. There could be no doubt about it, the cloth was precisely the same and the piece fitted exactly. This seemed conclusive evidence, in all conscience.

Yet it was entirely misleading as subsequent events proved. It was quite true that the man in question was running from the scene of the outrage as the woman declared, it was also perfectly correct that his coat caught on the hook outside the butcher's shop, that he tore it away and disappeared. But he did not throw the bomb; he, however, saw the man who did, and he was simply running away for *his own protection!*

75. THE OBSTINATE JURYMAN'S CASE. (S. M. PHILLIPPS. *Famous Cases of Circumstantial Evidence*. No. XXI.)

Two men were seen fighting together in a field. One of them was found, soon after, lying dead in that field. Near him lay a pitchfork which had apparently been the instrument of his death. This pitchfork was known to have belonged to the person who had been seen fighting with the deceased; and he was known to have taken it out with him that morning. Being

apprehended and brought to trial, and these circumstances appearing in evidence, and also that there had been, for some time, an enmity between the parties, there was little doubt of the prisoner's being convicted, although he strongly persisted in his innocence. But, to the great surprise of the court, the jury, instead of bringing in an immediate verdict of guilty, withdrew

and, after staying out a considerable time, returned and informed the court, that eleven, out of the twelve, had been, from the first, for finding the prisoner guilty; but that one man would not concur in the verdict. Upon this, the judge observed to the dissentient person, the great strength of the circumstances, and asked him how it was possible, all circumstances considered, for him to have any doubts of the guilt of the accused? But no arguments that could be urged, either by the court or the rest of the jury, could persuade him to find the prisoner guilty; so that the rest of the jury were at last obliged to agree to the verdict of acquittal.

This affair remained, for some time, mysterious; but it at length came out, either by the private acknowledgement of the obstinate jurymen to the judge who tried the cause (who is said to have had the curiosity to inquire into the motives

of his extraordinary pertinacity), or by his confession at the point of death (for the case is related both ways), that he himself had been the murderer! The accused had, indeed, had a scuffle with the deceased, as sworn on the trial, in which he had dropped his pitchfork, which had been, soon after, found by the jurymen, between whom and the deceased an accidental quarrel had arisen in the same field; the deceased having continued there at work after the departure of the person with whom he had been seen to have the affray; in the heat of which quarrel, the jurymen had unfortunately stabbed him with that very pitchfork, and had then got away totally unsuspected; but finding, soon after, that the other person had been apprehended, he had contrived to get upon the jury, as the only way of saving the innocent without endangering himself.

76. THE YARMOUTH MURDER. (C. AINSWORTH MITCHELL. *Science and the Criminal*. 1911. p. 34.)

No more extraordinary instance of a single circumstance leading to the detection of a criminal can be offered than in what was known as the "Yarmouth Murder."

On September 23, 1900, a woman was found lying dead upon the beach at Yarmouth, and from the appearance of the body she had evidently been strangled. On her fingers were some rings, but with the exception of the laundry mark upon her clothes, there was no clew by which she could possibly be identified. She had been staying for some days in lodgings in the town, and was known to her landlady as Mrs. Hood. While she was there letters bearing a Woolwich postmark had come addressed to her by that name. Only a day or two before her death she had had her photograph taken upon the beach. All investigation to discover who the woman really was

or to trace her murderer proved unavailing, and at the coroner's inquest a verdict was brought in of willful murder against some person unknown. Subsequently it was discovered that the laundry mark upon the dead woman's clothes, 599, was that put by a laundry upon the clothes sent to them from a particular house in Bexley Heath. Further inquiry showed that a woman named Bennett had formerly lived there, and she was identified as the original of the photograph that had been taken at Yarmouth. This led, early in November, to the arrest of the dead woman's husband, Bennett, who was a workman in Woolwich Arsenal, and he was committed for trial on the charge of murder. He denied all knowledge of the crime, and asserted that he had never been to Yarmouth. This was disproved, however, by collateral evidence, and many facts

were brought forward connecting the prisoner with the murder. The motive alleged for the crime was that Bennett might be free to marry another woman. The date of the wedding had been fixed, and it was shown that his behavior

after the night of the murder pointed to his having a knowledge of his wife's death. So convincing was the whole of the circumstantial evidence, that after a short deliberation the jury brought in a verdict of "Guilty," and Bennett was executed.

77. THE CASE OF THE PAIR OF GLOVES. (CHARLES DICKENS. *Three Detective Anecdotes*. Works, Nelson ed., 1901. Vol. XVII, p. 546.)

It's a singular story, sir (said Inspector Wield, of the Detective Police, who, in company with Sergeants Dornton and Mith, paid us another twilight visit, one July evening); and I've been thinking you might like to know it. It's concerning the murder of the young woman, Eliza Grimwood, some years ago, over in the Waterloo Road. She was commonly called The Countess, because of her handsome appearance and her proud way of carrying herself; and when I saw the poor Countess (I had known her well to speak to), lying dead, with her throat cut, on the floor of her bedroom, you'll believe me that a variety of reflections calculated to make a man rather low in his spirits, came into my head. That's neither here nor there. I went to the house the morning after the murder, and examined the body, and made a general observation of the bedroom where it was. Turning down the pillow of the bed with my hand, I found, underneath it, a pair of gloves. A pair of gentleman's dress gloves, very dirty; and inside of the lining, the letters Tr, and a cross. Well, sir, I took them gloves away, and I showed 'em to the magistrate, over at Union Hall, before whom the case was. He says, "Wield," he says, "there's no doubt this is a discovery that may lead to something very important; and what you have got to do, Wield, is, to find out the owner of these gloves." I was of the same opinion, of course, and I went at it immediately.

I looked at the gloves pretty narrowly, and it was my opinion that they had been cleaned. There was a smell of sulphur and rosin about 'em, you know, which cleaned gloves usually have, more or less. I took 'em over to a friend of mine at Kennington, who was in that line, and I put it to him. "What do you say now? Have these gloves been cleaned?" "These gloves have been cleaned," says he. "Have you any idea who cleaned them?" says I. "Not at all," says he; "I've a very distinct idea who *didn't* clean 'em, and that's myself. But I'll tell you what, Wield, there ain't above eight or nine regular glove cleaners in London," — there were not at that time, it seems — "and I think I can give you their addresses, and you may find out, by that means, who did clean 'em." Accordingly, he gave me the directions, and I went here, and I went there, and I looked up this man, and I looked up that man; but, though they all agreed that the gloves had been cleaned, I couldn't find the man, woman, or child that had cleaned that aforesaid pair of gloves. . . .

One evening, I thought I'd have a shilling's worth of entertainment at the Lyceum Theatre to freshen myself up. So I went into the pit, at half price, and I sat myself down next to a very quiet, modest sort of young man. Seeing I was a stranger (which I thought it just as well to appear to be) he told me the names of the actors on the stage, and we got into conversation. When the play was over, we came

out together, and I said, "We've been very companionable and agreeable, and perhaps you wouldn't object to a dram?" "Well, you're very good," says he; "I *shouldn't* object to a dram." Accordingly, we went to a public house, near the theater, sat ourselves down in a quiet room upstairs on the first floor, and called for a pint of half-and-half apiece, and a pipe. Well, sir, we put our pipes aboard, and we drank our half-and-half, and sat a-talking, very sociably, when the young man says, "You must excuse me stopping very long," he says, "because I'm forced to go home in good time. I must be at work all night." "At work all night?" says I. "You ain't a baker?" "No," says he, laughing, "I ain't a baker." "I thought not," says I, "you haven't the looks of a baker." "No," says he, "I'm a glove cleaner." I never was more astonished in my life, than when I heard them words come out of his lips. "You're a glove cleaner, are you?" says I. "Yes," he says, "I am." "Then, perhaps," says I, taking the gloves out of my pocket, "you can tell me who cleaned this pair of gloves? It's a rum story," I says. "I was dining over at Lambeth, the other day, at a free-and-easy — quite promiscuous — with a public company — when some gentleman, he left these gloves behind him. Another gentleman and me, you see, we laid a wager of a sovereign, that I wouldn't find out who they belonged to. I've spent as much as seven shillings already, in trying to discover; but, if you could help me, I'd stand another seven and welcome. You see there's Tr and a cross, inside." "I see," he says. "Bless you, I know these gloves very well! I've seen dozens of pairs belonging to the same party." "No?" says I. "Yes," says he. "Then you know who cleaned 'em?" says I. "Rather so," says he. "My father cleaned 'em." "Where does your father

live?" says I. "Just round the corner," says the young man, "near Exeter Street, here. He'll tell you who they belong to, directly." "Would you come round with me now?" says I. "Certainly," says he. . . . "Good evening, sir," says I to the old gentleman. "Here's the gloves your son speaks of. Letters Tr, you see, and a cross." "Oh, yes," he says, "I know these gloves very well; I've cleaned dozens of pairs of 'em. They belong to Mr. Trinkle, the great upholsterer in Cheapside." "Did you get 'em from Mr. Trinkle, direct," says I, "if you'll excuse my asking the question?" "No," says he; "Mr. Trinkle always sends 'em to Mr. Phibbs, the haberdasher's, opposite his shop, and the haberdasher sends 'em to me." "Perhaps *you* wouldn't object to a dram?" says I. "Not in the least!" says he. So I took the old gentleman out, and had a little more talk with him and his son, over a glass, and we parted excellent friends.

This was late on a Saturday night. First thing on the Monday morning, I went to the haberdasher's shop, opposite Mr. Trinkle's, the great upholsterer's in Cheapside. "Mr. Phibbs in the way?" "My name is Phibbs." "Oh! I believe you sent this pair of gloves to be cleaned?" "Yes, I did, for young Mr. Trinkle over the way. There he is in the shop!" "Oh! that's him in the shop, is it? Him in the green coat?" "The same individual." "Well, Mr. Phibbs, this is an unpleasant affair; but the fact is, I am Inspector Wield of the Detective Police, and I found these gloves under the pillow of the young woman that was murdered the other day, over in the Waterloo Road." "Good Heaven!" says he. "He's a most respectable young man, and if his father was to hear of it, it would be the ruin of him!" "I'm very sorry for it," says I, "but I must take him into custody."

"Good Heaven!" says Mr. Phibbs, again; "can nothing be done!" "Nothing," says I. "Will you allow me to call him over here," says he, "that his father may not see it done?" . . . Mr. Phibbs went to the door and beckoned, and the young fellow came across the street directly; a smart, brisk young fellow. "Good morning, sir," says I. "Good morning, sir," says he. "Would you allow me to inquire, sir," says I, "if you ever had any acquaintance with a party of the name of Grimwood?" "Grimwood! Grimwood!" says he. "No!" "You know the Waterloo Road?" "Oh! of course I know the Waterloo Road!" "Happen to hear of a young woman being murdered there?" "Yes, I read it in the paper, and very sorry I was to read it." "Here's a pair of gloves belonging to you, that I found under her pillow the morning afterwards!" He was in a dreadful state, sir; a dreadful state! "Mr. Wield," he says, "upon my solemn oath I never was there. I never so much as saw her, to my knowledge, in my life!" "I am very sorry," says I. "To tell you the truth, I

don't think you *are* the murderer, but I must take you to Union Hall in a cab. However, I think it's a case of that sort, that, at present at all events, the magistrate will hear in private."

A private examination took place, and then it came out that this young man was acquainted with a cousin of the unfortunate Eliza Grimwood, and that, calling to see this cousin a day or two before the murder, he left these gloves upon the table. Who should come in, shortly afterwards, but Eliza Grimwood! "Whose gloves are these?" she says, taking 'em up. "Those are Mr. Trinkle's gloves," says her cousin. "Oh!" says she, "they are very dirty, and of no use to him, I am sure. I shall take 'em away for my girl to clean the stoves with." And she put 'em in her pocket. The girl had used 'em to clean the stoves, and, I have no doubt, had left 'em lying on the bedroom mantelpiece, or on the drawers, or somewhere; and her mistress, looking round to see that the room was tidy, had caught 'em up and put 'em under the pillow where I found 'em. That's the story, sir.

78. WILLIAM JONES' CASE. (CAMDEN PELHAM. *The Chronicles of Crime*. ed. 1891. Vol. II, p. 139.)

A murder, equal in atrocity, and somewhat similar in its circumstances to those of Mr. Bird and his housekeeper at Greenwich, was committed on the night of Monday, 1st January, 1828, upon the body of a woman seventy-five years old, named Elizabeth Jeffe, who had the care of an unoccupied house belonging to a respectable gentleman named Lett, and situated at No. 11, Montague-place, Russell-square.

It appears that Mr. Lett resided at Dulwich, and the house in Montague-place, which he had formerly occupied, being to let, he had placed the unfortunate Mrs. Jeffe in it to take care of it, and to exhibit its rooms to any person who might be

desirous of renting it. On the evening of Monday, the 1st January, she was last seen alive by Gardner, the potboy of the Gower Arms public house, Gower-street, who delivered a pint of beer to her, and then she was in conversation at the door with a young man, dressed in a blue coat, and wearing a white apron. On the following day the house remained closed contrary to custom, and some suspicion being entertained that something serious had occurred to cause this unusual circumstance, information was conveyed to Mr. Justice Holroyd, who resided in the same street, whose butler, with the porter of Mr. Robinson, an upholsterer, pro-

ceeded to the house. Some difficulty was at first experienced in obtaining admittance; but the back area door having been forced, the unfortunate woman was found lying in a front room on the basement story, with her throat dreadfully cut and quite dead. Mr. Plum, a surgeon of Great Russell-street, was immediately sent for, and on his arrival, he proceeded to an examination of the person of the deceased. He found that she had been dead during several hours, and that her death had obviously been caused by the loss of blood occasioned by the wound in her throat, which extended through the windpipe and gullet, and the large vessels on the right side of the neck. The handkerchief of the deceased had been thrust into the wound, but from the appearances which presented themselves, it became obvious that the foot and not the hand had been employed to place it in the position in which it was found. On the left collar bone there were some bruises, as if produced by some person's knuckles, and upon the thighs there were similar marks, as well as some drops of blood, but no wound was discovered besides that in the throat, to which death could be attributable. Upon a further inspection of the deceased's clothes, it was discovered that her pockets had been rifled; but although the kitchen drawers were open, and bore the bloody impress of fingers, and a workbasket was similarly stained, there was nothing further to show that the object of the murderer, which was evidently plunder, had been attained. The neck handkerchief and cap ribbon of the wretched woman were cut through, apparently in the effort to inflict the wound, and independently of the opinion of Mr. Plum, that the deceased could not have cut herself to such an extent, the fact of her death being caused by the hand of another was clearly shown, by the absence of any instrument with which the wound could

have been inflicted, although part of a razor case was found lying on the floor. Upon an examination of the house being made, it was found that the hall door was merely on the latch, and the furniture in the parlor presented an appearance which showed that the murderer had gone into that apartment after the death of his victim. A publication headed "The State of the Nation" was found there smeared with blood, and a doeskin glove for the right hand, on which marks of blood were also visible, was discovered lying on the floor.

From circumstances which came to light, the officers who were employed to endeavor to trace out the perpetrators of this atrocious murder, were induced to suspect that Charles Knight, the son of the deceased, was in some measure implicated in its commission. By direction of Mr. Halls, the magistrate of Bow-street, who throughout the whole case exhibited the most unremitting desire to secure the ends of justice, therefore, he was apprehended at his lodgings in Cursitor-street; but upon his being questioned, he gave a clear and unembarrassed statement of the manner in which he had been engaged during the night of the murder; an inquiry having proved this to be true, he was ordered to be discharged.

The police were now completely at a loss to fix upon any person as being open to suspicion. The man who had been seen in conversation with the deceased at the door of her house, however, appeared to be pointed at by common consent, and an accident soon pointed out a person named William Jones as the individual suspected. It was learned that he had been in the habit of calling upon the deceased at her master's residence, and that he was a seafaring man; but beyond these circumstances, and that he had been living in Mitre-street, Lambeth, nothing could be learned of him or his pursuits. On inquiry

being made at his lodgings, it was discovered that he had absconded, and the suspicion of his guilt, which was already entertained, was greatly strengthened by this circumstance. A reward of 10*l.* was offered for his apprehension, and by a remarkable accident on Monday the 13th January, he was taken into custody by a city officer, on a charge of stealing a coat. He was then taken to Guild-hall office, but Salmon, the Bow-street officer, having claimed him on this charge, he was delivered over to his custody, and by him conveyed to Bow-street. He there most strenuously denied that he was at all implicated in the murder, although he admitted that "he had done other things," but he was remanded for the production of further evidence. From subsequent inquiries, it was learned that he was the son of Mr. Stephen Jones, a gentleman well known in the literary world as the author of a dictionary called "Jones' Sheridan Improved," and as the editor of a journal published in London. This gentleman, who died only a short time before the Christmas preceding the murder, left two sons, who possessed considerable talents, but who were too much inclined to habits of dissipation. William Jones had gone to sea, but latterly, on his return, being so much straitened in his circumstances as to be sometimes in actual want, he had occasionally visited Mrs. Jeffe, who was a kind-hearted woman, and who, from the respect which she bore his family, had often relieved his necessities. At the time of his apprehension he was twenty-five years of age, and was dressed in a blue coat, as described by Gardner, the potboy, by whom he was seen talking to the deceased. Upon his subsequent examinations, the material facts which were proved against him were, that he had been living with a young woman, named Mary Parker, who generally went by the name of Edwards, in Woot-

ton-street, Lambeth; but that on the 27th of December, he suddenly removed with her to Mitre-street. During the latter part of his residence in Wootton-street, he was in extremely bad circumstances, and on the 31st of December, he and his paramour were entirely without food or money. On that night he quitted Parker in Fleet-street, and appointed to meet her at the same place at half past twelve o'clock, and at that hour he came to her, as she was standing near Serjeants' Inn, in a direction from Shoe-lane. He then had money and treated her to something to drink; and on the following morning he went out for an hour, but returned, and now produced a considerable quantity of silver money, with which they were enabled to redeem some clothes, which had been pawned, and afterwards to go to the Olympic Theatre. In the course of the ensuing week, the prisoner was observed to be anxiously endeavoring to prevent the discovery of his new residence, by going home by circuitous routes, and other means, and was heard to declare his apprehension that some officers were in search of him. But the most important circumstances proved were, first, that of the prisoner having a severe cut on his left thumb, when he was taken into custody, which appeared to have been recently inflicted; and secondly, that the razor case, which was found lying near the body of the deceased woman, had been lent to the prisoner, on the Sunday before the murder, with a razor, by Mrs. Williams, with whom he had formerly lodged. Upon proof of these facts, the prisoner was fully committed for trial; but strong as the suspicion was against him, it proved to be insufficient in the minds of the jury, before whom the case was tried, to warrant them in returning a verdict of guilty.

The case came on at the Old Bailey sessions, on Friday the 22d of February, when considerable

curiosity was exhibited by the public. The court was crowded to excess at an early hour, and its avenues were thronged until the conclusion of the proceedings. The prisoner was put to the bar at ten o'clock, and pleaded Not guilty, to the two indictments preferred against him; the first for the murder, and the second for stealing a coat, the property of George Holding. Having been given in charge

to the jury in the first case, . . . the trial terminated at twelve o'clock at night, when the jury returned a verdict of Not guilty.

The prisoner was arraigned on the next day upon the second indictment, when he withdrew the plea which he had put on the record, and confessed himself guilty. At the following sessions, held in the month of April, he was sentenced to be transported for seven years.

79. KARL FRANZ'S CASE. [Printed *post*, as No. 388.]

80. CHICAGO & ALTON R. CO. v. CROWDER. (1892. APPELLATE COURT OF ILLINOIS. 49 Ill. App. 156.)

Opinion of the Court, BOGGS, J. James Crowder, husband of the appellee, administratrix, lost his life on the 19th day of December, 1891. At the time, he was engaged in the service of the appellant company as rear brakeman on a freight train, bound south on its road. The hindmost car of the train was a caboose, having on its top, near its north, or rear end, as the train was moving, a cupola. Within the caboose a ladder extended from the floor to the cupola. Sliding windows on each side of the cupola were so arranged that persons within could pass through them, out upon the roof of the car. When, on the day named, the train was approaching, and within something less than a mile of Petersburg, the conductor, Mr. Drake, and Crowder, the deceased, were in this cupola. The conductor informed the deceased that four cars were to be set out of the train at Petersburg, and directed him to attend to the rear end of the train, while he (the conductor) went forward and got out the cars. The conductor then opened one of the windows of the cupola, stepped out upon the top of the caboose, and turning about, told the deceased to go down into the caboose and fasten the latch upon the inside of the door. Crowder immediately descended, and from the floor of the

caboose, looked up at the conductor, and said "all right." He was not heard to speak again, nor seen alive afterward.

The conductor went forward over the top of the cars to the front, or head end of the train, and remained there until the station of Petersburg was reached. When the work of setting out the cars began, he noticed that Crowder was not at his post, and soon after discovered that he was not upon the train. He walked rapidly back in search of him, and came upon his lifeless body lying upon the ground upon the east side, and within five or six feet of the railroad track. The feet of the dead man extended nearly to the track, his body at right angles with it. His head lay partly against the stump of an old piling, which projected ten or twelve inches above the surface of the ground. The skull was crushed, the stump of the old piling besmeared with blood, and brains and blood were spattered here and there upon the ground about the body, and upon the ballast of the railroad track. It was evident that the deceased had fallen or been thrown from the train; his head crushed and body mangled by striking the stump of the piling. It is estimated to be six hundred and twenty feet from the point where the caboose was, when the conductor

parted with the deceased, to the place where the body lay. One hundred and twenty-one feet north of the body, at the side of the railroad track, stood a water tank. Attached to this tank by a hinge, by the use of which it might be raised or lowered, was a hollow tube, or spout, made of heavy sheet iron, used to conduct water from the tank to the tenders of engines on the road. The appellee in an action on the case recovered in the Circuit Court a judgment against the appellant company for causing the death of Crowder, upon the theory that this spout had been negligently allowed to hang or swing so low upon its hinge that it would reach and strike a brakeman if he, when passing the tank, should be upon the top of a freight car near the edge of the roof and that the deceased came out of the cupola window upon the edge of the roof of the caboose, to discharge his duties as rear brakeman, and was struck by the spout, rendered unconscious, and caused to fall to the ground and be killed. This is an appeal from the judgment so rendered.

The duty of the deceased as rear brakeman required him to be upon the top of the car before the train reached the whistling post for the station at Petersburg. The information and directions given him by the conductor amounted to an order to discharge his duty. Hence, it may be conceded that the jury were warranted in believing he made his way from the floor of the caboose, where he was when last seen, through a window of the cupola to the roof of the car, and that he fell or was thrown from the train to the ground. It is further to be conceded that it sufficiently appears from the evidence, that the spout might have reached and struck a man of his height, had he been standing by the side of the cupola on the roof at the moment the car was passing the tank. Nothing was found upon the roof of the car or

upon the cupola indicating that he had been injured there, or even that he had been there. Nor was there mark of blood, indentation, or other indication upon or about the spout from which it could be supposed that it had come in contact with his person. A close-fitting, knit woolen cap, worn by the deceased, was found upon the ground about halfway between the tank and the body, and on the opposite side of the track. It had neither rim nor visor, fitted the head closely, and was a kind much worn by brakemen, because it could not be blown off by the wind easily, if at all. The cap was without mark, abrasion, or stain of blood, or anything to induce the belief that it had been removed from the head of the deceased by a blow or stroke of the spout. On the side of the caboose below and perhaps extending back a little beyond the cupola, several spots, supposed to be blood, were found on the morning following the unfortunate occurrence. These spots were dry and so near the color of the painted side of the car that it was difficult for the witnesses to determine whether they were spots of blood or not. One of the spots was described as being "greasy," and some of the witnesses thought it was composed of brains or flesh and blood. Spots or stains of blood were found upon the rear lower steps of the caboose. Aside from the circumstances recited and the deductions logically arising therefrom, nothing is known of the manner or the cause of the death of Crowder.

Perhaps the deductions of counsel for appellee, from these facts and circumstances, may best be made known by a quotation from their brief, viz.: "Crowder was then on the floor of the caboose and, looking at Drake, answered 'all right.' That was the last seen of him alive, and those were the last words he was heard to utter. He followed Drake out of the window to be on top when the whistle board was

reached, as is required by the rules of the company. Crowder was just in the act of getting out of the window of the cupola or had just got out, and was straightening up, when the cupola came even with the tank. The window is small, about twelve by twenty inches, or fourteen by twenty at most. He was a large man, weighing 180 pounds, and standing five feet nine inches high. His body necessarily extended considerably over the edge of the car. The spout struck him violently upon the head and knocked off his cap, which jostled to the other side of the car and fell about halfway between the tank and the place where Crowder's body was found. Crowder evidently had hold of the hand-rail on top of the cupola, as this was necessary to enable him to get out and raise himself up on the narrow margin of the roof at the side of the cupola. When the spout hit him he clutched for an instant to the rail until he lost consciousness, or was knocked over on the edge of the roof, and his body resting there an instant rolled off and struck the stump of an old piling, 121 feet from the tank, being about the reasonable and natural distance at which you would expect to find the body, taking into consideration the momentum of the body when it left the car. As he fell, or while hanging to the car, the blood which flowed in consequence of the injury from the spout, dropped down and was drawn in by the action of air to the side of the car."

Such may have been the manner of his death, but there is force in the argument of opposing counsel that many of the conclusions arrived at by counsel for appellee rest upon conjecture and speculation as to mere possibilities and probabilities. The spout *may* have come in contact with the head of the deceased and have removed his cap and inflicted a wound from which his blood flowed and dropped upon the side of the car. But, as counsel

for the appellant say, doubts of this nevertheless arise when it is remembered that no mark or stain of blood was upon the roof of the car, the cupola, the cap, or the spout of the tank; and impartial minds might accept and adopt as equally probable, the suggestion that the blood (if it was blood) upon the side and steps of the caboose, was thrown there from the body when it was dashed against the piling. That one of these spots was composed of his flesh or brains is as well shown as that any were of his blood. Is it not as reasonable to believe that this came from the body after it struck the piling where the flesh was mangled, the skull crushed, and the blood and brains of the unfortunate man scattered upon the stump, the ground and the ballast of the track, as to suppose that it came from a wound by a blow of the spout which crushed the skull so that the brain exuded and the blood flowed, and yet left no mark or stain upon the spout, the cap, the roof of the car, or cupola?

The theory advanced by counsel of the appellee as to the manner of the displacement of the cap and the injury to and fall of the deceased in the view of counsel for the appellant, is a plausible suggestion that his death might have been so caused, and yet it has no established fact in its support to inspire belief of its truth or give it weight above the other suggestions advanced by them, that the cap might have been displaced as the deceased drew his head out of the small window of the cupola, and in endeavoring to catch and retain it, he lost his balance and hold upon the handrail, the cap escaped and was carried by the wind across the top of the car to the opposite side of the track and to the place where it was found, and the unfortunate man, though struggling to keep his place upon the roof of the car, was unable to do so, and was finally thrown therefrom to the ground and killed. Or he might, though not

wounded or in any way injured, have lost his balance while out upon the roof of the car, and, in an ineffectual struggle to recover it and avert a fall, displaced the cap from his head.

The argument of counsel for the appellee, that it is entirely unreasonable to say that Crowder, an experienced brakeman, in the habit of running on the tops of cars day after day, should, in broad daylight, when the train was running at a steady gait, on a level track, with no snow or ice on the cars, lose his footing or stumble and fall from a car, seems to be answered by the argument that such an explanation of his death is the very first to arise in an impartial mind. Either one of various suppositions not inconsistent with the facts known would

account for his death, but it seems difficult to say that any one of them, more than another, finds lodgment in the mind as a belief created by the process of ascertaining unknown facts from the existence of facts that are known.

However this may be, the evidence is in another respect so clearly insufficient that we are impelled to award a reversal of the judgment. There is no proof as to the exercise of due care upon the part of the deceased. . . . There being no proof as to his acts and conduct at the time of the accident, that he was acting with due care cannot be regarded as proven. For this reason a new trial should have been granted. The judgment must be, and is, reversed, and the cause remanded.

81. TOLEDO, ST. LOUIS & KANSAS CITY R. CO. v. CLARK.
(1892. APPELLATE COURT OF ILLINOIS. 49 Ill. App. 17.) . . .

Opinion of the Court, PLEASANTS, P. J. Appellee recovered judgment below on a verdict for \$1000 damages for the loss of his right foot, charged to have been caused by the negligence of appellee. He was a single man, thirty-one years of age, residing six miles west of the city of Charleston. He went to the city on the morning of December 10, 1890, and spent the day there. About nine o'clock in the evening, on his way to take the train for home, while passing over the track of appellant on the sidewalk of Railroad street, an engine, coming from the shops, in charge of an assistant hostler as engineer and a man who worked about the shops as fireman, ran upon him and crushed his foot, which had to be amputated. He was going by the usual route from the public square to the depot. The street runs east and west, parallel with the track of the I. & St. L. Ry. and nearly parallel with that of appellant, which runs northeast and southwest, crossing the former at a point east of the place of the accident, variously stated by

the witness at eighty to a hundred and thirty feet, and the south sidewalk, diagonally, at a small angle. Appellee was walking west, carrying two bundles. His statement is, that when a few steps from the crossing, he looked north and saw the engine, then about at the crossing of the I. & St. L. track, and supposing it was moving on that track, did not look to see it again until, walking on, his foot was caught and held, beyond his power to extricate it, in a hole between appellant's south rail and the planking on its north side. The engine was moving without any headlight, at a rate of four to five miles an hour. Appellee says he heard no bell, or other warning of it. He thinks his foot went into the hole six inches. He stated that he had passed over that crossing a hundred times, probably, but never noticed it particularly, or that there was anything wrong about it; that if he had seen the hole, he could easily have stepped over it, and that if he had not stepped into it, he would have passed the crossing in ample time to avoid

the collision. On behalf of the defense it was claimed and evidence offered tending to prove that the bell was ringing; that the engine was moving, for some distance before it reached the sidewalk, so nearly alongside of him that if he had turned his eyes north, he must have seen the situation; that he was intoxicated at the time, and stupidly stepped on the crossing immediately before the collision; that the flangeway, into which he said he put his foot, was only three inches or less in width; that his shoe, on the trial, measured four; and that when the accident occurred he was wearing overshoes.

As to each of these claims, except the last two — the measurement of his shoe, and the fact that he also wore overshoes — there was evidence to the contrary. Elijah Sewell, a resident of Charleston, familiar with the crossing, and in the employ of the company as brakeman and switchman, speaking of the space between the rail and the plank, says: "The plank lays kind o' wedge fashioned with the rail, which made it five or six inches at the south end and about three at the north;" and that he made the experiment and found that his foot would slip in there. Madigan, the roadmaster, says the rail on the south side was two and a half or three inches from the plank, but varied a little where the plank was worn from the flange of the wheel. It appears, also, that there was a switch stand a few feet from the south end, and movable rails laid in the walk. Madigan says: "The two rails, I think, extend into the walk, probably a foot or so from the north side, and the movable rail from the south comes across the walk

to meet that. The switch stand is at the south side of the walk. These rails are moved by the switch stand, back and forth across the sidewalk, and when the rails are moved to the south, so as to connect with the Y, it would leave a space on the north side of the south rail of six or seven inches."

Two undisputed facts, which may have turned the scale in the mind of the jury, were that the plaintiff was on the track and only his foot was injured. The wheel that crushed it was running on the south rail — the one he would have passed first — and it is not easy to account for his injury, except upon his own statement, that finding his foot fast, he threw his body backward and outward from the track. A man stupefied by liquor to the extent it is claimed he was, usually leans and lunges forward; and had he got so far as the south rail when the engine struck him, it seems most probable that his body would have fallen between the rails, and, if his foot had not, in fact, been fast, that the falling of his body outward, before the collision, would have cleared it also. A further and fair inference would be that his injury was caused by the catching of his foot, and not by his attempt to cross the track, which would have been accomplished in a moment. The jury might well consider this frog-like arrangement of a movable rail, on a city sidewalk, faulty construction, and the leaving a space between the fixed rail and the planking, sufficient to catch and hold a foot, culpable negligence. . . . We see no material error in any ruling of the court. The judgment must therefore be affirmed.

**TITLE IV (continued): EVIDENCE TO PROVE THE
DOING OF A HUMAN ACT**

**SUBTITLE B: PROSPECTANT CIRCUMSTANCES TO PROVE THE
DOING OF A HUMAN ACT**

83. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.) It is convenient (as pointed out *ante*, No. 53) to arrange the order of evidentiary facts, when offered to prove the Doing of a Human Act, according as the indication of the evidence is Prospectant, Concomitant, or Retrospectant.

Evidentiary facts having Prospectant indications are of several sorts; the principal ones may be roughly grouped as follows: Moral Character or Disposition; Emotion or Motive; Design or Plan; Habit or Custom. The nature of the argument or inference in each instance is this: Because A had a Disposition, Habit, Emotion, Design, or Capacity to do (or not to do), an act *x*, therefore he probably did (or did not do) the act *x* alleged. Observe that the party alleging the act argues that the disposition indicates a doing of the act, while the party denying the act argues that the (opposite) disposition indicates a not doing; the nature of the argument or inference being precisely the same in both cases, the difference being in the proposition to be proved.

Topic 1. Moral Character¹

84. JAMES SULLY. *The Human Mind*. (1892. Chap. XVIII, sec. 22, p. 281.) *Moral Habitudes*. The principle of habit produces other effects in this region of conduct. The final decision after deliberation, if a rational and good one, does not need to be arrived at again and again in all similar cases. A particular exercise of self-control, say the quelling of a feeling of annoyance, or the determining to do some unpleasant duty, which, in the first instance, was the outcome of a process of reflection, will, in succeeding cases, be shortened or compressed into control without such preliminary reflection.

Here we may see that the process of self-control is becoming habitual in a new sense. Certain motives are acquiring a fixed place in the mind as ruling forces, organically connected with appropriate actions, while other and lower forces are losing ground. Every repetition of the situation calling out this particular variety of action (that is, of action having this particular motive or reason) tends to fix conduct in this direction, that is, to establish a habit of doing. The prevailing motive, for example, consideration for others, now passes into the form of a fixed inclination or active disposition. Or, to express the result another way, we may say that conduct is brought more fully under the sway of a general rule or maxim, so as to be immediately determined by the recognition of this. . . .

¹[Compare the analysis of Character and Conduct in No. 28, *ante*. — Ed.]

It is obvious from this brief account of moral habitudes that they illustrate the psychophysical process which underlies all habit. Thus veracity, with its confirmed disposition to speak the truth, implies that this particular motive or tendency is instantly called up by the appropriate circumstances, viz. the situation of being called on to state something to another. That is to say, there is an organized connection between a group of presentation complexes and an impulse to follow out a particular line of action. The perfection of the moral habitude depends on this instant excitation of the higher motive before the lower impulse, which would impede its realization, has time to assert. . . .

Volition and Character. The word "character" (from the Greek, "mark" or "stamp") is used in everyday language to mark off any sort of difference in mental or moral qualities. Thus we are wont to speak of a person's intellectual peculiarities, special tastes, and so forth, as constituents of his character. In a narrower and stricter sense the term involves a special reference to qualities belonging to the active side of the mind. Volition, in its rationalized form, conduct, being the final and most important outcome of mind as a whole, the word character has naturally come to connote in a peculiar manner those qualities, as active energy and deliberation, which go to constitute the higher type of will.

According to the more popular use of the term, every individual has his own stamp of character. This individual character is fixed partly by the peculiarities of the person's psychophysical "nature," or what we call temperament and idiosyncrasy. Thus the contrast of the volatile and fickle, and the pertinacious and obstinate temper of mind, is, as we may see from its early manifestation, a congenital difference based on certain organic peculiarities. At the same time it is evident that even individual character is a growth and as such illustrates the interaction of organism and environment. Each man's character may thus be said to be a product of particular environmental influences acting upon a particular set of congenital properties or tendencies. Such action, it is to be noted, while presupposing the existence of particular congenital tendencies, in its turn serves to select from among a whole group of such tendencies particular constituents for special developmental expansion or realization.

In addition to this everyday meaning, the word character has acquired an ethical significance. As employed in the science of ethics, it refers not to variable individual peculiarities, but to certain moral qualities which it is supposed to be the special business of social discipline and education to cultivate in all alike. In this ethical sense "character" has come to stand for "good character." This may be defined as a morally disciplined will, including a virtuous condition of the whole mind, that is, the disposition to think and feel (as well as to act) in ways conducive to the ends of morality.

We thus see that every good or moral man possesses a character in a double sense. In the first place, he has a particular group of intellectual, affective, and conative peculiarities which constitute his individual character. In the second place, he possesses certain virtuous principles and dispositions which make up the typical moral character and which assimilate him to other moral men. This moral character, though it presupposes the connate organic base of normal human development, may be spoken of as an ac-

quired product, the result of the action of that set of external influences which constitutes the educative action of a civilized and moral community upon a normal human mind.

(a) *Character as Organized Habit.* Confining ourselves now to moral character, we see at once that this consists in the possession of certain acquired tendencies or habitudes which we call virtues, — both what moralists distinguish as private ones, for example, temperance and prudence, and as public ones, such as veracity, justice, and benevolence. The excellence of the character can be estimated by the fixity and the preponderance of these virtuous dispositions. As we have seen, in all comparatively simple and recurring situations where a lower impulse is opposed to a higher motive, the degree of perfection of the moral habitude is indicated in the completeness of the control and the promptness of the right or good action. The less the disturbing force of the instinctive factor (passion, appetite), the more highly developed the character. . . . (b) *Character as Conscious Reflexion.* While, however, moral character is thus woven out of fixed habitual dispositions (Aristotle's "egeis"), it would be an error to conceive of it as merely a cluster or group of such habitudes. According to the biological view of mind, the habitual, that is, the relatively unconscious, organic process comes in only so far as environmental features and situations recur in like form, and so require similar modes of reaction. Now while it is true that the external conditions of human life, physical and social, are so far recurrent that our actions may be organized into a certain number of persistent norms or types of conduct, as thrift, temperance, fulfillment of promise, and the like, they are not so uniform in their actual, concrete combinations as to allow of our particular actions becoming in the complete sense habitual. . . . To act honestly only tends to become automatic in familiar, oft-recurring situations, as in exchanging coin for commodities over the counter of a shop: it may grow into a problem for the most patient reflexion as soon as the situation becomes exceptional, as when we discover a coin in some public place. . . .

Causes of Individual Variation. If mental development in its common typical form is a product of two factors, congenital power, and exercise of function or what we commonly call experience, we may infer that all variations depend on differences in these two factors. That is to say, every degree of general superiority or inferiority of mind, and every special modification of mental configuration, arise from certain differences in the original psychophysical constitution or in the life experience of the individual. . . . Whatever the nature and the extent of these congenital organic foundations of individuality, they have to be supplemented by our second factor, viz. functional exercise. The biologist's conception of development is that of a process of interaction between organism and environment. In order to the formation of any organic product, there must be first the requisite germ of organ, and also the appropriate stimulus to excite this to its proper functional activity. In like manner, as we have seen, mental growth is determined by environmental agencies, by the presence of certain stimuli or excitants, fitted to call forth the several psychical reactions. These external conditions vary considerably from individual to individual. In addition to the common physical environment, as determined by such circumstances as climate, locality, and so forth, there is the individual environment con-

stituted by the peculiar group of forces acting on his organism. Thus, no two children, not even members of the same family, come under precisely similar conditions of temperature, nutrition, excitation of movements, etc. The succession of sense stimuli, with their correspondent motor reactions, making up the external life experience of an infant, is a different one in every case. Still more evidently is the human environment a variable one. Even twin members of a family have an unlike social milieu in so far as the parents and others feel and behave differently towards them.

We may say, then, that individual development is the selective action of what Mr. Galton has happily called "nurture" upon "nature."

85. HANS GROSS. *Criminal Psychology*. (1911. transl. Kallen. § 13, p. 61; § 84, p. 384.) *Particular Character-Signs*. It is a mistake to suppose that it is enough in most cases to study that side of a man which is at the moment important — his dishonesty only, his laziness, etc. That will naturally lead to merely one-sided judgment and anyway be much harder than keeping the whole man in eye and studying him as an entirety. Every individual quality is merely a symptom of a whole nature, can be explained only by the whole complex, and the good properties depend as much on the bad ones as the bad on the good ones. At the very least the quality and quantity of a good or bad characteristic shows the influence of all the other good and bad characteristics. Kindliness is influenced and partly created through weakness, indetermination, too great susceptibility, a minimum acuteness, false constructiveness, untrained capacity for inference; in the same way, again, the most cruel hardness depends on properties which, taken in themselves, are good: determination, energy, purposeful action, clear conception of one's fellows, healthy egotism, etc. Every man is the result of his nature and nurture, *i.e.* of countless individual conditions, and every one of his expressions, again, is the result of all of these conditions. If, therefore, he is to be judged, he must be judged in the light of them all.

For this reason, all those indications that show us the man as a whole are for us the most important, but also those others are valuable which show him up on one side only. . . .

Nature and Nurture. Schopenhauer was the first to classify people according to nature and nurture. Just where he first used the categories I do not know, but I know that he is responsible for them. "Nature" is physical and mental character and disposition, taken most broadly; "nurture" is bringing up, environment, studies, scholarship, and experience, also in the broadest sense of those words. Both together present what a man is, what he is able to do, what he wants to do. . . .

Criminologically the influence of nurture on mankind is important if it can explain the development of morality, honorableness, and love of truth. The criminalist has to study relations, actions, and assertions, to value and to compare them when they are differentiable only in terms of the nurture of those who are responsible for them. . . . We who have had, during the growth of popular education, the opportunity to make observations from the criminalistic standpoint, know nothing favorable to its influence. If the general assertion is true that increased national education has reduced brawling, damages to property, etc., and has increased swindling, misappropriations, etc., we have made a great mistake. For the psychologi-

cal estimation of a criminal, the crime itself is not definitive; there is always the question as to the damage this individual has done his own nature with his deed. If, then, a peasant lad hits his neighbor with the leg of a chair or destroys fences, or perhaps a whole village, he may still be the most honorable of youths, and later grow up into a universally respected man. Many of the best and most useful village mayors have been guilty in their youth of brawls, damages to property, resistance to authority, and similar things. But if a man has once swindled or killed anybody, he has lost his honor, and, as a rule, remains a scoundrel for the rest of his life. If for criminals of the first kind we substitute the latter type, we get a very bad outlook.

In many countries the law of such cases considers extenuating circumstances and defective bringing up, but it has never yet occurred to a single criminalist that people might be likely to commit crime because they could not read or write. Nevertheless, we are frequently in touch with an old peasant as witness who gives the impression of absolute integrity, reliability, and wisdom, so much so that it is gain for anybody to talk to him. But though the black art of reading and writing has been foreign to him through the whole of his life, nobody will have any accusation to make against him about defective bringing up. . . . We must, of course, assume that deficiency in education is not in itself a reason for doubting the witness, or for holding an individual inclined to crime. The mistakes in bringing up like spoiling, rigor, neglect, and their consequences, laziness, deceit, and larceny, have a sufficiently evil outcome. And how far these are at fault, and how far the nature of the individual himself, can be determined only in each concrete case by itself.

Religion. The sole training on which the criminalist may rely is that of real religion. A really religious person is a reliable witness, and when he is behind the bar he permits at least the assumption that he is innocent. Of course it is difficult to determine whether he is genuinely religious or not, but if genuine religion can be established we have a safe starting point. . . . The religious statistics are altogether worthless. . . . One part is worthless because it deals only with the criminality of baptized Protestants or Catholics, and the final section, which might be of great interest, *i.e.* the criminality of believers and unbelievers, is indeterminable. Statistics say that in the country *A* in the year *n* there were punished *x* per cent Protestants, *y* per cent Catholics, etc. Of what use is the statement? Both among the *x* and the *y* percentages there were many absolute unbelievers, and it is indifferent whether they were Protestant or Catholic unbelievers. It would be interesting to know what percentage of the Catholics and of the Protestants are really faithful, for if we rightly assume that a true believer rarely commits a crime, we should be able to say which religion from the viewpoint of the criminalist should be encouraged. The one which counts the greater percentage of believers, of course, but we shall never know which one that is.

86. G. F. ARNOLD. *Psychology applied to Legal Evidence*. (1906. p. 277.) . . . [Certain legal] authors say: "The character and habit of a person is presumed to continue as proved to be at a time past. So, in an American case (*Sleeper v. Van Middlesworth*, 4 Denio 431) it was attempted to impeach the character of P, a witness. A and B who knew P four years

before when he resided at another place testify that his character was then bad. It was held that the presumption was that P's character remained the same." What we desire to point out is that the mental law is one of change and not of continuance and that it is a mistake therefore to attempt to apply such a presumption here. We are compelled to attribute continuity, to a certain limited extent, to the physical sequences of nature, because they have no purpose in view that we can understand, and in order to render our world intelligible to us, but not because there is anything in their existence per se that warrants the presumption. In the sphere of men's opinions and character there is no such necessity, for they are equally intelligible on the assumption that they change from time to time; indeed, there is nothing that a man changes more easily than his opinions. If there is any validity in the presumption that, because a man held certain opinions or was of a certain character four years ago, he does so now or is now of the same character, it is due not to continuance, but to repetition, that is, habit. It is because the opinions have been reënforced by frequently thinking in the same way and a mental disposition has thus been formed that we find them now, not of the same, but of the same kind only stronger and more fixed, for that is the legitimate conclusion. When, however, a man's habitual disposition is spoken of, it must, as Mr. Bradley says, be taken to include his environment as well as his internal feelings, etc.; you cannot separate him from his surroundings and assume they have no influence on him, nor can you truly say that if the surroundings change, the individual will remain the same. But how rarely is it that the environment does not alter? Again, a man is influenced consciously or unconsciously by his past, which is not a constant quantity, but ever changes.

It is perhaps truer of morality than of intellectual opinions that persons remain the same, for we know cases of men who, owing to their morality, by force of their habitual conduct act against what are their real opinions. But here, also, as in the sphere of opinion, so much depends on age, surrounding circumstances, change of circumstances, and the like, that the value of the presumption appears to be so slight as hardly to be worth the quoting. That character remains the same would seem to be truer of some races than others: among the Burmans it is notorious that a man may be good one year and bad the next to an extent which one hardly experiences in European countries. This is doubtless only one of the results of different education and surroundings and serves to show how little they can be neglected in estimation of character and its changes. For the character depends on the habituated self and the conditions we meet with, and as neither does this self cover our whole nature nor can we exhaust all the conditions with which we may meet, there is always the possibility of a change in character and some fresh act. It is only part of the facts which is covered by "same character and stimulus, same act." The self no doubt, especially as we grow older, becomes more and more determined and so tends to exclude more possibilities, and external conditions may become more or less permanent: but this is not enough. This fixedness is only relative, because we cannot exhaust all possible external conditions and we can never systematize the whole self.

87. ALEXANDER M. BURRILL. *A Treatise on Circumstantial Evidence.* (1868. pp. 323, 529.) *Moral character, mental endowments, and social position.*

By *moral character* is here meant the possession, habitual practice, and outward exhibition of those principles and that disposition which, united, serve most effectually to guard the mind from crime. Thus, on a charge of *theft*, a known character of unimpeached *honesty*; on a charge of riotous *assault*, a known disposition of uniform *gentleness*, severally serve to raise the suppositions of improbability most appropriate to the defense in each case. . . .

Mental endowments and attainments constitute another source of those peculiar motives which are claimed to exercise over the subject of them, an influence more than ordinarily adequate to restrain from the commission of crime. Of these it may be said, that, apart from all reference to moral qualities, they would hardly serve to guard the mind, on all occasions, from evil seductions and impulses, especially as they have been, not infrequently, found to exist in combination with utter destitution of moral principle. But, with this qualification, . . . the outward associations to which mental culture naturally leads, — the society of the wise, the good and the learned, into which it always procures admission for its possessor, and the varied connections growing out of it on every side, — serve to give double force to the restraining influences which have been enumerated.

Lastly, *station* or position in society presents another and very obvious source of restraining motives, growing out of peculiar circumstances. . . . Evidence of station has been considered by Mr. *Bentham* to be peculiarly adapted to render improbable charges of petty theft. "In any of the civilized nations of Europe," he asks, "what evidence would be sufficient to convict a prince of the blood, or a minister of state, of having picked a man's pocket of a dirty handkerchief, in a street, or in going into a play-house?" 3 Jud. Evid. 210.

But however strong the argument in this form may, in the abstract, be, it is always subject to the same practical consideration which has been applied to the other forms, already noticed; namely, that restraining motives of the class in question, and of almost the highest supposable degree of power, *have, in point of fact*, proved wholly inadequate to resist the allurements of unlawful desire, or the cogency of malignant passion. The records of the criminal courts of all nations present melancholy examples, of how high social and professional position, great mental attainments, and even apparently pure moral character, have utterly failed as safeguards against the most revolting crimes. How frequently persons of *station* have abandoned themselves to murderous impulses, is shown by such cases as those of the poisoners of Sir Thomas Overbury, Earl Ferrers, Major Strangways, Captain Goodere, and others, in England; and by some appalling examples of recent date, in the United States. That the same circumstance has not availed to deter from the commission of gainful crimes of a high grade, is proved by such cases as that of Dr. Dodd, an English clergyman of high standing, who was convicted of forgery in 1777, and underwent the extreme penalty of the law. The failure of mental attainments to hold successfully in check the murderous propensity, is signally instanced in the celebrated case of Eugene Aram. But the worst is yet to be stated: the insufficiency, namely, of even seem-

ingly high moral and *religious* character, to subdue unlawful inclination, in some of its most odious forms. . . . The assassination of Miss Reay by the Rev. Mr. Hackman, in 1779, and the shocking career of the German priest Riembauer, occur as prominent examples among others. Like the conclusions arrived at by courses of presumptive reasoning in general, the inferences deducible from evidence of character are by no means infallible, but, on the contrary, liable to more or less of error.

The great practical difficulty, subject to be encountered in the application of this species of evidence, consists in the fundamental fact that the reputation for the possession of the particular quality in question, is necessarily drawn from the *exterior* conduct alone. And it is by no means uniformly true that this exterior is the product and result of the internal causes assigned, upon the existence of which its value obviously entirely depends. It is not less true of psychological than of physical facts, that *appearances are often fallacious*. Cases have occurred and continue to occur in this country as well as abroad, in which crimes of the highest grade have, beyond the possibility of doubt, been proved against individuals, who, down to the very moment of their discovery, have borne, even among those best acquainted with them, not only good, but irreproachable characters. Men, whose reputation for uprightness in dealing has been almost proverbial, have suddenly appeared as forgers on the most extensive scale. Men, with characters for mildness and gentleness, and even the habitual observance of religious duties, have appeared as the perpetrators of atrocious murders. These instances of the apparently sudden ruin of the whole moral character, which have sometimes astounded entire communities, and are otherwise so inexplicable, become easy of explanation on the assumption that what *appeared* to be the character, and was so "reputed," was in fact a mere exterior, without any real internal foundation. The ruin has not been sudden, but the reverse. The real character, where it has ever been good, has, for some time, been secretly corrupted, and would have discovered itself sooner, had the proper occasion sooner occurred. . . .

Hence the rule, as practically laid down by the courts, that character evidence is of no force or value except in doubtful cases.

88. UNITED STATES v. ROUDENBUSH. (1832. FEDERAL CIRCUIT COURT. Baldw. 524, Fed. Cas. No. 16198.) . . . BALDWIN, J. — The accused is allowed to give evidence of his general good character, and to avail himself of it to rebut the presumption of a corrupt and criminal intention in passing the [counterfeit] paper. It is one of the great safeguards of innocence, and never fails to have a powerful influence with the jury; where there is any doubt, good character will outweigh ordinary presumptions and circumstances merely suspicious. But if the evidence is clear and convincing that the note was passed knowing it to be counterfeit, then, however bright his character may have been previous to the offense, a jury must look only to the facts and law of the case. On the same principle, evidence is permitted to be given of the character of his relatives and connections in society, and of the situation of his family; but these are circumstances which can avail him in a less degree only in cases of doubt; if the positive or circumstantial evidence of guilt leaves no doubt on their minds, a jury could not suffer such considerations to operate without violating a duty which should be

ever held sacred in courts of justice, to judge alike, and by the same rules, the high and low, the rich and poor. A defendant's standing in society gives him a right to demand from you the most favorable construction of the acts proved upon him, which the law permits to be drawn; but every dictate of public justice, the peace, interest, and safety of the community, forbid him to expect, or the jury to grant him a dispensation, if his case comes within the law. . . .

The rule of law is in a few words this: Never convict rich or poor, high or low, the good or the bad, without such proof of guilt as satisfies your minds beyond all reasonable doubt. If the character of the accused is bad, and his habits vicious, if the moral principle is impaired or extinct, and the evidence leaves you in doubt as to the motive with which the act is done, you may, and in most instances will, presume, that the intention with which the particular act is done, is in accordance with the general tenor of his character and conduct. So if the character is good, you will apply the rule in his favor; but when the evidence is clear, either way, character is out of the question; you cannot convict without, or acquit in face of, the evidence.

89. A. C. PLOWDEN. *Grain or Chaff; The Autobiography of a Police Magistrate*. (1903. pp. 224, 228.) If I have carried the reader at all with me in the desultory criticisms I have made on a Magistrate's duties, perhaps he will bear with me a little longer if I touch on certain principles which for my own guidance I have endeavored to follow on the Bench. One of these is to cultivate humility; by which I mean no more than to keep constantly in mind the fact that it is nothing but accident which distinguishes me from the man I have to judge, and which determines our relative positions. . . . Where is the man in the whole world, saint or sinner, who would not steal a loaf of bread if he were starving and if he thought he could steal it without detection?—Opportunity would make him a thief. . . .

There is another principle which I am in constant dread of forgetting, viz. never to allow yourself to be prejudiced against a prisoner by reason of his personal appearance being, in your view, unprepossessing. I am convinced there is nothing more dangerous. It is difficult to see a face for the first time without rapidly drawing from it some inference, favorable or unfavorable; but I am sure in a court of law any such instinct should be jealously watched. Nothing can mislead like the human countenance. Behind the features of a saint may lurk the hypocrisy of a scoundrel, and a face which you feel sure must be that of a confirmed criminal may really be the index of a most innocent mind. . . .

Another consideration is, that however often a prisoner may have been convicted, he may never have done anything very heinous. It is a curious feature of some criminal minds that their imagination never travels beyond the temptation, whatever it may be, that first assailed them and proved too much for their virtue. A man who has been convicted of stealing an umbrella or a watch will go on stealing umbrellas or watches without anything else tempting him in the least. It seems rather terrible to think that a man who has stolen a dozen different umbrellas on a dozen different occasions—the whole value being perhaps £5—must undergo

years of penal servitude merely because every previous conviction has to count. Quite recently I have had such a man before me. His mania — for that seems the right word for it — was to steal something, however worthless, from a public house. A stray article in the bar of a public house had for him a greater temptation than the contents of a jeweler's shop. At all events that was his record. Take the article, whatever it might be, to the window of the "public" and drop it in the street and the temptation would end. Lock in it any room of the house, and the prisoner would break the door to get at it. This is, in fact, what he had done, for he was charged with burglary as well as larceny.

90. A. G. W. CARTER. *The Old Court House [at Cincinnati]*. (1880. p. 257.)

A prosecuting attorney necessarily has a great deal of various, curious, and absolutely funny experience, and sometimes it partakes a little, if not quite, of the romantic. This romantic-serious incident occurred with me: A man was indicted by the grand jury for murder, and I duly prepared the indictment, and it was reported and delivered to the court. The prisoner was brought over from the jail, and stood up for arraignment, and while I was reading the indictment to him I recognized him, to my great surprise and astonishment, as once in bygone times a boy on account of whose bold badness and depravity, I, myself, as a boy had predicted and prophesied of him, to one of my young companions, that he would one day come to the gallows. He was not found guilty of murder in the first degree, however, but he was found guilty of the crime of manslaughter, and sent to the penitentiary for a long term of years. When I recognized him in my arraignment of him, I was at once impressed with the prediction I had made of him a score of years before, and it was with some difficulty that I proceeded in reading the indictment.

On another occasion I was engaged in reading the indictment for counterfeiting to a good-looking prisoner, on his being arraigned in court, when I recognized him as a former schoolmate of mine, and the son of one of the old citizens of this city, who in former days was very much respected, and so departed this life. The prisoner also recognized me, and it was with extreme difficulty that he could keep his erect position in the prisoner's dock, while I was arraigning him. The tears came to his eyes, and the tears came to my eyes; but official duty must be attended to, and it prevailed over feeling, and the indictment was finished and the prisoner pleaded "not guilty," and it was so recorded. But this was not all — my feelings were necessarily further tried. I had to do my duty for the State in the long and tedious trial of my former schoolmate without betraying my feelings, and this I did, and the prisoner was necessarily found guilty, for the evidence was plain and conclusive, and he was sentenced for a term of years to the penitentiary before my eyes, and sent to the penitentiary. This man when a boy was so good, and so good looking, and so amiable and effeminate, that he endeared himself to all his school companions, both boys and girls, indeed, he was loved and treated tenderly by the boys almost as a girl, and he was the last boy in the world that any one would ever have dreamed of being one day a criminal, or a convict in the penitentiary. But so it was. I of course inquired particularly into his history

as a man — having known him so well as a youth — and found out the reason of his downward course. In his young manhood he had become an excellent engraver, and was doing well in his art and trade. He married. His wife proved to be the sister of a notorious counterfeiter, and had helped her brother in his career of crime; but this was not known for a long time afterward by the victim of their wiles and coaxings. Loving his wife, and becoming a pot companion of her brother, he was persuaded to embark in the business of counterfeiting bank notes — and became the steady engraver of a band of counterfeiters extending from Maine to Louisiana. He was at last found out with the unfortunate results above detailed. Whatever became of him I know not.

91. H. L. ADAM. *The Story of Crime*. (19 —. p. 222.) . . . The burglar is a very difficult criminal to deal with, and supplies more to the ranks of the "habituals" than any other class of criminal. He rarely abandons his nefarious form of living, it seems to grow upon him, and immediately he is released from prison he sets to work to arrange another "burst" (burglary). There is a kind of brotherhood among "cracksmen," a sort of burdling fraternity, a free-masonry of mutual support, which is difficult to tackle and destroy. They seem to have banded themselves into a community which is pledged to prey upon society. . . .

Once a coiner always a coiner. That may be taken as an invariable rule. Coining seems to exercise a peculiar fascination over the "smasher," as he is technically termed. A very considerable portion of his life is spent in prison, and when he is not there he is busy making counterfeit coin, living on his own currency. . . . Let us take a more general view of these "mint prosecutions," as they are technically termed. We will take the year 1898 as an example. Of the 116 prosecutions 71 were metropolitan and 45 country. There were 14 acquittals and 102 convictions, 3 of the former and 42 of the latter being country. The convictions were divided into felonies (38) and misdemeanors (64), being the distinction between the two offenses of actual coining and the mere uttering or passing. Nearly all the felony prisoners had previous convictions against them, many of them being old offenders with bad records — living confirmations of the proverb, "once a coiner always a coiner." . . .

It sometimes happens that the police are convinced in their own minds that a certain individual is guilty of a certain crime, yet in the absence of direct evidence they are unable to arrest him. Habitual criminals get to know in time of these difficulties in the way of the prosecution, and endeavor to turn it to good account. I remember a man being charged with suspicious loitering and with having burgling implements in his possession. As each witness for the prosecution gave his evidence the prisoner took him in hand and administered a severe cross-examination. His knowledge of legal procedure was suspicious, and pointed to the fact that he must have made a good many appearances in criminal courts to have acquired it. The judge, of course, had the man's past record before him, and he looked at the jury with a peculiar twinkle in his eye, as much as to say, "Just wait a minute, gentlemen, and you will find he will say just a little too much." Which, verily, he did, for he blurted out the fact that because he was an ex-convict it did not necessarily follow that he was guilty of this

particular crime. Then the judge's smile broadened. In the end the man was convicted, and turned out to be an old jail bird with a very imposing array of previous convictions behind him.

92. **WALTER SHERIDAN'S CASE.** (ARTHUR GRIFFITHS. *Mysteries of Police and Crime*. 1898. Vol. I, p. 2.) . . .

That we are potential criminals is proved by the natural proclivities of the young. Criminal instincts, more or less strongly developed, are to be seen in all children. Anger, resentment, mendacity, destructiveness, acquisitiveness, are evil traits exhibited by most of them, although in many happily eradicated by careful education. "It is the mother's part," says Dr. Nicholson, one of our best writers on criminal psychology, "to encourage the gradual growth of inhibitory processes, such as prudence, reflection, and a sense of moral duty. . . . In proportion as this development is prevented or stifled, either owing to original brain defect or by lack of proper education and training, so there is the risk of the individual lapsing into criminal-mindedness or into actual crime." Criminals are manufactured no less by social cross purposes than by the domestic neglect which fosters the first fatal predisposition. "Assuredly external factors and circumstances count for much in the causation of crime," says Maudsley. The preventive agencies are all the more necessary where heredity emphasizes the universal natural tendency. The taint of crime is all the more potent in those whose parentage is evil. The germ is far more likely to flourish into baleful vitality if planted by congenital degeneracy. This is constantly seen with the offspring of criminals. But it is equally certain that the poison may be eradicated, the evil stamped out, if better influences supervene betimes. Even the most ardent supporters of the theory of the "born criminal" admit that this, as some think, apocryphal monster, although possessing all the fatal characteristics,

need not necessarily commit crime. The bias may be checked. It may lie latent through life, unless called into activity by certain unexpected conditions of time and chance. An ingenious refinement of the old adage, "Opportunity makes the thief," has been invented by an Italian scientist, Baron Garofalo, who has written that "Opportunity only reveals the thief"; it does not create the predisposition, the latent thievish spirit. . . .

The outside public may think that the identity of that later miscreant, "Jack the Ripper," was never revealed. So far as actual knowledge goes, this is undoubtedly true. But the police, after the last murder, had brought their investigations to the point of strongly suspecting several persons, all of them known to be homicidal lunatics, and against three of these they held very plausible and reasonable grounds of suspicion. Concerning two of them the case was weak, although it was based on certain colorable facts. One was a Polish Jew, a known lunatic, who was at large in the district of Whitechapel at the time of the murder, and who, having afterwards developed homicidal tendencies, was confined in an asylum. This man was said to resemble the murderer by the one person who got a glimpse of him — the police constable in Mitre Court. The second possible criminal was a Russian doctor, also insane, who had been a convict both in England and Siberia. This man was in the habit of carrying about surgical knives and instruments in his pockets; his antecedents were of the very worst, and at the time of the Whitechapel murders he was in hiding, or, at least, his whereabouts were never exactly

known. The third person was of the same type, but the suspicion in his case was stronger, and there was every reason to believe that his own friends entertained grave doubts about him. He also was a doctor in the prime of life; was believed to be insane or on the borderland of insanity, and he disappeared immediately after the last murder, that in Miller's Court, on the 9th of November, 1888. On the last day of that year, seven weeks later, his body was found floating in the Thames, and was said to have been in the water a month. The theory in this case was that after his last exploit, which was the most fiendish of all, his brain entirely gave way, and he became furiously insane and committed suicide. It is at least a strong presumption that "Jack the Ripper" died or was put under restraint after the Miller's Court affair, which ended this series of crimes. . . .

The regular recurrence of certain crimes and the reappearance of particular types or criminals has been often remarked upon by those who deal with judicial records; the fact is established by general experience and is capable of abundant proof. It is to be explained in part by heredity. The child follows the father, and on a stronger influence than that of mere imitateness; and these transmitted tendencies to crime can be illustrated by many well-authenticated cases, where whole families have been criminals generation after generation. There is the famous, or infamous, family of the Jukes, a prolific race of criminals, starting from a vagabond father and five of his disreputable daughters. The Jukes' descendants in less than a hundred years numbered twelve hundred individuals, all of them more or less evincing the criminal taint. These facts have been brought out by the patient investigation of Mr. Dugdale, an American scientist. An old case is recorded of a Yorkshire family,

the Dunhills, the head of which spread terror through the East Riding as the chief of a band of burglars. This Snowdon Dunhill, by name, was convicted in 1813 for robbing a granary, and sentenced to seven years' transportation. He returned from the Antipodes to earn a second sentence of exile, and his son was at the same time sentenced to transportation. One of his sisters, Rose Dunhill, was twice imprisoned for larceny; another, Sarah, had been repeatedly convicted for picking pockets, and was finally sent across the water for seven years. It may be incidentally stated as showing the contamination of evil that nearly all who came into association with the Dunhills felt the baneful influence of the family. Dunhill's wife was transported; so were Rose Dunhill's two husbands and Sarah's three. . . . There is a village in the south of Italy which has been a nest and focus of criminals for centuries. The natives are mostly related to each other by intermarriage, and all seem bound by tradition to prey upon their fellows. Again, in the Madras Presidency, at Trichinopoly, a whole caste of thieves existed, one and all vowed to various kinds of crime, and the practice of crime by certain Indian tribes generation after generation is well known to Indian police officers. . . .

I propose to show now from a number of selected cases how thieves, swindlers, depredators, murderers, and all kinds and classes of criminals who make mankind their prey, have been reproduced again and again. . . . The sharper follows out his long career of successful fraud and imposture century after century. Such men as Hatfield, Collet, Coster, Sheridan, Benson, Shinburn, 'Almeyer, are the seemingly inevitable recurrence of one and the same type. . . .

Walter Sheridan. — One of the most successful of modern criminal adventurers has been the American, Walter Sheridan, who was said to be

the originator of the Great Bank of England forgeries for which the Bidwells were afterwards punished. . . . Sheridan is a typical modern criminal, having great natural gifts, unerring instincts in divining profitable operations, uncommon quickness and astuteness in planning details and executing them. No one has better utilized to his own advantage the numberless chances offered by the intricate machinery of modern trade and finance. He began in the lower lines of fraud. Full of an evil, adventurous spirit, he ran away from his home, a small farm in Ohio, when only a boy, resolved to seek fortune by any means in the busy centers of life. St. Louis was his first point; here he at once fell into bad company, and became associated with desperadoes, especially those engaged in the confidence trick. But in 1858, when just twenty, he was caught and tried for horse stealing, and just before sentence escaped to Chicago, where he became the pupil of a certain Joe Moran, a noted hotel thief, with whom he worked the hotels around very profitably for two or three years, but was at last arrested and "did time." On his release, Moran being dead, Sheridan took up a higher line of business and became a "bank sneak," the clever thief who robs banks by bounce or stratagem, being greatly aided in the business by a fine presence and insinuating address. He was the life and soul of the gang he joined, the brains and leader of his associates, and his successes were many in this direction. With two confederates he robbed the First National Bank, of Springfield, Illinois, obtaining some \$35,000 from the vaults. Next he secured \$50,000 from a fire insurance company. Again \$37,000 from the Mechanics' Bank of Scranton. A very few years of this made him a rich man, and he was supposed to be worth some £15,000 to £20,000 by 1867. He had gone latterly into

partnership with the notorious George Williams, commonly called "English George," a well-known depredator and bank thief. About this time he participated in the plunder of the Maryland Fire Insurance Company of Baltimore, and fingered a large part of the \$75,000 taken, in money and negotiable bonds, not one cent of which was ever recovered. One of his neatest thefts was the relieving of Judge Blatchford, of New York, of a wallet containing \$75,000 worth of bonds. Misfortune overtook him at last, and he failed in his attempt to rob the First National Bank of Cleveland, Ohio, in 1870. One of his confederates had laid hands on \$32,000, but was caught in the act of carrying off the packages of notes, and Sheridan was arrested as an accomplice. He was very virtuously indignant at this shameful imputation, and his bail was accordingly accepted for \$7000, which he at once sacrificed and fled. But now the famous Pinkerton detectives were put upon his track. Allan Pinkerton, who was assisted by his son William, soon ascertained that Sheridan owned a prosperous hotel at Hudson, Michigan. . . . Sheridan about this time came in person to his hotel to visit his relatives. The Pinkertons did not lay hands on him here among his friends, but they shadowed him closely when he moved on, and by and by captured him at Sandusky, Ohio. He was taken to Chicago, but made a desperate attempt to escape, which was foiled, and he was eventually put upon his trial. He retained the very best legal advice, paid large sums — no less than £4000 — in fees, and was eventually acquitted through the clever use of technicalities in the law. Sheridan, after this narrow escape from well-merited retribution, went "East," and organized fresh depredations in new localities. They were often on the most gigantic scale, thanks to his wonderful genius for evil. The rob-

bery of the Falls City Tobacco Bank realized plunder to the value of £60,000 to his gang, and Sheridan, now at the very pinnacle of his criminal career, must have himself been worth quite £50,000.

In these days he made a great external show of respectability, and cultivated good business and social relations. They aided him in the still larger schemes of forgery on which he now entered, the largest ever known in the United States, and which comprised the most gigantic creation of false securities and bonds. It was an extraordinary undertaking, slowly and elaborately prepared. . . . It is generally believed that the total losses incurred by the companies and institutions on whom Sheridan forged amounted to nearly a million of money. Many Wall Street brokers and a number of private investors were ruined utterly by these wholesale frauds. A little before the discovery Sheridan quietly gathered all his assets together, divided the spoil, and crossed to Europe, carrying with him £40,000 worth of the forged bonds, some of which he put upon the European markets. . . . But he could not keep away from America, and he

presently went back to his fate, which was the entire loss of his ill-gotten gains. Under the name of Walter A. Stewart, he turned up at Denver as a florist and market gardener doing a large business. He presently established a bank of his own and was caught by the speculative mania; he took to the wildest gambling in mining stock, and by degrees lost every penny he possessed. After this it was believed that he would organize a fresh series of forgeries, and he was closely watched by the Pinkertons. They arrested him as he landed from the Pennsylvania ferryboat. He was brought to trial on no less than eighty-two indictments, including the New York forgeries, and was sentenced to five years' imprisonment in Sing Sing. After that he was again arrested for stealing a box of diamonds, and yet again, as John Holcom, for being in possession of counterfeit United States bills. He received two fresh sentences, following one close on the other, and, as his health was already failing when last apprehended, it is probable that he did not long survive. Now, at any rate, the curtain has fallen upon him and his criminal career.

93. THE POSTMAN'S CASE. *cacy*. Amer. ed. 1892. p. 204.)

A postman was indicted for stealing a shilling. A second indictment charged him with obtaining it by false pretenses, with intent to defraud. This was the charge upon which he was tried.

Evidence: He received as a letter carrier on the 10th of April from the post office, a letter to deliver on his ordinary round. It was directed "Miss Brown, No. 50 Graham street." The letter was a soldier's letter from Zululand, and was entitled to come post free. The prisoner inquired of a Mrs. Smith where Miss Brown lived, as she had removed from No. 50. Mrs. Smith would show him. The prisoner

(RICHARD HARRIS. *Hints on Advo-*

said, "There is a shilling to pay." Some one, but not the post-office authorities, had marked the letter one shilling in pencil; evidence tended to prove prisoner had marked it himself.

Mrs. Smith took the prisoner to a Mrs. Jones and said that was where Miss Brown had removed to. On arriving, Mrs. Smith said to Mrs. Jones, "Here is a letter for Miss Brown and there is a shilling to pay," whereupon the prisoner handed in the letter and received the shilling; Mrs. Jones remarking that Miss Brown would be only too glad to pay the shilling, for "the letter was one she was expecting from her brother

from the wars." Mrs. Smith said jocularly, "Let us spend the shilling." "No," answered the conscientious postman, "it does not belong to me, I have got to pay it in."

Both these witnesses knew the prisoner; and the would-be spendthrift, Smith, knew him well, as would seem from her familiarity. A day or two after, the prisoner was on his round and again saw the witnesses, whom one might not irreverently call the "merry wives," and Miss Brown. Mrs. Smith said, "This is the postman who brought that letter from Zululand." "Yes," answered the prisoner, "and if it hadn't been for me she would never have had it at all, for it had been kicking about for several days."

The prisoner was identified by several witnesses, by a whole population one might say. It was a Government Prosecution.

Two months after, in consequence of Miss Brown reporting to the post-office authorities the circumstances above stated, a letter was addressed by them to the prisoner calling his attention to the facts and asking for an explanation.

The prisoner replied (and his letter was in evidence), that, undoubtedly, he must have been on that district at the time and on the particular delivery when the letter was given out, but he had no recollection of it at all, and certainly *never received the shilling*. This absolute denial of receiving the money was the awkward point in the case. The post-office sheets were produced to prove the non-payment over by the prisoner.

This was the case for the prosecution, except the witnesses to identify; and certainly, on paper, it looks a somewhat hopeless one to defend.

The counsel for the defense commenced cross-examining as to identity; the prosecution having taken trouble to call so many witnesses to this point, it was worth disputing, as you will see. It was made the

chief point on behalf of the Crown. If they established that, all other defenses seemed hopeless — so they established it. . . . It was cross-examined to so far as two or three witnesses were concerned and then dropped.

The points elicited in cross-examination were these:

1. The letter had been given out by the post-office authorities on the morning in question without being stamped — an *oversight* on their part.

2. There was another oversight on the part of the authorities at another post office with regard to the same letter.

3. There was nothing to show it was a soldier's letter and entitled to come free.

4. The prisoner might under the circumstances have thought a shilling was due upon it, which would be the postage from Zululand.

5. If he had charged a shilling and then paid it over, it would, although irregular, have been the right and proper thing to do.

6. The sheet for the 11th of April was not produced, and although the shilling did not appear in the pay sheet of the 10th, the witness would not absolutely swear it was never paid in. (Probabilities, however, strong the other way, inasmuch as prisoner said *he had never had it*.)

7. The post office was sometimes guilty of oversights, and the failure to enter the shilling might have been one.

8. The prisoner might by an oversight have omitted to pay it over.

9. His attention was not called to the circumstances till two months after.

10. Multitudes of letters, some requiring payment, others not, had passed through his hands since that time.

11. His frank avowal that he must have received the letter but did not remember the circumstances. . . .

The real question was, whether the accused, who bore a most excellent character, and had been in the service of the post office for ten years, had received the shilling *with intent to defraud*, or whether he had received it and forgotten to pay it over, or whether indeed he may not even have paid it over and its entry be on some other sheet. It was not probable that a young man with so valuable a character would sell it for a shilling.

Witnesses to the young man's goodness were called, and the jury without hesitation acquitted. Those minor incidents and trifling theories, which looked so insignificant while they were being blown about by a breezy cross-examination, took root at last, nevertheless, and grew to be such great probabilities, under the ripening influence of a warm and genial speech. And then character lit them all up with such pleasant sunshine that the jury could never look on the dungeon shadows again — and so acquitted.

This was at first a dreadfully woe-begone case to look at; but where character is to be had, bad cases in appearance are scarcely ever altogether hopeless. And it might be

here remarked that in calling witnesses to character, it is better, in my opinion, to call many than few. One snowflake may not be whiter than another, but an accumulation of flakes gives weight and consistency, and sometimes irresistibility. It is often said by the judge, "You cannot carry character any higher, Mr. Jones, can you, if you call twenty?" No, my lord, not so far as your logical mind is concerned; and to your lordship the forty-seventh proposition might be abundantly clear by the ordinary process of demonstration; but the jury might like to see the two squares measured and cut up, and placed on the big one. How, then, my lord? In that case I would say, call your witnesses; two or three of them may not have made much impression, but here comes one between whom and some of the jury there may be a bond of sympathy or good-fellowship, or of some other equally excellent material; and they may attach very great weight to his opinion, and very little to the opinion of some of the others. I would therefore say, *call all your witnesses to character*, — especially if you have got nothing else to rely upon.

94. THE SELF-SACRIFICING BROTHER'S CASE. (ANON. *Green Bag*. 1891. Vol. III, p. 8.)

Years ago (said one of the well-known members of the Louisville Bar), I was called on to defend a man of nearly middle age, who was accused of having stabbed a man in a quarrel on the street. Imagine my astonishment when at the first consultation he told me these facts: "Yesterday afternoon," said he, "about dusk, my brother, who resembles me somewhat, was crossing the street, when he met a stranger coming the other way. The crossing was muddy, the stranger jostled him, and a quarrel ensued that developed into a fight, in which my brother, who had his pen-knife in his hand, stabbed his opponent several times,

and then ran away as a policeman and several citizens came up. After we were all in bed last night, the officers came to the house after the assailant; and much to my surprise, the warrant was made out against me. My brother is a man of dissipated habits, who has several times been in trouble; and if this case is pressed against him I am afraid he will be sent to the penitentiary. On the other hand, I am a law-abiding citizen, and can prove an excellent character. Now, what I propose to do is to stand trial on this charge, plead not guilty, prove an alibi, — as I can, — prove my character, and take the conse-

quences. If I am convicted, I may get off with a fine, and I am willing to pay that to keep my brother out of prison." I tried to persuade my client out of such a romantic proceeding; but he was determined, and in order to do him justice in the defense, I obtained the assistance of another lawyer, who did not know the facts, and would act in the defense as if our client were guilty. Well, the case came up. My client was identified by the man who had been stabbed and by the policeman and other disinterested parties who had witnessed the fight in the semidarkness and were sure of their man, as they thought. My client swore that he did not commit the assault, but that he was at home at the time when it occurred; and his family swore to that fact. Then several leading mem-

bers of the church testified as to his good character. But the jury found him guilty and fined him fifty dollars. He paid it without a murmur, and the record of his conviction stands in the orders of the court. All through the trial my client's guilty brother sat by his side in the court and heard the testimony without flinching. I asked him what he would have done if his self-sacrificing brother had been sentenced to the penitentiary. "I intended in that event," said he, "to get up in court and acknowledge my own guilt."

The other lawyer was thunderstruck after the trial, when I told him the facts. He refused to believe it, and said the evidence was sufficient to convict any man who lived. Only the proof of good character saved the accused from a severe sentence to the state prison.

95. **EUGENE ARAM'S CASE.** (*CAMDEN PELHAM. The Chronicles of Crime.* ed. 1891. Vol. I, p. 168.)

This is perhaps the most remarkable trial in our whole Calendar. The offender was a man of extraordinary endowments and of high education, and therefore little to be suspected of committing so foul a crime as that proved against him. Much has been written upon the subject of this murder, and attempts have been made, even of late years, to show the innocence of Aram. The contents of the publications upon the subject would be sufficient of themselves to fill our volumes. . . . The peculiarities of the case are twofold; first, the great talents of the offender, and, secondly, the extraordinary discovery of the perpetration of the murder, and of the evidence which led to the conviction of the murderer. . . . That a man possessing powers of intellect so great should have been guilty of such a crime as that which he committed, seems most extraordinary.

Eugene Aram was born at the village of Netherdale, in Yorkshire, in the year 1704, of an ancient and

(*CAMDEN PELHAM. The Chronicles*

highly respectable family; but although it is shown by the chronicles that one of his ancestors served the office of high sheriff in the reign of Edward the Third, it appears that at the time of the birth of Eugene, the vicissitudes of fortune had so far reduced its rank, that his father was compelled to support himself and his children by working as a gardener in the house of Sir Edward Blackett. . . . Eugene was employed as an attendant upon that gentleman, and he early displayed a taste for literature, which was fostered and supported by his indulgent master. His disposition was solitary, and every leisure hour which presented itself to him was devoted to retirement and study; and in the employment which good fortune had bestowed upon him, ample opportunities were afforded him of following the bent of his inclinations. He applied himself chiefly to mathematics, and at the age of sixteen he had acquired a considerable proficiency in them. . . . The politer

subjects of poetry, history, and antiquities next engaged his attention. Every day served to increase the store of knowledge which he possessed, and his fame as a scholar having now extended to his native place, he was invited to take charge of a school there. The means of study and of profit appeared to him to be thus united, and he immediately accepted the offer which was made; and after a short time he married a young woman of the village, to whom he appeared tenderly attached. To this marriage, however, which proved unhappy, he attributed all his subsequent misfortunes; but whether with truth or not, the course of the narrative does not distinctly disclose. His deficiency in the learned languages now struck him, and he immediately set about conquering the difficulties which presented themselves in this new field of research; and so rapid was his progress, that ere a year had passed, he was able to read with ease the less difficult of the Latin and Greek historians and poets. In the year 1734 an opportunity was afforded him of adding a knowledge of the Hebrew language to his list of acquirements; for in that year Mr. William Norton, of Knaresborough, a gentleman of great talents, who had conceived a strong attachment towards him, invited him to his house, and afforded him the means necessary for pursuing its study. He continued in his situation in Yorkshire until the year 1745, when he again visited London, and accepted an engagement in the school of the Rev. Mr. Plainblanc, in Piccadilly, as usher in Latin and writing; and, with this gentleman's assistance, he acquired the knowledge of the French language. He was afterwards employed as an usher and tutor in several different parts of England; in the course of which, through his own exertions, he became acquainted with heraldry and botany; and so great was his perseverance, that he also learned the Chaldaic and Arabic

languages. His next step was to investigate the Celtic in all its dialects; and, having begun to form collections, and make comparisons between the Celtic, the English, the Latin, the Greek, and the Hebrew, and found a great affinity between them, he resolved to proceed through all those languages, and to form a comparative lexicon.

Daniel Clarke was a shoemaker, living at Knaresborough; and it appears that this unfortunate man, having lately married a woman of a good family, industriously circulated a report that his wife was entitled to a considerable fortune, which he should soon receive. Aram and Houseman, in consequence, conceiving hopes of procuring some advantage from this circumstance, persuaded Clarke to make an ostentatious show of his own riches, in order to induce his wife's relations to give him that fortune of which he had boasted. It is not impossible that in giving their subsequent victim this advice, they may at the time have acted from a spirit of friendship. . . . Clarke, it seems, was easily induced to comply with a hint so agreeable to his own desires; and he borrowed, and bought on credit, a large quantity of silver plate, with jewels, watches, rings, etc. He told the persons of whom he purchased, that a merchant in London had sent him an order to buy such plate for exportation; and no doubt was entertained of his credit till his sudden disappearance in February, 1745, when it was imagined that he had gone abroad, or at least to London, to dispose of his ill-acquired property. Whatever doubt may exist as to the original intention of the parties, their object at this time is perfectly clear, and there can be no hesitation in supposing that Aram and Houseman had at this time determined to murder their dupe, in order to share the booty. On the night of the 8th February, 1745, they persuaded Clarke to take a

walk with them, in order to consult upon the proper method to dispose of the effects; and, engaged in the discussion of this subject, they turned into a field, at a small distance from the town, well known by the name of St. Robert's Cave. On their arrival there, Aram and Clarke went over a hedge towards the cave; and when they had got within six or seven yards of it, Houseman (by the light of the moon) saw Aram strike Clarke several times, and at length beheld him fall, but never saw him afterwards.

These were the facts immediately connected with the murder, which were proved at the trial by Houseman, who was admitted King's evidence; and, whatever were the subsequent proceedings of the parties in respect of the body, they must remain a mystery. The murderers, going home, shared Clarke's ill-gotten treasure, the half of which Houseman concealed in his garden for a twelvemonth, and then took it to Scotland, where he sold it. In the meantime Aram carried his share to London, where he sold it to a Jew, and then returned to his engagement with Mr. Plainblanc, in Piccadilly. Fourteen years afterwards elapsed, and no tidings being received of Aram, it was concluded that he was dead; and these fourteen years had also elapsed without any clew being obtained to unravel the mystery of the sudden disappearance of Clarke.

The time at length came, however, at which all the doubts which existed upon both subjects were to be solved. In the year 1758, a laborer named Jones was employed to dig for stone in St. Robert's Cave, in order to supply a limekiln at a place called Thistle Hill, near Knaresborough; and having dug about two feet deep, he found the bones of a human body, still knit together by the ligaments of the joints. It had evidently been buried double; and there were indications about it which could not but lead

to the supposition that some unfair means had been resorted to in order to deprive the living being of life. The incident afforded good grounds for general curiosity being raised, and general inquiry taking place; and hints were soon thrown out that it might be the body of Clarke, whose unexpected disappearance was still fresh in the memory of many, and whose continued absence had been the subject of so much surprise. Suggestions of his murder which had been thrown out by Aram's wife were called to mind, and a coroner's inquest being held, she was summoned. By this time a general impression prevailed that the remains found were those of Clarke, and the testimony of Mrs. Aram greatly confirmed the idea which had gone abroad. She deposed that she believed that Clarke had been murdered by Houseman and her husband, and that they had acquired considerable booty for the crime; but she was unable to give any account of her husband, or to state whether he still was in existence or not. Inquiries being made, however, Houseman was soon found; and on his being brought forward to be examined, he exhibited the utmost confusion. The coroner desired that he would take up one of the bones, probably with a view of seeing what effect such a proceeding would produce; and upon his doing so, he showed still further terror, and exclaimed, "This is no more Daniel Clarke's bone than it is mine!" The suspicions which were already entertained of his guilt were, in a great measure, confirmed by this observation; and it was generally believed that he knew the precise spot where the real remains of the murdered man were deposited, even if he had not been a party to their interment. He was therefore strictly questioned; and after many attempts at evasion, he said that Clarke was murdered by Eugene Aram, and that his body was buried in St. Robert's Cave,

but that the head lay further to the right in the turn near the entrance of the cavern than the spot where the skeleton produced was found. Search was immediately made, and a skeleton was found in a situation corresponding exactly with that which had been pointed out. In consequence of this confession an inquiry was immediately set on foot for Aram, and after a considerable time he was discovered, occupying the situation of usher in a school at Lynn in Norfolk.

He was immediately apprehended and conveyed in custody to York Castle; and on the 13th of August, 1759, he was brought to trial at the assizes before Mr. Justice Noel. . . .

Aram's defense was both ingenious and able, and would not have disgraced any of the best lawyers of the day. It is a curious and interesting address, and we subjoin it as affording the best criterion of the talents of the prisoner which can well be adduced. He thus addressed the court:

"My lord, — I know not whether it is of right or through some indulgence of your lordship that I am allowed the liberty at this bar, and at this time, to attempt a defense, incapable and uninstructed as I am to speak; since, while I see so many eyes upon me, so numerous and awful a concourse fixed with attention and filled with I know not what expectancy, I labor not with guilt, my lord, but with perplexity; for having never seen a court but this, being wholly unacquainted with law, the customs of the bar, and all judiciary proceedings, I fear I shall be so little capable of speaking with propriety in this place, that it exceeds my hope if I shall be able to speak at all.

"I have heard, my lord, the indictment read, wherein I find myself charged with the highest crime, with an enormity I am altogether

incapable of; a fact, to the commission of which there goes far more insensibility of heart, more profligacy of morals, than ever fell to my lot; and nothing possibly could have admitted a presumption of this nature but a depravity not inferior to that imputed to me. However, as I stand indicted at your lordship's bar, and have heard what is called evidence adduced in support of such a charge, I very humbly solicit your lordship's patience, and beg the hearing of this respectable audience.

"My lord, the whole tenor of my conduct in life contradicts every particular of the indictment: yet had I never said this, did not my present circumstances extort it from me, and seem to make it necessary. Permit me here, my lord, to call upon malignity itself, so long and cruelly busied in this prosecution, to charge upon me any immorality of which prejudice was not the author. No, my lord, I concerted no schemes of fraud, projected no violence, injured no man's person or property. My days were honestly laborious, my nights intensely studious; and I humbly conceive my notice of this, especially at this time, will not be thought impertinent or unseasonable, but, at least, deserving some attention; because, my lord, that any person, after a temperate use of life, a series of thinking and acting regularly, and without one single deviation from sobriety, should plunge into the very depth of profligacy precipitately and at once, is altogether improbable and unprecedented, and absolutely inconsistent with the course of things. Mankind is never corrupted at once. Villainy is always progressive, and declines from right, step by step, till every regard of probity is lost, and every sense of all moral obligation totally perishes."

96. LEOPOLD REDPATH'S CASE. (D. MORIER EVANS. *Facts, Failures, and Frauds.* 1859. p. 432.)

One of the most extraordinary instances of successful swindling, combined with a high moral reputation and a truly benevolent career, is that of Leopold Redpath. Never was money obtained with more wicked subtlety; never was it spent more charitably. The thief and desperate criminal were so intertwined with the philanthropist, that his character presents an admirable study for the metaphysician. A greater rogue, so far as robbery is concerned, it were difficult to find; nor a more amiable and polished benefactor to the poor and the friendless. . . .

The earlier antecedents of Redpath's career present no features of unusual interest. . . . He received a fair education, and evinced good taste in artistic matters, the latter subsequently displayed with reckless extravagance. He possessed also sound information on ordinary topics, and a good capacity for business. Having no friends to push him onward in life, he had to struggle successively with difficulties which fall to the common lot. . . . On the starting of the Peninsular and Oriental Steam Navigation Company, Redpath secured the position of clerk in the establishment. His salary was a fair one, but not adequate to Redpath's now growing ambition. . . . Leaving the Peninsular and Oriental Company, Redpath struck out into a new field on his own account and set up business as an insurance broker in Lime Street, City. And now began that career of spurious philanthropy and affected piety which is so remarkable a feature in his character. His house at Blackheath soon became known as the residence of a gentleman whose name might be reckoned on for addition to any charitable subscription list. Highly moral in his external character, affecting a veneration for religion

which he never felt, he was regarded as a model man. An ardent advocate of every benevolent scheme which was set on foot, he became also a willing supporter of it. . . . He was ambitious to be talked of as a kind-hearted, benevolent, charitable gentleman, whose hand, heart, and purse were ever open. And all this time he was trading in philanthropy with the capital of others. With an affable blandness of demeanor he gave away the property of his creditors, for his career as an insurance broker was a short one. Being more generous than just, in less than three months he became a bankrupt, with liabilities to the extent of £5000, and assets a mere nothing. . . . The auctioneer's inevitable hammer cruelly struck down his suburban establishment, and swept away the luxuries and refinements of his home. But Redpath was not the man to be crushed by an auctioneer's hammer. At the age of about thirty-five he obtained the appointment of clerk in the service of the Great Northern Railway Company. His first situation here was quite a subordinate one . . . as assistant to the registrar, Mr. Clarke.

How soon after his appointment Redpath entered on that reckless path of crime which led him to ignominy and isolation from his fellow men, is not accurately known; but it is certain that he speedily resumed that luxurious style of living which was the acme of his ambition. . . . Meanwhile, his principal, Mr. Clarke, had retired from his position as registrar, and Redpath reigned in his stead. The directors did not place him there without reason. He had already proved himself adequate to the situation, and had devoted himself to the duties of the department with assiduity. The moment he had secured the control of the department, he rushed for-

ward desperately in his career of crime. His previous frauds — supposing that he had committed any — were very trivial to those he now practiced. Looking back upon the trickery of this consummate rogue, it seems scarcely credible that his crimes should have been so easily perpetrated, and should have remained so long undiscovered. But Redpath was a clever swindler, and the directors were unsuspecting. His facilities for the commission of robbery were great, and he used them with diabolical skill. . . . The mode in which the extensive forgeries were committed was this. It was subsequently shown, for instance, that a deed, No. 3623, was forged, the amount represented being £312 10s. This deed would have entitled a Mr. John Morris, of Manningtree, to transfer his interest in that stock, had he gone with it to a stockbroker. The person purporting to attest was a gentleman named Shaw, represented by the deed to belong to the same neighborhood. The transfer was made by Redpath to his own name, and sold through his own stockbroker, the forger receiving the amount represented. On the trial, Mr. Henry Atterbury, a clerk in the Great Northern Railway Company, thus testified to the system of fraud referred to: "I produce a transfer, dated May 7, 1852, the number of which is 3623, and it purports to be a transfer from John Morris to William Henry Hammond, of £312 10s. of the B stock of the company. In this entry, the names of Morris, the transferer, and that of Timothy Shaw, the attesting witness, are, I believe, in the handwriting of the prisoner Redpath. . . ." The witness then detailed other entries in which the name of Morris and of the subscribing witness were in the prisoner's handwriting; the result of his evidence being to show that the total amount of the fraudulent entries upon both sides of Morris's account alone, was £17,600. But

Redpath was quite a connoisseur in the art of forgery, and had more methods than one. Another mode of robbery was elicited in evidence on the trial. Redpath purchased in April, 1853, two separate amounts of stock of £500 and £250 respectively. The sellers duly transferred them to him, and they were entered to his credit in the register. It should be observed, that when a transfer is made and registered, the buyer receives a certificate, termed a coupon, for the amount of stock transferred. This coupon is signed by the transfer clerk; it is then supposed to be compared with the original transfer, and with the entry in the registry, by the secretary, who countersigns it; and it is then delivered to the purchaser of the stock, as his evidence of title. In Redpath's case it was found that he had placed a figure of 1 before each of the above-named amounts, converting them into £1500 and £1250, respectively, thus creating £2000 of A stock in his own favor. Fifty-two transfers were thus made into his own name, and ten out of it. Now although he had falsified the register, the coupon would not tally with it, and as the coupon must accompany the transfer in selling the stock, that had also to be altered. . . . Redpath now saw a perfect Golconda before him, that required very little labor; and, in some respects, very little skill to work. . . .

How the thousands thus easily acquired were disbursed, is a very interesting study. It was not squandered in giddy dissipation. Redpath kept no mistress; he was never known to gamble; the gentry of the turf found no easy prey in him. No, he was a respectable man — a highly respectable man. . . . Nor was this character apparently undeserved. It must be confessed, that to his other qualifications Redpath added the tact of the consummate actor. He thoroughly deceived the world; nay,

his life was so far an acted lie, that it may well be believed that he even deceived himself. . . . His house in Chester Terrace was magnificently furnished with everything that a luxurious ambition in middle life could desire, and with all that a refined taste could suggest. Here he set up his carriage, keeping a groom as well as a coachman. The arrangements of his household were on a liberal scale — the liberality that disburses other people's money. A butler superintended his cellar of choice wines; a footman awaited his lightest wants; and five or six female domestics shared in the splendor of his residence. . . . But the pleasures of the table and of refined company were not the only delights in which Redpath indulged. With him charity was an amusement, a passion, and a source of patronage which brought him flattery and fair friends. Persevering secretaries found in him a pliant gentleman, who was ever ready to place his name upon the subscription list for a new church, a fancy bazaar for a school, or a fund for an orphan or widow. He was, amongst other positions, a governor and one of the managing committee or almoners of Christ's Hospital, and a governor of the St. Ann's Society, an admirable institution for the children of those once in prosperity. . . . There was, doubtless, much ostentation in all this; for to believe that a man who was daily engaged in craftily forging transfer deeds for the sake of wealth, could be constantly actuated by the generous feeling of true charity, is to believe a sham. Redpath's was a spurious charity, a hollow mockery of benevolence. And yet it is hard to suspect that the genuine warmth of true benevolence did not sometimes actuate his movements. He has been known to seek out some poor widow who was trying to get her boy into a school, sympathize with her struggles, and generously relieve her necessities in so kind a way as to

make the mother's heart to leap for joy. . . . Thus was this anomalous double life pursued, forgery and fraud keeping pace with luxury and benevolence. The directors of the Great Northern Railway Company were unsuspecting of the real sources of his wealth. Their clerk had the reputation of a successful speculator, and the salary which he received was supposed to be regarded by them as merely another string to his bow. . . .

An incident occurred, however, which suddenly startled them into a knowledge of the reckless extravagance of Redpath's life. Mr. Denison, the chairman of the line, was standing on a station platform, conversing with Lord D——, when Redpath happened to come up, and lifted his hat to Mr. Denison. The nobleman, however, was on easier terms. Taking Redpath cordially by the hand, "Ah, my dear fellow," said he, "how are you?" Having parted, the chairman turned to Lord D——, and asked what he knew of their clerk. "Oh," said he, "he is the jolliest fellow in life; he gives the most sumptuous dinners and capital balls that I know of." This was an ominous rencontre for Redpath; and, coupled with the then agitated state of the shareholding community, it was determined to scrupulously examine the books of the company. This course once decided, it was deemed advisable to begin the investigation from an early date, and a distinct department was created for the purpose. The officials instructed to carry out this process first met on November 15, 1856. A day or two after, when the actual inquiry was being commenced, Redpath came into the room, and asked what they were going to do. "To go through all the accounts," said the head of the department, "from the commencement of the company." "That is perfectly useless," said the thunderstricken Redpath, smothering his emotion; "you

will find all the accounts right in the gross, and it is of no use entering into special details." Finding this feeble remonstrance unavailing, and not daring, of course, to urge the matter, Redpath carelessly took up a book and threw it down again, remarking, "Well, if that is your intention, I will have nothing to do with it; and if this course is persevered in, I shall resign." He then made some excuse to leave for a few minutes. He went, but never returned. . . .

They found the accomplished forger, sitting at breakfast, between ten and eleven, and he was immediately given into custody. . . . On the morning of Thursday, January 15, 1857, the Central Criminal Court was densely crowded. . . . Mr. Serjeant Parry, for Redpath, endeavored to show that he had merely followed out a system which, the learned Serjeant alleged, was pursued by railway directors gener-

ally — that of dealing in the company's stock in other parties' names. It was contended, in fact, that the transfers were dealings in genuine stock, and that Redpath was sought to be made a scapegoat for the whole of the higher officials; but of course, any such assumption was fabulous. Mr. Justice WILLES, in summing up, clearly analyzed the circumstances, and stated that the question for the jury was, whether the instrument before them was a real or a fictitious transfer, and whether it had been executed by the prisoner for the purpose of fraud. The jury saw this, and after a few minutes' deliberation, without leaving the box, returned, what was naturally expected, a verdict of guilty. . . . His lordship then passed upon the wretched criminal what many persons consider the heaviest sentence which can be pronounced — transportation beyond the seas for the term of natural life.

97. CASE OF B. (ARTHUR MACDONALD. *Man and Abnormal Man*. 1903. p. 516. U. S. Sen. Doc. 187, 58th Cong. 3d Sess.)

Received July 25, 1887; offense, —¹; age, 11; eyes, brown; clothing, fair; resides with parents; never in the almshouse; at police court of — on complaint of —; weight, 34 kilos; height, 1371 mm.; hair, brown; education, second reader; previous arrests, two or three for stealing and staying out; never in orphan asylum, but in reform school; three months ago was in Catholic protectory and assigned to knitting department, first division. Parents: Father, intemperate, dock laborer; he does not know whether any of them were arrested; no stepfather or stepmother; father, Irish Catholic; family consisting of two boys and two girls.

June 20, 1889: Height, 1428 mm.; in chest, 723 mm. April 2,

1890, he was intrusted to the care of his mother.

June 21, 1890, when recommitted by police court for —. Weight, 41 kilos; height, 1485 mm.; clothes, good.

Record of Complaints against him while in Reformatory. — 1888, May 14: Leaving the line while returning from chapel last Sunday morning; not going on the yard. (Pleads guilty, case held open.)

May 21: Running around the yard with two others, shouting and making all the noise they could; would not come when called; refused to go on parade; kept running until I caught and locked them up. (Sunday, pleads guilty.)

May 22, by watchman: Disorderly in the yard, kicking stones

¹[This and the next case are intended as exercises in speculating from the person's character-record what the offense would probably be for which he is now imprisoned. The cases should first be studied with that question in mind. Then in a footnote at the end of No. 98 will be found the answers to Nos. 97 and 98. — Ed.]

up against the shop windows while on parade. (Punished with a strap, 5 blows, 1 week, pleads guilty.)

May 23: In company with other boys entered knitting shop; machines tampered with; a few articles were missing. (Five to ten strokes with a strap, 8 weeks.)

May 31: Throwing his window frame out of the door; spoken to many times about being disorderly. (Five blows with a strap, 1 week, pleads guilty.)

July 15: Loud and disorderly after whistle was blown for parade; crowding where there was no room for him, and when asked to go to another place did not do it until I insisted on it, then he was very insolent; also fought with another boy. (Pleads guilty.)

July 16: Disorderly in wash room and training room almost every day. (Five blows with strap.)

July 21: Leaving dormitory and going to others; also generally disorderly; impossible to keep him in his dormitory. (Pleads guilty.)

August 28: Taking the plate of hash, and refusing the rest of the boys to have any; would not stand up. (One week.)

September 6: Disorderly on parade; scuffling on the bench in the yard.

September 17: Burglarizing with another boy while on parade.

September 18: Kicking another boy. (Excused, with reprimand.)

September 19: Throwing a hat about the sleeping hall, and lying about it. (Reprimanded.) Other complaints on September 21, October 4, October 10, October 15, October 31, November 13, November 22.

November 25: Rank impudence and insubordination; demanded a ticket to hospital in impudent manner; he was told to wait and see Mr. K.; was very impudent. (Punished with strap, 1 week.) Other complaints December 15, December 18, December 20.

December 29: Going to bed with

his clothes and stockings on, which I had forbidden. (Admits it, 1 week.) (In an interview he said he was cold and so kept dressed.)

1889, January 9: Talking on parade in lavatory. (Admits it, 2 weeks.)

January 15: Stealing a pair of second badge pants from boy "S." Other complaints January 16, January 22, January 29, February 1, February 11, February 16, March 30, April 12, April 16, April 22.

April 28-29: Having four keys in his pocket and tobacco; one key fitting drawer in an officer's room, which has been opened several times and articles taken out. (Punished with strap.) Other complaints May 2, May 22.

May 31: Disorderly in ranks when boys were marching to dormitory, getting out of his place, and insolent when spoken to about it. (Held open.) Other complaints June 17, June 25, June 26.

June 27: Going into boys' dormitory for plunder; got under the bed; I told him to come out and he would not do so. (Admits, except plunder, 3 weeks.) Other complaints October 5, October 22, October 24.

1890, January 23: Going into "B's" dormitory. (Admits, held open.)

January 30: Going to bed with his trousers on; I put him on the floor and he was very impudent and abusive and positively refused to do what I told him. (Admits it, under lock and key for one week.) Other complaints February 28, August 29, September 2.

September 26: Refused to go to the superintendent when requested; throwing a chair at the officer and calling him a G—— d—— liar.

September 27: Detected in taking putty off of some freshly glazed windows.

1891, January 12: Impudent to an officer, telling him to shut up and get out.

He escaped by scaling the wall

and was recaptured. He gave his guard the slip at the depot, but was captured again. He was placed in confinement, but succeeded in getting out; search high and low was made for him until he was found by one of the other inmates in the top of a tree late in the evening. After attempting to escape day after day, he was finally transferred to the penitentiary.

Testimony of Officers as to his Conduct.—Yardman: "'B' is a good boy; gets along with me very well. I let him wear a tie of mine one Sunday for being a good boy. I have to trust the boys a great deal; 'B' has not stolen but a few things; he does not feel like taking from me."

Hallman: "He gets into a room and steals without any one seeing him; I seldom see him steal. He is a good boy to work; when bad he wants to go here and there; he won't stay at his work, roves around; he has been under me six or eight months; he disobeyed at first, but afterwards with a little pressure he would mind better; he likes to fight; I never saw him cry; he learns quickly; I saw him stealing beans and caught him."

A teacher: "I had him one or two weeks. He was very lazy; tried to get out of his work the best he could; talked to the boys in school a great deal; did not talk back very much; he got into my desk and took some lead pencils."

Another teacher: "He is a little villain; does not bother me much more than the other boys at table; a vicious kind of a boy; he turned upon me one time; he would not stop his talking; he kept muttering; I took him by the collar, and he kicked me when I took him out; I had hold of him with one hand."

Another officer: "He was under me, but never gave me any trouble; never stole anything from me."

A teacher: "He wrote to another boy about his teacher, and signed a boy's name whom the teacher liked very much. He tries to steal some-

thing almost every day; I always find something in his pockets that he has stolen."

A teacher: "He has tried my patience very much; he is bright and peculiar, very stubborn and self-willed, and inclined to take anything in his reach; he never broke into my desk; he would take things from the boys and lie about it; he is disagreeable; he lies, is sulky, no matter how you treat him; he is a fighter; he is perfectly lawless, one of the worst boys I had; he never struck any boy; he is quiet at times; never saw him cry; I have seen him very angry; his face becomes red; he is a good scholar. Since his return his conduct is better the three days he has been under me; he has been absent three or four weeks; he won't talk much; he is a bright appearing boy, but he is stubborn and is a daring fellow." . . .

Teacher in painting and graining: "I never saw him take anything. He has admitted everything I accused him of. At first he would say nothing; afterwards he would admit it. His actions were off-handed. He did not want to say anything then. Everything that had been taken was attributed to him. He hates to have any one question him. When I talked to him he cried, probably because he did not want to leave the shop. He has been under me about eight months. He will make a good workman. Is very accurate in mixing colors; has good taste. Decided in his answers after he knows a thing. He doesn't talk much. He thinks he knows all about badness and malignity. He has improved in his work. If he is going to deny a thing, he would do it at once. He never stole a thing from me, although it was easy for him. He never tried to escape."

Military instructor: "'B' is a good soldier by nature, and a bad soldier, because indifferent. He has no enthusiasm for anything. I have punished him two or three

times. He has more nerve and pluck than any other boy I ever saw. Thought of punishment has no effect on him; he takes it indifferently; but the last time I gave him seven blows, and he said, 'Oh, Mr. —, let me go, and I won't do it again.' He denied it up and down the first and second stroke; the fifth or sixth time he admitted his guilt. After this I made him promise me not to steal for a straight month, and he accomplished it, and was taken out of

the scrubbing gang. He has an indomitable will and enthusiasm if you can get at him in the right way. I have never had any other particular trouble with him. He has not been impudent to me. I have known him to take a whipping in order to shield another boy. He never tells on other boys. He is a boy who would sacrifice to do you a favor."

[Query: Of what offense was he guilty when sentenced to the Reformatory?]

98. CASE OF H. (ARTHUR MACDONALD. *Man and Abnormal Man*. 1903. p. 537.)

As a study in education and criminology the following case of H is of interest, for he is an educated man, as the world goes, a doctor of medicine, graduate of a university, and a man above the average criminal in culture, appearance, and general intellectuality. The importance of studying such a man is to note the gradual steps that led him to his fate.¹ . . .

Antecedents and Childhood. — One who knew his family well says in a letter: "I was born in P, N. H., in an adjoining town to the birthplace of H, which was G, N. H, and inasmuch as H and his parents were frequently attendants upon my father's preaching, and as he attended the district school taught by my wife's sister, and as his wife, and part of the time himself, were in the employ of an uncle of mine, I have a definite knowledge of his youth. His people were very upright, God-fearing citizens, living in a quiet, secluded section of the country. There is no trace or taint of open immorality or vice in the family history for at least three generations of which I have any knowledge. I am intimately acquainted with several of his cousins, and they are all upright men. As a boy, H was a quiet, studious, faithful lad, with refined tastes, not car-

ing to join to any extent in the rude and rough games of his companions at school, and easily standing as the first scholar in his class. He was a general favorite with the mothers in that community, because he was such a well-behaved lad. In his youth he was predisposed to a religious life; he was a faithful, painstaking student of the Scriptures, and rather excelled in his Sunday school class, and later in his Bible class, and my recollection is that he took an active part in the weekly prayer meetings, and was known as a religious youth."

Letter from his First Wife. — "In regard to his childhood days I cannot say much, as I did not know much of him until he was 17 years old. I always felt that he was pleasant in disposition, tenderhearted, much more so than people in general. He was of a very determined mind, at the same time quite considerate of others' comfort and welfare. In 1881 he was at B, Vt., for the year, and in the spring of 1882 he started for the University, and as far as I knew, was doing very well. I returned to N. H. the spring before he was to graduate, and have known very little of him since, but he has always been called very smart, well educated, and a man of refined ways. Before at-

¹ [See the footnote to No. 97 — Ed.]

tending the medical school he taught school several terms and was very successful — as much so as teachers in general — and when the story came out people who had always known him said: 'We cannot believe this. He would not have the heart or courage to do anything so terrible.' But of course he has worked himself up to it little by little, and I think, having done some little wrong, he had been driven to a greater one for a cover, and each one growing worse, of course it is easy or more easy to go in the wrong after the first few steps."

University Life. — Letters of inquiry were sent to his teachers and classmates, many of whom are now prominent physicians.

One of the professors in the university says: "It is true that while a student here he was for a year or two under my roof, but not in any such intimate relations with me as to justify him as looking upon me as his best friend; if so, his friends must be few. However, I am very sorry for him, even although he himself may be the direct cause of his present miseries and threatening punishments. He told me a few months ago, when I visited him in prison, that he and another classmate had worked up a scheme to defraud an insurance company a few months after they graduated in 1884 from the medical department here, but that the scheme fell through because of his friend's death, which occurred within a year after he graduated. I do not know whether he graduated in pharmacy or not. He certainly did not take that course here, as I find he was never entered as a pharmacy student. He may have taken the degree elsewhere, but if he did, it was after he graduated in medicine, as he made no claim to having had a pharmacy course when he was here. There were several things that occurred while he was here as a student that in the light of subsequent events show him to have been even

at that time well practiced in criminal habits. Although he was married and had his wife here for a time doing work as a dressmaker and assisting in supporting himself and her, yet he got into trouble by showing some attention to a grass widow, who was engaged in the business of hairdressing. This woman made some complaints to the faculty during the latter part of his senior year, and the stories that she told, had they been confirmed, would have prevented him from graduating. But I had no reason to doubt his word at that time, and his friends lied for him so vigorously that I was wholly deceived and defended him before the faculty, and he was permitted to graduate. On the afternoon of commencement day he came to me of his own accord, with his diploma in his hand, and said: 'Doctor, those things are true that that woman said about me.' This was the first positive evidence that I had received up until that time that the fellow was a scoundrel, and I took occasion to tell him so at that time. I subsequently learned, however, that he had made two attempts to enter my house in the character of a burglar, and also that he had, while occupying a room in a portion of my house, attempted to force a drawer in my library in which I had been in the habit of keeping some valuables. Three months after he had graduated in medicine, and knowing full well what opinion I entertained of him, he wrote me asking for a recommendation to assist him in getting an appointment as a missionary to Africa. This, I am satisfied, he did simply from the spirit of devilishness, and not that he had any serious intention of carrying out such a purpose. These, and many little incidents that I might relate to you, some of them personal experiences of my own with him, and others that have been told me by members of my family, serve to further illustrate these

traits in his character, but they are all of the same nature as those that I have mentioned." . . .

Testimony of his Classmates. — (1) "Myself and family lived in the house with H and his family almost one school year. His family consisted of a wife and one child (a boy about 4 years old). His wife was a very pleasant woman and willing to make any sacrifice that she might help him along in his course. She finally went out to work and gave him her earnings. She was subject to convulsions of some kind, and while at work he gave her such quantities of bromide that her face broke out very badly. Every one thought it too bad for her. He must have been in very straitened circumstances, for he managed different ways of getting along. I remember he built a barn for a widow woman who was studying medicine in the homeopathy department at that time. She told me how H beat her on the barn. He was very dishonest and tricky any place you found him. He would borrow everything of the students that he could to save himself buying. I have no picture of H. Would never have recognized him by his picture in the papers. At that time he had a rather slender face, wore chin whiskers, not considered good looking; but I remember he had treacherous-looking eyes. Another piece of his wife's economy was to borrow our sewing machine and completely turn out a coat for him. He was not a graduate in pharmacy to my knowledge."

(2) "It happened that H acted as steward of a boarding house (only table boarding). It was his duty to keep the places at the table filled with students and collect the money weekly. My recollection of him is quite distinct. None of the boys ever knew much of him (further than that he admitted himself to be married), or had much to do with him. His associations with his fellow students amounted to but

little, because of his way of living. He had no money, at least that is what he always said. For his meals he conducted the club, while he slept at Dr. H's house. (Dr. H was then demonstrator of anatomy in the university.) This brought him to the boarding house only at mealtime. The money was collected by H regularly every Saturday evening. He was, as I remember, always punctual in performing his duties, and also regular at his meals. Even now I can see him sitting at the lower, dark end of the long table, saying but little and laughing seldom. He was of a remarkably taciturn disposition apparently very indifferent to his surroundings, coldly methodical, unresponsive to humor, and very brief in his statements. His topics of conversation were mainly concerning Dr. H's operations upon his private patients. H, as I have said, slept at Dr. H's house. He always accompanied Dr. H upon his night trips. We students, remarking the thing, always thought that H's quietness was due to his rest being broken and irregular, having always to hitch up the horse for the doctor's use, perhaps accompany him, and then stable the horse upon the doctor's return. I remember once of asking a medical student how H answered up in his 'quiz.' The answer I got was that he was not very reliable or exact in his knowledge." . . .

(3) A classmate who is an alienist, says: "My recollection of him is that he was a quiet, unpretentious individual, not a brilliant student by any means, but rather plodding and perhaps below mediocre, but attentive to lectures and operations. My connection with this institution has been continuous since the day of my graduation, and in the light of the experience I have had in seeing a large number of insane and defective people, I cannot now recall anything about H that would warrant me in saying

that he was peculiar, degenerate, defective, or insane, or that he lacked the average mental or moral qualities."

(6) "I was quite well acquainted with him. He always stated to me that he was born in England. He seemed always of a sullen disposition, not caring to talk much, a fair student, although not bright, and still he might be stated to be of average intelligence. We attended many lectures together, and occupied seats close to each other. He was not at all popular and seemingly had very few intimate friends, and the talk was that he would not be able to pass his final examinations, as, if I mistake not, he entered on advanced standing. If I mistake not, he stated that he was a married man, and complained frequently of lack of funds to complete his studies." . . .

(8) "I know of nothing in his character during my acquaintance with him which would mark him as exceptional in any way. I remember he was identified with the Young Men's Christian Association of the university, and took sides with that society in a dispute between the society and one of the professors, and he told me at one time that after graduation he intended to go to New Zealand as a medical missionary. On the whole, his conduct was such as to breed sensation of dislike for him among his fellows. He appeared to be a good deal of a sneak, and I know as a matter of fact that he was a liar. He seemed to be fond of the uncanny things of the dissecting room, and told me at the beginning of one spring vacation that he intended to take home the body of an infant for dissection; that Dr. H had given him one for that purpose. He seemed to derive a good deal of pleasure from the fact. Nevertheless, he was not an industrious worker in the dissecting room."

(9) Classmate, president of a State medical society, says: "I

saw him daily. His appearance was very ordinary. He was of a meditative, unassuming disposition, willing to talk if approached, but his manner was retiring. He was apparently most inoffensive; we then thought him stupid. In his difficulty with the dressmaker we, boylike, believed poor H was being sinned against, and selected a law student, now a member of Congress for Idaho, to intercede for him, with the result that the faculty was lenient and H was 'vindicated.' His bearing so little resembled that of one who sought the company of women that we regarded the incident as a great joke. Even at that time he was given to devising schemes for money making; speculating on projects that might be taken up after graduation. We did not regard them as of doubtful integrity, yet none of them were in line with the profession he was about to be graduated into. We looked upon them as visionary. He had no chums or associates, so far as I knew; always alone, of modest demeanor, and never aggressive. It was a serious struggle with him then for bare existence, and we pitied him without thought of his merit, for he was, as we saw him, a negative character."

(10) "He was a fellow to slide along without attracting any attention, and would be soon forgotten. There was an episode in which he acquired some notoriety, and if guilty, showed much foresight and caution on his part. The facts are as follows: A young widow was running a boarding house, he being one of her boarders. She obtained a letter to him from his wife; she brought her case before the faculty, claiming that he had promised to marry her, and in evidence produced some letters signed in his name. He denied the charge, and produced specimens of his handwriting, including notebooks, etc., which were not in the same hand as the letters produced by her. The evidence

was not such that the faculty could convict on, so they let him off. The opinion among the students was that he was the one who wrote the letters." . . .

(13) "He had a noticeable aversion to familiarity. During the time spent with Dr. H. he took active interest in Sunday-school work of the Presbyterian church, of which Dr. H was a prominent and active member. I remember him as an odd character in the class on account of his seemingly friendless fate and the manner in which he worked himself into the good graces of Dr. H. About the last thing he told me was he had decided to go as a medical missionary to some foreign country after graduating, and that Dr. H had acted in his behalf to secure for him all the necessary credentials for the undertaking."

(14) "To me he was especially noticeable for his rather delicate and fair facial complexion and rather blue and open eyes. He had a thin mustache curled up at the ends. His habits were decidedly of a secretive nature, and consequently he was never much discussed."

(15) "I was quite intimately acquainted with him and can honestly say that he was the last man that I would suspect of doing the deeds of which he was convicted."

(16) "He was sickly looking and troubled quite a little with boils. He was peculiar in that he did not seem to care for any one but himself and paid but little attention to any one. I thought he was rather repulsive in looks, but never thought him a criminal." . . .

(21) "I remember having heard him referred to on one or two occasions as a 'smart Alec.' . . . As I remember, he was looked upon as a bigot and a fellow of so little consequence that it was not worth one's while to pay any attention to him so long as he kept to himself."

(22) "I considered him a quiet, bright, unsophisticated sort of a

young man. I saw nothing abnormal or anything to especially attract attention. He seemed rather gloomy at times and not inclined to be intimate with any one." . . .

(24) "I boarded at the same boarding house as he. After a few months the landlady found that he was cheating her by various methods; each boarder that left, he would report to the landlady that the boarder had not paid him for his board for several weeks, and pocket that amount of money. Also in ordering groceries he would 'beat' the lady. The other students thereby found out that he was dishonest. He appeared to be a sneaking, quiet, unpopular man, other students not associating with him to any extent. I never knew of him drinking. He did not seem to be a 'fast' boy, but a mean fellow. As to his scholarship I remember only that Professor V did not pass him on some branch and H was very spiteful against Professor V — wrote him letters calling him vile names and spoke bitterly against him."

(25) "He never entered into sports of any kind, seldom laughed, sometimes smiled in a dry, half-hearted way — he seemed secretive and afraid of suspicion."

(26) "He was looked upon as one who would attempt to attain favor with the faculty by spying among the students."

(27) "I was well acquainted with him. I have read everything about him since he was arrested, and I know he tells the truth in some of his confessions."

Letter from one who lived in H's house in Chicago.—"February 2, 1889, I moved into a room in the Castle and remained there till December 3, 1889. He was always quick and active. If you had seen him in the drug store in Englewood you would have thought him the busiest man you ever saw. Was considered the best druggist and chemist that ever came here, and his store was always filled with

customers. . . . He was one of the biggest swindlers they ever knew, but when he hired a man to do any work he always paid him what he asked without a word, but if he made a bargain with any one that could afford to lose without breaking him up he would 'beat' him almost every time. The iron columns in front of his building are an example. He never paid a cent for them and beat them in three courts. His gas business and using the city water for two years and making them believe it was artesian water were other instances. Bringing the city gas through a tank of water, he put stuff in the water to color the flame until the gas inspectors declared that it was not theirs."

Letter from a prison chum.—"It

is very little information that I can give you regarding H. I met him for the first time in the jail, and was only with him for some three or four weeks while he remained in jail in St. Louis. . . . I know nothing about him, but what he told me of some of his former exploits before I met him. Of course you know that he told me all about the scheme to rob the insurance company, and that it was for introducing him to a lawyer who could be trusted to be allowed to know that the scheme to rob the insurance company was a fraud, etc., that I was to have \$500 to enable me to fight my case or secure my liberty."

[Query: Of what crime was this man found guilty, when his case was studied by Dr. MacDonald?]¹

99. ALFRED SCHWITOFSKY'S CASE. [Printed *post*, as No. 381.]

Topic 2. Emotion (Motive)²

101. JAMES SULLY. *The Human Mind*. (1892. Vol. II, p. 196.) *Desire*. The phenomenon known as desire has, as we have seen, its dim prototype in instinctive impulse. . . . The Analysis of Desire. (1) Since all definite desire is of some object or perceptible result, one obvious element in the physical state is an idea or representation. When a child desires an object, say an orange, or a playmate's society, he is imagining this object as actually present or realized. In this way all desire is related to the intellectual side of mind. Where there is no knowledge there can be no desire. . . . (2) A closer inspection shows us that all representations do not excite desire. Many images, *e.g.* those of familiar objects in our surroundings, other people's doings, and the like, may arise without any appreciable accompaniment of mental craving or desire. This peculiar psychical state is only aroused by the representation of objects so far as they excite our feeling, and more particularly are thought of as fitted to benefit us or bring us pleasure. In desiring a succulent fruit a child represents the delight of eating it: in desiring a good social position or a high reputation a man represents the coveted situation on its pleasurable side. . . . (3) While desire thus stands in relation to each of the two other phases of mind, it is sufficiently marked off as an active phenomenon. It is in virtue of this

¹[Answers to Nos. 97 and 98:

No. 97. Petty larceny.

No. 98. Murder. This was Holmes, one of the most ruthless murderers of his generation; ten or more murders were traced to him, and his "Castle" in Chicago was a veritable charnel-house. He was convicted and executed in Pennsylvania; see Official Report of Commonwealth *v.* Mudgett, alias Holmes. — Ed.]

²[Compare the analysis of Motive and Emotion in No. 29, *ante*. — Ed.]

characteristic that it constitutes the connecting link between knowing and feeling on the one side, and willing on the other. In desiring a thing, say an approaching holiday, we are in a state of active tension, as if striving to aid the realization of that which is only represented at the moment, and recognized as such. This innermost core of desire has been variously described as a movement of the mind (*e.g.*) by Aristotle, and more commonly as a striving towards the fruition or realization of the object.

This element of active prompting in desire appears under each of the two phases which, as we have seen, are always present in our active states, viz. attention, and muscular consciousness. . . . We thus see that there is in the very process of mental concentration, as soon as this becomes consciously directed to the representation of something agreeable and desirable, the germ of a purposive activity, the striving towards an end. . . .

Desire and Aversion. The great contrast in the region of feeling between pleasure and pain has its counterpart in the domain of activity. While the representation of what is pleasurable excites the positive form of desire, that is, longing to realize, the representation of what is painful awakens the negative form of aversion, or the longing to be rid of. We strive towards what gives us pleasure, and away from what gives us pain. . . .

Desire and Motive. Hitherto we have dealt with desire merely as a state of craving without any reference to the nature of the desire as realizable or non-realizable. It is evident that we have many desires which do not go beyond this stage. . . . A desire when thus transformed into a practical incentive, or excitant to action, is what we call a motive.

A motive is thus a desire viewed in its relation to a particular represented action, to the carrying out of which it urges or prompts. . . . As the feelings grow in number and the higher forms of emotion begin to appear, the conative process is prompted by a larger variety of desires. Thus the child begins to act for the sake of earning praise, of giving pleasure to others, or of doing what is right for its own sake. In this way each new advance in emotional development tends to widen the range of desire in a corresponding measure. . . . There now appears as a result of this development of ideation and feeling a new form of conative stimulus, which we can describe as Motive-Idea. . . . The development of reflection and self-consciousness leads to an organization or unification of action into a connected system. Thus, ambition when fixed as a steady incentive means a recurring motive-idea, leading to a succession of progressive actions, the whole constituting the pursuit of a permanent end. . . .

Nature of Permanent Ends: Desiring Means as Ends. The pursuit of these permanent ends illustrates in a specially distinct form a common tendency in all states of desire to the fixing of attention not so much on the end itself as on the conditions of its realization. As was pointed out above, the desire for an object begets a desire for the action which is seen to lead on to the realization of it. In order to carry out any line of action, it seems necessary that we should fix attention on the immediate result of the act, as that which guides and controls the process. Hence the tendency to erect this proximate result into a kind of secondary "end" of the action. Thus if a person feels cold and goes to shut the door, realization of the idea of the closed door becomes the immediate object of his action. That is to say, for the moment he loses sight of the initial stimulus, feeling of

cold and the idea of the desired warmth, and is occupied in shutting the door. If an obstacle occurs, as when the latch does not answer, he becomes wholly absorbed in this secondary end. In the case of pursuing a permanent end, as riches, or health, this preoccupation of the mind with the means of obtaining our object becomes still more marked. . . .

Complex Action. Our action, as we have seen, gains in representativeness as we take remote consequences into account. And this increase of representativeness implies an increase in the complexity of the action. In a special sense we may call an action complex when it is not the result of a single impulse but involves a plurality of impulses, a representation of a number of objects of desire or aversion. . . . This expansion of the representative stage of action assumes one of two contrasting forms. In the first place, the desires or impulses simultaneously called up may be harmonious and coöperative, converging towards one and the same action. In the second place, the desires may be discordant and opposed, or diverging into different lines of action.

(a) *Coöperation of Impulses.* The combination of two or more elements of desire or impulse in one conative impulse is exceedingly common, and may be said, indeed, to be the general rule. Many actions which seem at first sight to have but one impelling motive will be found on closer inspection to have a number. So simple an action as going out for a walk may be motivated by a number of concurrent impulses, as desire for locomotion, fresh air, and a change of scene. . . .

(b) *Opposition of Impulses.* The second variety of complex action, in which two (or more) impulses come into antagonism, is of yet greater importance. . . . *Arrest of Action: Inhibition.* This variety of complex action is characterized by the clearer emergence of an element in the conative process hitherto neglected, viz. the arrest or inhibition of action. . . . It is when we are simultaneously prompted by a plurality of impulses leading in distinct directions, that is, to different external actions, that the process of inhibition becomes manifest. The opposition of motor forces in this case produces an arrest of action which may be temporary only, leading to a delay or postponement of the action, or may end in its complete suppression. . . .

(1) *Action Arrested by Doubt.* The simplest case of arrested or inhibited action is that in which the belief necessary to the carrying out of an impulse is checked. In the early stages of action we are prone to be confident in our powers. We can easily observe in children's first experiments in movement that they are carried out boldly, that is, with a full assurance of success. To these hopeful tyros in the domain of human action failure comes as a shock. The child looks perplexed, confounded, when he first encounters an object too heavy to be removed. These failures suggest uncertainty, and this sense of uncertainty or doubt will serve to arrest or temporarily paralyze the child's action. . . .

(2) *Recoil of Desire: Deterrents from Action.* A second and in general more effective form of arrest occurs when desire prompts to a certain action with which is associated some painful accompaniment or consequent. In this case the impulse to realize a pleasure is opposed by an aversion to what is disagreeable. And so far as this shrinking from a painful experience frustrates the positive impulse, we are said to be deterred from the action.

. . . The deterring force in this case may reside either in the representation of the action itself as disagreeable, or in the anticipation of some disagreeable result. . . . Here, again, the effect of the prevision of evil in repressing impulse will vary according to a number of circumstances, such as the relative strength of the attractive and deterrent forces, and the strength of the general disposition towards activity at the time. Here, too, we may note marked differences of effect according as the temperament is wary or cautious, and highly susceptible to the deterrent effects of anticipated evil; or, on the other hand, heedless of unpleasant consequences and impatient of delay — a contrast well illustrated in the case of Macbeth and his wife when planning their ambitious crime.

(3) *Rivalry of Impulses*. As a third type of arrest, we may take the case where there arises a plurality of positive impulses. When a man is at one and the same moment stimulated to different lines of action by two disconnected desires, conflict arises through the prompting of incompatible impulses. . . . This rivalry of impulses or desires may assume different forms. Thus two actual feelings may prompt in different directions, as when, tired and hot after a walk, we are at once compelled to rest, and to procure a draft of water.

102. G. F. ARNOLD. *Psychology applied to Legal Evidence*. (1906. pp. 38, 87.) . . . We must next explain "Motive" and what it is that determines conduct. By "motive" is usually meant an ulterior end. But what actually moves us is a felt contradiction, and a thought or idea moves us by exciting desire: desire there is the real stimulus. It is the feeling excited by the idea of the end, or, as Wundt describes it, motives are internal causes of volition, and a motive is a particular idea with an affective tone attaching to it, and the combination of idea and feeling in motives only means that an idea becomes a motive as soon as it solicits the will, feeling itself being simply a definite voluntary tendency. It will be well to dwell for a moment on the part played by desire. "Where, however," says Professor Sully, "circumstances allow of a gratification of the desire, this passes into a new form, viz. an impulse to carry out a particular line of action. A desire when thus transformed into an incentive or excitant to action is what we call a motive. A motive is thus a desire viewed in its relation to a particular represented action, to the carrying out which it urges or prompts."

Now desire does not always follow knowledge, but, on the contrary, "instances are by no means wanting of very imperious desires accomplished by the clear knowledge that their gratification will be positively distasteful." . . .

The writers are unanimous to the effect that what determines conduct, voluntary and impulsive alike, is *not intellect or ideation, but feeling*; and that although in will there is an ideational element, it is through feeling that it influences action. Thus Ribot quotes with approval the saying of Spinoza that "appetite is the very essence of man. . . . Desire is appetite with consciousness of self. . . . From this it results, that the foundation of effort, volition, appetite and desire, is not the fact that a person adjudged a thing to be good; but on the contrary, a person deems a thing good because he tends towards it from effort, will, appetite and desire."

Similarly Professor Hoffding: "Everything which is really to have power over us, must manifest itself as emotion or passion. Mere 'reason' has no power in actual mental life; there the struggle is always between feelings. The frequent talk of the conflict of reason with the passions is consequently psychologically incorrect. No such conflict can take place directly. A thought can suppress a feeling only by exciting another feeling which is in a position to set aside the first." . . . That conduct is guided really by emotion and not by knowledge or understanding, and that intellect is not a power but an instrument which is moved and worked by forces behind it, viz. the passions, is insisted on by Herbert Spencer, who concludes that it is only by awakening appropriate emotions that character can be changed. . . .

Motives, however, are *not mere feelings*: they are combinations of ideas and feelings. "Every motive may be divided into an ideational and an affective component. The first we may call the moving reason, the second the impelling feeling of action. . . . The reason for a criminal murder may be theft, removal of an enemy or some such idea, the impelling feeling, the feeling of want, hate, revenge or envy. When the emotions are of a composite character, the reasons and impelling feelings are mixed, often to so great an extent that it would be difficult for the author of the act himself to decide which was the leading motive. . . . In the combinations of ideas and feelings which we call motives, the final weight of importance in preparing for the act of will belongs to the feelings, that is, to the impelling feelings rather than to the ideas. This follows from the very fact that feelings are integral components of the volitional process itself, while the ideas are of influence only indirectly, through their connections with the feelings." ¹

Of course if you choose to confuse the various meanings of "cause," . . . "motives" among other things may be termed causes, but no good in our opinion comes of confusing the Final with the Efficient Cause. . . . Motive in the sense of that which moves the mind is the idea of physical force contained in Efficient Cause, but "inducing" cause and "influencing" is the idea of purpose contained in Final Cause; and while it is true that no action can be done without an agent to produce it, it is not equally true, if indeed it is true at all, that every act must have a purpose, nor yet does every purpose produce an action. "Between Cause and Motive," says Wundt, "there is a very great difference. A cause necessarily produces its effect: not so a motive. A cause may, it is true, be rendered ineffective, or its effect be changed by the presence of a second and contrary cause, but even then the result shows the traces of it, and that in measurable form. But a motive may either determine volition or may not determine it; and if the latter is the case, then exerts no demonstrable effect." ² The fact is that, though motives are of the nature of causes, they are a class of causes that will not admit of the mathematical or mechanical treatment which is applicable to the scientific and popular conceptions of the term. It is the principle of sufficient reason rather than of causation which explains the relation between motive and conduct.

On the whole, we should say that the comparison of motives and acts

¹ W. Wundt, *Outlines of Psychology*, 2d ed., p. 204.

² Wundt, *Human and Animal Psychology*, pp. 432-433.

with cause and effect above quoted contains more falsehood than truth. It is true that every effect must have a cause, but it is most certainly untrue that overt act must have a conscious motive, which is the sense in which "motive" is there used. Apart from the fact that mere reflex actions have clearly no motives there are many acts which once had a motive but have now become mechanical in the course of evolution, *e.g.* twitching the ears, etc. Again, "in every asylum," writes Professor James, "we find examples of absolutely unmotivated fear, anger, melancholy or conceit; and others of an equally unmotivated apathy which persists in spite of the best of outward reasons why it should give way."¹ Nor does it assist to say that "there must exist a motive for every *voluntary* act," for if any real meaning is to be given to "voluntary," such acts must be distinguished from impulsive ones: as Professor Stout says, "voluntary action is to be sharply distinguished from impulsive action and deliberation from conflict of impulsive tendencies," and a very large part of our actions are impulsive. While if "voluntary" is understood to imply an idea of the end in which the self is realized, then it is little better than tautology to say that every voluntary act implies a motive, for motive is simply such an idea of an end exciting our feeling. It is really the thinking of the end that makes it a motive, and, when this is realized, all analogy at all events to Efficient cause is gone, and with it the necessary connection between antecedent and consequent on which the argument relies.

103. JOHN H. WIGMORE. *Principles of Judicial Proof*.² (1913.) It has been noted (*ante*, No. 29) that the term "motive," as commonly used, does not serve to discriminate the two different processes to which it may be applied. (1) It may be attempted, first, to infer, from the existence in A of a desire or inclination to do act X, that this desire, urging him on, probably resulted in the doing of the act; as when it is argued that, because A desired and wished to get rid of B, he probably did do something towards getting rid of B. (2) Secondly, in proceeding in turn to evidence this desire or other emotion, certain circumstances may be offered as tending to show its existence; as when the argument is to the existence of this desire in A (a) from an injury which B has done to A, or (b) from A's outward conduct expressing such a desire, or (c) from the prior or subsequent existence of such a desire. The former inference involves the evidencing of a Human Act. The latter inference involves the evidencing of a Human Quality or Condition.

Both inferences can best be studied together; but they are affected by different experiences of human nature, and by different opportunities for erroneous inference.

1. *Evidence to prove the Existence of an Emotion.* The modes of inference circumstantially to a human quality or condition, as already pointed out (*ante*, No. 3), may be of three kinds, all of which come into use in the present subject: (a) From circumstances tending to excite, stimulate, or bring into play the emotion in question; (b) From outward conduct expressing and resulting from the emotion in question; (c) From the prior or the subsequent

¹ W. James, *Principles of Psychology*, Vol. II, p. 459.

² Adapted from the same author's *Treatise on Evidence* (1905, Vol. I, §§ 385-395, 118).

existence of the emotion in question, as indicating its existence at the time in issue. The first of these is a Prospectant indication; the second is a Retrospectant indication; the third is of both sorts. Each sort of inference has its own dangers and difficulties.

a. Circumstances tending to excite an Emotion. It must be remembered that this mode of argument is equally available in civil as well as in criminal cases. One is perhaps apt to think of "motive" as a matter involved in criminal cases only. But a recollection of the process involved — that of inferring the existence of some emotion, from which in turn the doing of an act is to be inferred — shows that this process may be equally a feature of proof in civil cases, though not as frequently as in criminal cases.

The general inquiry is, What circumstances tend probably to excite a given emotion? Obviously, the whole range of human affairs is here involved. It would be idle to attempt to catalogue the various facts of human life with reference to their potency in exciting a given emotion. Such an attempt would exhibit two defects. It would be pedantic, because it is impossible to suppose that the operation of human emotions can be reduced to fixed rules, and that a given fact can have an unvarying quantity of emotional potency. It would be useless, because the emotional effect of any fact must depend so often on the surrounding circumstances that no general formula could provide for the infinite combinations of circumstances. Courts have therefore always been agreed that in general no fixed negative rules can be made; that no circumstance can be said beforehand to be without the power of exciting a given emotion; and that, in general, any fact may be conceived as tending with others towards the emotion in question. A few of the commoner illustrations may here be noted.

Motives for Murder. The circumstances which might excite a desire to kill are innumerable. Circumstances involving the sexual passion, in one aspect or another, and usually operating through the emotion of jealousy; the expediency of preventing the discovery of a former crime, or of evading an arrest or a prosecution for it; the conduct of the deceased in opposing or injuring or trying to injure the defendant; the defendant's relations with a third person having a desire to kill the deceased may induce him to co-operate, through the sympathy either of friendship or of domestic ties, or by reason of pecuniary hire or of fraternal pledges; finally, and a most common circumstance, the deceased's possession of money or property as leading to the accused's desire to kill.

Motive for Other Deeds. The circumstances that may serve as motives for other deeds are innumerable. A few will be noted which serve to show the various discriminations that may arise in using the pecuniary circumstances, of one or another person or thing, as tending to excite a motive in some person. (1) (a) The possession of money by A may tend to show that B desired to rob or to kill him. (b) The lack of money by A may tend to show that B would be unwilling to trust his promises, and therefore probably did not trust him; in particular, that B would be unwilling to lend A money, or to sell goods to A, or to sell to him as principal, or to sell to him absolutely or to sell to him in good faith. (2) (a) The lack of money by A might be relevant enough to show the probability of A's desiring to commit a crime in order to obtain money. But the practical result of such a doctrine would be to put a poor person under so much suspicion and at such

a relative disadvantage that for reasons of fairness this argument has seldom been countenanced as evidence of the graver crimes, particularly of violence.

(b) On the other hand, the fact that a person was in possession of money tends to negative a desire to obtain it by crime or by borrowing, and is always admissible, the foregoing objection not being here applicable.

Two inferences, involving other principles, must be here distinguished :

(a) The inference that A probably did not lend money to B because A had no money to lend ; this is inferring that A did not do an act because he had not the Means or Capacity to do it (*ante*, No. 73) ; (b) the inference that A probably took money because after the time alleged he had large sums while before it he had little or none ; this is inferring an act from the Traces of it (*post*, No. 139). (3) The market value of an article bought may be received to show the probable price agreed upon ; because the actual value would move the buyer to wish to obtain it for not more than that amount, and hence a serious difference between the actual value and the price alleged by the vendor would throw discredit on the latter's claim. In the same way, where the price is not in issue, but the specific article is, a serious difference between the value of the article in question and the concededly agreed price tends to support an allegation that the article in question is not the one agreed upon.

b. Conduct Exhibiting an Emotion. Every one of the human qualities or conditions with which the foregoing passages have been concerned may be evidenced by conduct exhibiting it. The interpretation of that conduct proceeds always from experience as to the inferences to be drawn from particular kinds of conduct. But the questions that arise in connection with conduct involve usually the principles of the ensuing inference ; *i.e.* prior or subsequent conduct is offered as showing the emotion at that prior or subsequent time, and the then emotion is thus offered as showing emotion at the time in issue ; the doubt or objection being not as to the first of the two inferences, but as to the second.

c. Prior and Subsequent Emotion. Where an Emotion is offered as evidencing an Act (*ante*, No. 101), it is offered as existing at the time of the act ; but its then existence may be proved by its prior or later existence. The nature of the inference, it will be seen, is distinct from those of the two preceding sorts (*i.e.* from extraneous circumstances tending to the excitement of the emotion, and from conduct exhibiting the inward inspiration for the conduct). Here the argument is from an emotional condition once existing to its subsequent or prior prolongation. The peculiar opportunity for error here is that the prior existing emotion may have been brought to an end before the time in issue, and that the subsequent existing emotion may have been first produced since the time in issue. Practically this inference is of course usually associated with two others in a way which may obscure the real evidential question. For example, to show that A struck his wife, the fact is offered that he beat her five years before ; here three steps of inference are involved : (1) the beating five years before evidences a then violent emotion towards her ; (2) the violent emotion five years ago evidences a continuance of the emotion to the time in issue ; (3) the violent emotion at the time in issue evidences the realization of the emotion in the act of striking as charged.

2. *The Emotion as evidence of the Doing of an Act.* Assuming that an emotion exists, the following aspects of it are important.

a. Kind of Emotion as related to the Act. The probative value of the emotion depends much on how closely that specific emotion is related to the doing of the act in issue. This varies according to general experience of human nature and to the moral and mental constitution of the individual.

b. Explanation. On the principle of Explanation (*ante*, No. 2), numerous hypotheses may serve to destroy the probability of the inference, even when it is certain that an emotion towards doing the specific act did exist. *E.g.* outward events may have physically prevented the action impelled by the motive, or the force of the emotion may have been spent before the time of the act; or a counter emotion may have been stronger.

c. An emotion may impel *against* as well as towards an act. Thus, a defendant's strong feelings of affection for a deceased person would work against the doing of violence upon him, and would thus be relevant to show the not-doing. This is also the significance of evidence that there was "no apparent motive" for a murder; for a state of emotional indifference — *i.e.* the absence of any anger, jealousy, or the like — is almost equally powerful in its operation against a deed of violence. Sometimes, of course, such evidence merely negatives an alleged murderous emotion, or negatives the tacit possibility of it; but there is also this affirmative aspect to the argument, namely, that emotional indifference makes against crimes.

d. It is sometimes popularly supposed that in order to establish a charge of crime, the prosecution *must show a possible motive*. But this notion is without foundation. Assuming for purposes of argument that "every act must have a motive," *i.e.* an impelling emotion (which is not strictly correct), yet it is always possible that this necessary emotion may be undiscoverable, and thus the failure to discover it does not signify its non-existence. The kinds of evidence to prove an act vary in probative strength, and the absence of one kind may be more significant than the absence of another; but the mere absence of any one kind cannot be fatal. There must have been a plan to do the act (we may assume); the accused must have been present (assuming it was done by manual action); but there may be no evidence of preparation; or there may be no evidence of presence; yet the remaining facts may furnish ample proof. The failure to produce evidence of some appropriate motive may be a great weakness in the whole body of proof, but it is not a fatal one, as a matter of law. In other words, there is no more necessity, in the law of evidence, to discover and establish the particular exciting emotion, or some possible one, than to use any other particular kind of evidential fact.

104. ALEXANDER M. BURRILL. *A Treatise on Circumstantial Evidence*. (1868. p. 314.)

Emotion as Evidence of the Doing of an Act. The defense, on behalf of the accused, may be founded on the alleged *non-existence* of any motive to the particular crime charged, or the *insufficiency* of the particular motive assigned, to have led to it.

1. The absence of all evidence of an inducing cause to guilt always affording, in such cases, a strong presumption of innocence. But it will avail nothing for the defense that no motive appears or has been affirmatively shown by the evidence adduced. Admitting, as a general truth, that every act must have its motive, it is an obviously necessary inference (independ-

ently of any conclusions of law), that the act proved in the particular case *did* have its motive. It is enough, therefore, to assume that the apparent act had *a* corresponding motive. To go further, and single out *the* particular motive which was the actual inducing cause, as it would be manifestly impracticable, is never necessary.

2. Supposing, in the next place, that the existence and possible influence of a motive are shown, its intrinsic quality or impulsive power is next assailed, and the argument relied on is, that the supposed or assigned motive could not have been, in point of fact, *adequate* to the inducement of the particular act.

This question of the adequacy or inadequacy of motives to the production of their assumed results, opens an extremely wide field of inquiry.

(1) The first ground of the argument against the adequacy of an assigned *motive* to have induced the commission of a crime charged, is the supposed *disproportion* intrinsically existing between them. So aggravated an offense, it is urged, could not have been committed for so insignificant a gain, or upon so trifling a provocation. But it has already been shown that in order to estimate with any correctness, the inducing power of a motive to crime, or the want of such power, the moral quality of the mind to which it is addressed must always be taken into view. Hence there can be no one rule for all cases, as regards adequacy of motive. It must depend on the moral character of the person accused, in each case. . . . Turning from argument to facts, the evidence recorded in numerous actual trials serves incontestibly to show by how trifling and apparently wholly inadequate motives or causes, men *have been* led to the commission of the most appalling crimes. The mere expectation of obtaining a few pounds for a dead human body, as an anatomical subject, was sufficient to induce Burke and his associates to murder no less than sixteen persons. A few words of reprimand led Courvoisier to cut his master's throat, as he lay asleep in his bed. . . .

(2) Another ground of the argument against the adequacy of assigned motives, in particular cases, consists in what may be called the *antagonism* or conflict of motives, or the assumed existence of *restraining* motives operating in an opposite direction. The principal sources of these are three; — the penalties imposed by the law upon crime; the force of the natural affections; and the influence of the peculiar character and circumstances of individuals. (a) The penalties which the law, for the protection of society, imposes upon crime (and which have been called by Mr. Bentham its “tutelar sanctions”) are intended, by the loss and suffering which they hold out as its consequences, to deter men from its commission. These penalties operate, in the most accurate sense, as *motives to restrain* the mass of mankind, who are inaccessible to higher considerations, from giving the reins to criminal desire. Of this argument, no less than of the preceding, it may be said, that it is encountered by actual facts; with this difference, that such facts are of daily occurrence. Notwithstanding the severity of the penalties provided by law, it is notorious that the commission of crime continues to go on. The restraint contemplated is not effectual to the extent intended and desired. A majority, perhaps, of what may be termed the criminally disposed portion of the community are kept in check by the effect of fear, or the natural desire of avoiding threatened loss or suffering. If these were the only influences regarded, the preponderance probably would

oftener lie on the side of restraint and consequent inaction. But, unfortunately for society, this otherwise probable result is, in fact, constantly weakened and overthrown by the presentation of a third class of motives, — those, namely, which involve the *chances of escape or immunity* from punishment. The overwhelming power of the *vengeful* impulse, where it has obtained full mastery of the mind, has already been adverted to. In these cases, the chances of escape from threatened punishment are rarely so much as transiently regarded, much less, accurately weighed. Even the apparent certainty of encountering the full penalty which the restraining motive, in itself considered, presents, fails often to affect the purpose which has been formed. (b) Another class of restraining motives, for which a controlling influence is often claimed in behalf of parties accused of crime, and particularly of murder, consists of those which arise from the influence of the *natural affections*. But it is nevertheless true, that, in particular cases, too numerous, unhappily, for the credit of humanity, these affections have been found to interpose no sort of bar to the gratification of either the gainful or vengeful impulse to murder; or, to speak with more precision, that the affections presumed from the relations of the parties have not, in fact, existed. Cases of parricide, of fratricide, of the murder of children by their parents, of husbands by their wives, and of wives by their husbands, have continually stained the pages of criminal records down to the present day.

105. H. L. ADAM. *The Story of Crime*. (19—. p. 279.) . . . For lesser crimes there may be ample motive, which is invariably made manifest in the task of proving guilt. There are also crimes committed where the motive seems singularly inadequate in comparison with the risk incurred and the consequences which are inevitable upon discovery; and there are crimes for which it is well-nigh impossible to discover any motive at all. It is mainly about the last-named class we are now concerned. I have from time to time sat in criminal courts and listened to cases which have to me presented insoluble problems. I have watched prisoners who have baffled my most strenuous efforts to fathom them — human enigmas. They seem to glide into the dock in a perfectly vacant manner, sit with the face of a Sphinx all through the hearing, and then glide out again to serve the sentence that has been passed upon them. The whole thing seems most painfully perfunctory. It may be accepted as a universal rule of reasoning that for every average human action, however small, there is a motive of some kind, whether it be adequate or not. Even lunatics are said sometimes to have method in their madness. Whenever a man commits a crime, of whatever degree of gravity, for which no motive whatever can be found, it argues the existence of some mysterious mental disorder. It is certainly not the mental disorder which is generally regarded as insanity, for such prisoners as I have referred to above have been closely watched and examined by experts, who have failed to discover any of the symptoms which indicate the presence of ordinary insanity. . . . Their disaffection is one far subtler, more sinister, than ordinary insanity. . . . It is a sudden calamitous visitation, during which the victim commits purposeless deeds; it is a wave of all-powerful emotion which holds captive the mind and impels the victim to extravagant, illogical, and baleful acts. It is intermittent, transitory, and during its prevalence it obliterates all reasoning power, leaving in its

train an aftermath of bewilderment and moral unconsciousness. I have seen prisoners in the dock bereft of all conception of their position, and when they have been called upon to explain or comment on their delinquency they have presented a front of perfect helplessness, as unable to account for their behavior as anybody present in court. . . . This strange malady affects both sexes at all times of their lives, from the period of puberty onward. It is accountable for most if not all of the motiveless crimes committed, and in the case of women it usually culminates in the police court and a charge of "drunk and disorderly." . . . One of the most peculiar prisoners who ever sat in the dock of the Old Bailey was Mrs. Pearcey, who, it will be remembered, was convicted of and executed for the murder of a woman named Hogg. Here again we have the curious neurotic creature, the frenzied and unreasoning slaying. There was no reason that she should have killed the woman with whose husband she was intriguing — she could have gained nothing by it. She had free access to the man, who was a willing party to the guilty connection. It was not for plunder, for the poor woman had nothing with which to tempt the cupidity of anybody. These cases fill one with a vague misgiving. All through the case this woman's behavior was most mysterious. While the police officers were searching her house, in the kitchen of which was the damning evidence of bloodstains, she was playing on the piano in the front room. It seemed incredible that that spare, fragile-looking woman should have been able unaided to have dealt as she did with one so much bigger and heavier than herself, and then afterwards to have wheeled the body in a perambulator for two miles! Such a proceeding betrayed the presence of the supernatural strength which is known to be possessed by the insane. She was defended by Mr. Arthur Hutton, and that gentleman assured me that she was the most mysterious prisoner he ever had to deal with, and that he has always entertained some vague doubt concerning her. He wanted to try and get the charge reduced to the minor one of manslaughter, to work up a theory of some altercation between the two women on the fatal night, — it will be remembered that the deceased woman had gone to the house of the prisoner, at the invitation of the latter, to take tea, — that from words they got to blows, and so the tragedy happened (which, after all, might very well have been), but the prisoner would not consent to this, steadfastly refusing all aid of this kind. She was an exemplary prisoner, going doggedly and resignedly to her doom. . . . But as usual in these cases she was quite unable to give any reason for having committed the deed.

106. ARTHUR C. TRAIN. *Why do Men Kill?* (Collier's Weekly, Jan. 27, 1912.)¹ All crimes naturally tend to divide themselves into two classes — crimes against property and crimes against the person, each class having an entirely different assortment of reasons for their commission. There can be practically but one motive for theft, burglary, or robbery. It is, of course, conceivable that such crimes might be perpetrated for revenge — to deprive the victim of some highly prized possession. But in the main there is only one object — unlawful gain. So, too, blackmail, extortion, and kidnapping are all the products of the desire for "easy money." *But, unquestionably, this is the reason for murder in comparatively few cases.*

¹ Later reprinted in his *Courts, Criminals, and the Camorra*, 1912.

Mr. Charles C. Nott, Jr., Assistant District Attorney of New York, has been trying murder cases for nearly ten years. He has kept a complete record of all of them, and this he courteously placed at my disposal. The list contains 62 cases, and the defendants were of divers races. These homicides included 15 committed in cold blood (nearly 25 per cent, an extraordinary percentage) from varying motives, as follows: One defendant (white) murdered his colored mistress simply to get rid of her; another killed out of revenge because the deceased had "licked" him several times before; another, having quarreled with his friend over a glass of soda water, later on returned and precipitated a quarrel by striking him, in the course of which he killed him; another because the deceased had induced his wife to desert him; another lay in wait for his victim and killed him without the motive ever being ascertained; one man killed his brother to get a sum of money, and another because his brother would not give him money; another because he believed the deceased had betrayed the Armenian cause to the Turks; another because he wished to get the deceased out of the way in order to marry his wife; and another because deceased had knocked him down the day before. One man had killed a girl who had ridiculed him; and one a girl who had refused to marry him; another had killed his daughter because she could no longer live in the house with him; one, an informer, had been the victim of a Black Hand vendetta; and the last had poisoned his wife for the insurance money in order to go off with another woman. There were two cases of infanticide, in one of which a woman threw her baby into the lake in Central Park and in the other gave it poison. Besides these murders, five homicides had been committed in the course of perpetrating other crimes, including burglary and robbery. Passing over three cases of culpable negligence resulting in death, we come to thirty-seven homicides during quarrels, some of which might have been technically classified as murders, but which, being committed "in the heat of passion," in practically every instance resulted in a verdict of manslaughter. The quarrels often arose over the most trifling matters. One was a dispute over a broom, another over a horse blanket, another over food, another over a 25-cent bet in a pool game, another over a loan of 50 cents, another over 10 cents in a crap game, and still another over \$1.30 in a crap game. Five men were killed in drunken rows which had no immediate cause except the desire to "start something." One man killed another because he had not prevented the theft of some lumber, one (a policeman) because the deceased would not "move on" when ordered, one because a bartender refused to serve him with any more drinks, and one (a bartender) because the deceased insisted that he *should* serve more drinks. One man was killed in a quarrel over politics, one in a fuss over some beer, one in a card game, one trying to rob a fruit stand, one in a dispute with a ship's officer, one in a dance-hall row. One man killed another whom he found with his wife, and one wife killed her husband for a similar cause; another wife killed her husband simply because she "could not stand him," and one because he was fighting with their son. One man was killed by another who was trying to collect from him a debt of \$600. One quarrel resulting in homicide arose because the defendant had pointed out deceased to the police, another because the participants got calling each other names, and another arose out of an alleged seduction. Three homicides grew out of street rows originating in various

ways. One man killed another who was fighting with a friend of the first, a janitor was killed in a "continuous row" which had been going on for a long time, and one homicide was committed for "nothing in particular."

This astonishing olla-podrida of reasons for depriving men of their lives leaves one stunned and confused. Is it possible to deduce any order out of such homicidal chaos? Still, an attempt to classify such diverse causes enables one to reach certain general conclusions. . . .

The significant features of this analysis are that about 75 per cent of the killings were due to quarrels over small sums or other matters, drink and women; over 50 per cent to drink and petty quarrels, and about 30 per cent to quarrels simply. The trifling character of the causes of the quarrels themselves is shown by the fact that in three of these particular cases, tried in a single week, the total amount involved in the disputes was only 85 cents. That is about 28½ cents a life. Many a murder in a barroom grows out of an argument over whether a glass of beer has, or has not, been paid for, or whose turn it is to treat; and more than one man has been killed in New York City because he was too clumsy to avoid stepping on somebody's feet or bumping into another man on the sidewalk.

With a view to ascertaining conditions in general throughout the United States, I asked a clipping agency to send me the first one hundred notices of actual homicides which should come under its scissors. This brought in due course 107 clippings, which yielded up the following reasons why men killed: There were 4 suicides, 3 lynchings, 1 infanticide, 3 murders while resisting arrest, 3 criminals killed while resisting arrest, 2 men killed in riots, 8 murders in the course of committing burglaries and robberies, 7 persons killed in vendettas, 3 race murders, and 24 killed in quarrels over petty causes; there were 12 murders from jealousy, followed in four instances by suicide on the part of the murderer; 6 killings justifiable on the "higher law" theory only, but involving great provocation, and 30 deliberate slaughters. . . . The reasons for these homicides were of every sort: police officers and citizens were shot and killed by criminals trying to make "get-aways," and by negroes and others "running amuck"; despondent young men shot their unresponsive sweethearts and then either blew out their own brains or pretended to try to do so; two stablemen had a duel with revolvers, *and each killed the other*; several men were shot for being too attentive to young women residing in the same hotels; an Italian, whose wife had left him and gone to her mother, went to the house and killed her, her sister, her sister's husband, his mother-in-law, two children, and finally himself; the "Gopher Gang" started a riot at a "benefit" dance given to a widow and killed a man, after which they fled to the woods and fired from cover upon the police until eighteen were overpowered and arrested; a young girl and her fiancé, sitting in the parlor, planning their honey-moon, were unexpectedly interrupted by a rejected suitor of the girl's, who shot and killed both of them; . . . a girl of eleven shot her girl friend of about the same age and killed her; several persons were found stabbed to death; a plumber killed his brother (also a plumber) for saying that he stole two dollars; a murderer was shot by a posse of militia in a cornfield; a card game at Bayonne, New Jersey, resulted in a revolver fight on the street in which one of the players was killed; bank robbers killed a cashier at twelve o'clock noon; a jealous lover in Butte, Montana, shot and killed

his sweetheart, her father, and mother; a deputy sheriff was murdered; burglars killed several persons in the course of their business; Kokoloski, a Pole, kicked his child to death; and a couple of dozen people were incidentally shot, stabbed, or otherwise disposed of in the course of quarrels over the most trivial matters. In almost no case was there what an intelligent, civilized man would regard as an adequate *reason* for the homicide. They killed *because they felt like killing*, and yielded to the impulse, whatever its immediate origin.

This conclusion is abundantly supported by the figures of the *Chicago Tribune* for the seven years ending in 1900, when carefully analyzed. During this period 62,812 homicides were recorded. Of these there were 17,120 of which the causes were unknown and 3204 committed while making a justifiable arrest, in self-defense, or by the insane, so that there were, in fact, only 42,488 felonious homicides the causes of which can be definitely alleged. The ratio of the quarrels to this net total is about 75 per cent. There were, in addition, 2848 homicides due to liquor — that is, *without cause*. Thus 80 per cent of all the murders and manslaughters in the United States for a period of seven years were for no reason at all or from mere anger or habit arising out of causes often of the most trifling character. . . .

Now it would be stupid to allege that the *reason* men killed was *because* they had been stepped on or had been deprived of a glass of beer. The *cause* lies deeper than that. It rests in the willingness or desire of the murderer to kill at all. Among barbaric or savage peoples this is natural; but among civilized nations it is hardly to be anticipated. If the negro who shoots his fellow because he believes himself to have been cheated out of ten cents were really civilized, he would either not have the impulse to kill or, having the impulse to kill, would have sufficient power of self-control to refrain from doing so. This power of self-control may be natural or acquired, and it may or may not be possessed by the man who feels a desire to commit a homicide. The fact to be observed — the interesting and, broadly speaking, the astonishing fact — is that among a people like ourselves anybody should have a desire to kill. It is even more astonishing than that the impulse should be yielded to so often if it comes.

This, then, is the real reason why men kill — because it is inherent in their state of mind, it is part of their mental and physical make-up. They are ready to kill, they want to kill, they are the kind of men who do kill. This is the result of their heredity, environment, educational and religious training, or the absence of it. How many readers of this paper have ever experienced an actual desire to kill another human being? Probably not one hundredth of one per cent. They belong to the class of people who either never have such an impulse, or at any rate have been taught to keep such impulses under control. Hence it is futile to try to explain that some men kill for a trifling sum of money, some because they felt insulted, others because of political or labor disputes, or because they do not like their food. Any one of these may be the match that sets off the gunpowder, but the real cause of the killing is the fact that the gunpowder is there, lying around loose, and ready to be touched off. What engenders this gunpowder state of mind would make a valuable sociological study.

107. **GEORGE WACHS' CASE.** (ANSELM VON FEUERBACH. *Remarkable German Criminal Trials.* 1846. transl. Gordon. p. 256.)

[Near Vilsbiburg, in Bavaria, on Thursday evening, April 8, 1819, the family of James Huber, a shoemaker, was found brutally killed, in his little cottage. Father, wife, and two children, had all been murdered with a hammer. Wachs, who had been in the cottage that afternoon and had afterwards left, was arrested, and confessed.] George Wachs, born of Catholic parents, at Solling, in the circuit of Moosburg, on the 17th of April, 1800, and, accordingly, only nineteen years of age when he committed this crime, was the son of a small farmer, who also worked as a day laborer. . . . This young man's immoderate taste for women fully accounts for the suddenness of the change in his moral nature. Wantonness made him riotous, disorderly, and lazy; love of women made him vain and fond of dress, and vanity made him rapacious, until he became first a thief, and then a murderer. . . . Wachs left home at eight o'clock in the morning of Maundy Thursday, the 8th of April, with the intention of making his Easter confession at Vilsbiburg. On his way he met Matthias Hingerl, a peasant's son. . . . Hingerl showed him his watch, which he had fetched from the watchmaker. . . . The sight of this enviable possession painfully recalled to his recollection that, although he certainly had good clothes for the next Easter Sunday, he was still without a watch. At about noon they both went merrily towards home, but stopped by the way at a village. . . . Wachs told him that he had cut his foot with a hatchet, and must have his boot mended before Easter Sunday. With this object only, so at least the accused declared on every examination, he turned back and went to the shoemaker's house. . . . After his boot had been mended, and he had stayed some time with

the shoemaker, he wished, according to his own account at least, to go away at about four o'clock, and asked the shoemaker whether his clock was right? whereupon the latter told him that it was too slow by a quarter of an hour, and desired his wife to fetch him his silver watch from upstairs that he might wind it up. After bringing the watch to her husband, who wound it up, and hung it upon a nail in the wall beside him, she left the house and went to Solling to buy fish for the next day. . . .

"When the woman was gone" — these are the criminal's own words — "we talked over a variety of indifferent matters, and for a long time no evil thought crossed my mind, although the watch was hanging before my eyes the whole time. All at once it struck me how beautiful the watch was. I took it from the wall, examined it closely, opened it, and asked the shoemaker how much it had cost. He told me that with a silver chain and seal, the watch had cost fourteen florins, but that the chain was upstairs in the cupboard, as he only wore it on holidays, when I should be able to see it. I remarked that I had a mind to buy them, if I could ever get together enough money, and he appeared quite willing to sell them. I could not get the watch out of my head: I walked up and down the room with my eyes fixed upon it, and the thought struck me that I would run off with it as soon as the shoemaker left the room. But he never stirred from his seat, and continued hard at work upon the upper leathers of a pair of shoes. The desire for the watch grew upon me every moment, and as I walked up and down the room, I turned over in my own mind how I could get possession of it; and as the shoemaker still sat at his work, it suddenly came across me — suppose I

were to kill him? There lay the hammer: I took it up before the shoemaker's face and pretended to play with it; but I did not hit him directly, because I kept thinking to myself that I ought not to kill him. I walked up and down behind his back for some minutes with the hammer in my hand, but still in doubt. Then my longing after the watch gained the upper hand, and I said to myself, 'Now is the time, otherwise the wife will be here too!' And just as the shoemaker was most busily at work, I raised the hammer and struck him with it as hard as I could on the left temple: he fell from his seat covered with blood, and never moved or uttered a sound. I felt sure that I could kill him with one blow. I should think that a quarter of an hour must have elapsed while I went up and down the room thinking how I could get the watch: at length I struck the blow, and this was my last and worst thought. It must have been in an unlucky hour that desire for the watch took so strong a hold of me. I had never thought about it before; nor should I have entered the shoemaker's house, but for my torn boot.

"As soon as the shoemaker was down I put the watch into my pocket and went upstairs to look for the chain. . . . I turned everything over, but did not find the chain; however I did find six florins in half-florin pieces, thirty kreutzers, and a silver hat buckle. . . . My chief object still was to find the silver chain, and it was only during my search for it that the other things fell in my way, and that I took them. When I had got all these things, I returned to the workshop to take a piece of leather, and perceived that the shoemaker still breathed; I therefore gave him a few more blows on the temple with the hammer, and then I thought that I had better remove him into the big chamber, so that his wife might not see him immediately upon entering the house. I accordingly

dragged him out of the shop into the chamber near the bed." . . . George Wachs was on the point of leaving the house when the two children met him at the door on their return from play. These children had seen him during nearly half the day, and knew him; if they remained alive, he was betrayed. . . . He seized the little boy, and dashed him upon the ground at the foot of the stairs with such violence, that the death rattle was in his throat in a moment. He then flung Catherine with equal violence under the stairs among a mass of wood and iron. . . . At last he thought he might escape in safety, but on putting his head out at the door to see if any one was near, he beheld the shoemaker's wife returning from Solling. . . . "When I saw the woman coming, I said to myself, 'Now I cannot escape; I am lost, and must kill her too.' . . . I stood behind her, nearest the door, and before she was aware of it I struck her such a heavy blow with the hammer on the left temple, that she instantly fell close to the chest, and only cried in a low voice, Jesus Maria! I saw that she could not recover, and gave her several more blows as she lay on the floor, to put her out of her misery. I then dragged her on one side towards the inner room, so that people should not tread upon her as they entered the house. . . . The whole affair could not have lasted an hour. It was past five when I struck the shoemaker, and by six the wife was killed.

"If it had not been for the watch chain, I should have not got into all this trouble, and nobody would have been killed but the shoemaker. I never once thought of killing the wife and the children." . . . The truth of this assertion that he entered the shoemaker's shop without any criminal intention, and that it was not until the watch was so temptingly exhibited before his eyes that the idea of murder entered his

mind, seems somewhat doubtful. It certainly looks suspicious that the same man should have murdered another for the sake of his watch at five in the afternoon, who on the morning of the same day feasted his eyes on a watch in his comrade's possession. . . . These conjectures, however, lose all their weight on closer examination. From first to last the criminal never seems to have acted upon any predetermined plan, but merely to have obeyed the inspiration of the moment, and to have yielded to the temptation of an opportunity created by the coincidence of several accidental circumstances. . . . The events of the forenoon had already filled his imagination with the idea of a watch. . . . In order to make his companion share his pleasure, Hingerl took the watch out of his pocket and allowed him to examine it, boasting of its excellence all the while. George Wachs said nothing, but it was impossible that so vain a young man should not envy his more fortunate companion, and long

for the possession of a similar treasure. Thus, without any guilty thoughts or criminal intentions, George Wachs was prepared, by what he had seen, heard, and felt that morning, for the temptation which afterwards met him in the shoemaker's house. An unhappy chance placed before the eyes of one whose thoughts and wishes had on that very morning been directed towards a watch, just such another, and the tempter, opportunity, stood by. This second watch was not merely shown to him and then returned to its case, but was hung against the wall, where it continued to excite his desires: he could not avoid seeing it, and the longer he looked, the more inviting did it appear. . . . To be the owner of such a treasure, to appear before the women thus adorned, to outshine all his companions, was indeed a tempting vision for a vain lad of nineteen; and in this vision he indulged until liking became longing, and longing ungovernable passion. . . .

108. **GEORGE MANNERS' CASE.** (S. M. PHILLIPPS. *Famous Cases of Circumstantial Evidence.* No. XLVI.)

A Miss Lascelles, of Middlesex, England, formed a matrimonial engagement with one George Manners. Her elder brother, Edmund Lascelles, who acted towards her as a guardian, their parents being dead, strongly objected to the proposed union, but was either unable or unwilling to give any satisfactory reasons for his objections. His conduct towards his sister was extremely violent and harsh; and finally, to appease him, she consented to postpone for an indefinite period the proposed marriage. All correspondence between Mr. Manners and Miss Lascelles was not, however, stopped, and they only decided to wait for a more auspicious season.

One evening, about six o'clock, Mr. Manners suddenly appeared at the residence of Miss Lascelles and

her brother. Mr. Lascelles was absent at the time. Mr. Manners complained bitterly that their happiness should be sacrificed to the passionate freak of the brother, and urged Miss Lascelles to leave the house, go to the residence of a relation, and there be married. The plan she willingly agreed to; but as a condition, made Mr. Manners promise to wait and make one last effort with her brother. Mr. Lascelles returned about nine o'clock, and immediately assailed his sister with insults and reproaches. At the request of Mr. Manners, she left the room, and the two men had a stormy interview, lasting about twenty minutes. Then the door opened, and Mr. Manners was heard to say: "Good night, Mr. Lascelles, I trust our next meeting may be a

different one": and immediately afterward, Mr. Lascelles appearing to have refused to shake hands on parting, in a half-laughing way—"Next time, Lascelles, I shall not ask for your hand—I shall take it."

About an hour later, Mr. Lascelles also went out, and about eleven o'clock the house was aroused by two men carrying his dead body into the kitchen, followed by George Manners with his hands and clothes dabbled with blood. Death appeared to have been caused by two instruments, a bludgeon and a knife; and what appeared most singular, the *right hand, on which was a sapphire ring, was gone*. As Mr. Manners had been heard to speak the words, "he would not ask Lascelles' hand, but take it," suspicion at once pointed to him, and he was accordingly arrested, and committed for examination.

On the inquest, the following testimony was given by James Crosby, a farm laborer: "I had been sent into the village for some medicine for a sick beast, and was returning to the farm by the park, a little before eleven, when near the low gate I saw a man standing with his back to me. The moon was shining, and I recognized him at once for Mr. George Manners of Beckfield. When Mr. Manners saw me, he seemed much excited, and called out, 'Quick! help! Mr. Lascelles has been murdered.' I said, 'Good God! who did it?' He said, 'I don't know; I found him in the ditch; help me to carry him in.' By this time I had come up and saw Mr. Lascelles on the ground, lying on his side. I said, 'How do you know he's dead?' He said, 'I fear there's very little hope; he has bled so profusely. I am covered with blood.' I was examining the body, and as I turned it over I found that the right hand was gone. It had been cut off at the wrist. I said, 'Look here! Did you know this?' He spoke very low, and only said, 'How hor-

rible!' I said, 'Let us look for the hand; it may be in the ditch.' He said, 'No, no! we are wasting time. Bring him in, and let us send for the doctor.' I ran to the ditch, however, but could see nothing but a pool of blood. Coming back, I found on the ground a thick hedge-stake covered with blood. The grass by the ditch was very much stamped and trodden. I said, 'There has been a desperate struggle.' He said, 'Mr. Lascelles was a very strong man.' I said, 'Yes; as strong as you, Mr. Manners.' He said, 'Not quite; very nearly, though.' He said nothing more till we got to the hall; then he said, 'Who can break it to his sister?' I said, 'They will have to know. It's them that killed him has brought this misery upon them.' The low gate is a quarter of a mile, or more, from the hall." Miss Lascelles was also forced to testify to the interview before mentioned, and also to the parting words between the two men.

George Manners was fully committed to stand his trial at the ensuing assizes. Upon the trial the same evidence was produced, and the jury found the accused guilty.

A few days before the time set for his execution some circumstances directed the search for the missing hand—which was still being prosecuted by the friends of Mr. Manners—to the cellar of a barn belonging to one Parker, a small farmer in the neighborhood; and as a reward of their diligence, the missing hand was there found, together with a rusty knife. Parker was at once arrested, and confessed his guilt. The wretched man said, that being out on the fatal night about some sick cattle, he had met Mr. Lascelles by the gate; that Lascelles had begun, as usual, to taunt him; that the opportunity of revenge was too strong, and he had murdered him. His first idea had been flight; and being unable to drag the ring from the hand which was swollen,

he had cut it off, and thrown the body into the ditch. On hearing of the finding of the body, and of George Manners' position, he deter-

mined to brave it out, with what almost fatal success we have seen. He dared not sell the ring, and so buried it in his barn.

109. THOMAS PATTESON'S CASE. (CAMDEN PELHAM. *The Chronicles of Crime.* ed. 1891. Vol. II, p. 599.)

The trial of this person took place at Aylesbury, on Tuesday, March 10th, 1840, before Mr. Baron PARKE, when the indictment charged that the prisoner had been guilty of the manslaughter of John Charles, on the 21st of October previous, at Buckland, in Buckinghamshire. The case excited a great deal of interest in the county, from the condition in life of the deceased and the prisoner, who were both respectable farmers, and from the close intimacy which had long existed between them, as well as from the mysterious manner of the death of the former. Though the coroner's jury returned a verdict of manslaughter only, the prosecutors sent up a bill of indictment for murder to the grand jury, which they ignored.

The main circumstances of the case were, that on the 20th of October, 1839, the deceased John Charles went, about ten o'clock in the forenoon, to the "Boot," on Buckland Common, where he had some beer; and while there, the prisoner came in to take lunch, about twelve o'clock. They remained talking and drinking together until about five o'clock in the evening, when the landlord, John Edwards, came in, with whom they had some more drink. About half past ten o'clock at night they rose to go away, their road being the same to pretty near their respective homes. Before they went, however, Charles said, "I think I am the best man now, let us walk the chalk;" meaning that he was the less intoxicated of the two. "Walking the chalk" is, in this part of the country, the test of drunkenness, and the experiment is performed by the attempt to walk straight upon a

chalked line drawn across the floor, or by walking along the straight line between two layers of bricks where the floor is of that material. The experiment was tried in this case, and the result proved that Charles, the deceased, was the less affected by drink of the two; and he therefore undertook, as is usual between two companions on such occasions, to see the other safe home. Neither of them ever reached his home, for the deceased perished on the way, and the prisoner having been taken into custody the same night, remained in Aylesbury jail up to the day of the trial.

The first person who made known the dreadful catastrophe was the prisoner himself, who, about half-past twelve o'clock on the same night, in a very wild and still intoxicated state, went to Johnson, the policeman, in the town of Tring, about two miles from the place where the death took place, and told him "he had killed a man." At first the policeman did not believe him, thinking it the mere folly of drink; but he persisted, and said he would take him to the place where the body lay. The policeman then went with him, and in a lane leading to the homes of both parties, the body of the deceased was found lying on its back on the grass, in a place not exactly on the road, but where a gap in the field, which was the termination of a footpath running parallel with the lane inside of the hedge, led into the road. That path was one which had been made by people going through the adjoining land to avoid a bad part of the road; and having passed that portion of the road, they came into the road again. The prisoner, before the body was

found, had told the policeman that he was sure the person he had killed was "Joe Kibble, the sweep of Tring, who had been sent by Humphrey Bull to kill him." Humphrey Bull was the relieving officer of the union, of which both the prisoner and the deceased were guardians, and was of different politics from the prisoner, the latter being a liberal, and Bull a conservative; but they were on good terms; and nothing could show more strongly the strange state of delusion which the effects of intemperate drinking had wrought upon the prisoner's mind on that fatal night, than that he should give as a reason for killing one of his friends, that he believed him to be an assassin sent by another friend for the purpose of murdering him! On examining the body of the deceased, it was found to bear marks of dreadful beating on the head and face, which had produced great effusion of blood. The bones of the nose were completely broken, and a surgeon deposed to a concussion of the brain, as one of the effects of the violence which caused death. In the pockets of the deceased were found a ten-pound note, a five-pound note, and some sovereigns. On the notes being taken out of the pocket, the prisoner immediately exclaimed, "These are the two banknotes which Bull gave Joe Kibble to murder me!" At that time nobody present was aware that the body was that of farmer Charles. So far from that, the policeman actually sent a person to the house of Charles, to ask him to come to see the body. The prisoner had previously told the police that he had been going home from the Buckland Inn, with his friend Charles, but the latter parted from him somewhere on the road, he could not tell where.

The probable solution of the mystery is, that the deceased, who was proved to be, when in his cups, of a jocose disposition, and rather addicted to the too-often dangerous practice of practical joking, or what

is vulgarly called "larking," had, in going home that night, resolved to frighten Patteson, who, though a man of prodigious bodily strength, was known to be rather deficient in courage, and had before expressed fears of going home by that lonely road. With this view, it is supposed that Charles, taking advantage of the very drunken state in which Patteson was, slipped away from him among some trees which stood at the entrance of the footpath which we have before described, and which ran parallel with the road along which Patteson had to proceed to his home. A high bank and hedge would screen any person going along this pathway from the view of another on the road. At the place where the pathway led again into the road, at the gap, there was a mound of earth with an open space between that and the hedge, so that a person coming from the gap might, by going partly behind that mound, be concealed until he came suddenly in view, and this is probably what the deceased did in order to frighten his companion; and the position of the body near the gap when found seemed to strengthen that supposition. Whether the deceased laid hold of the prisoner before the latter saw him or not must remain forever involved in obscurity, as the panic-terror into which Patteson was suddenly thrown, operating upon the drunkenness, caused him to destroy the unfortunate man immediately; and it is probable that, from his strength, his first blow knocked him senseless. The prisoner said, that, while he was beating the supposed murderer on the ground, he asked him "who sent him to kill him," and that he pronounced the name of "Bull" three times. This of course was the mere hallucination of the temporary frenzy produced by drunkenness and terror. When the prisoner and deceased left the inn together, the latter had a knobbed walking stick in his hand, the other had none. The stick was

found under the body of the deceased, but not marked with blood, or presenting any appearance that could show that it had been used in inflicting the wounds by the prisoner. Those wounds the surgeon was of opinion were inflicted by the fist only. The prisoner was in an agony of grief as soon as he was made aware that it was his friend and companion Charles that he had so unwittingly slain, and continued in a state of deep affliction, even up to the time of his trial.

On behalf of the accused, evidence was adduced which showed that he was a most amiable and respectable man.

Mr. Baron PARKE, in summing up the evidence, told the jury that if they were of opinion that the delusion which operated on the mind of the prisoner, and led to the perpetration of the fatal act, was caused by such an alarm of personal danger as would not have produced a similar effect upon the reasonable mind of a sober man, they must find him

guilty of manslaughter, otherwise the act would be excusable homicide.

The jury returned a verdict of "Guilty of manslaughter," accompanied by a recommendation to mercy.

Mr. Baron PARKE, in pronouncing judgment, observed, that from the time he had read the depositions he believed the fatal act of the prisoner to have been the result of a delusion produced upon a mind which intoxication had deprived of the control of reason; that the prisoner never had the slightest intention of killing his friend, with whom it was proved he never had any quarrel, was clear beyond all doubt. It was not right that he should, however, go altogether unpunished, but in consideration of his having already suffered five months' imprisonment, he should sentence him to be imprisoned for two months only, hoping that this case would be a warning to all who heard it of the danger of indulging in intemperate habits.

110. **THE GLOUCESTER CHILD-MURDER.** (A. C. PLOWDEN. *Grain or Chaff: The Autobiography of a Police Magistrate.* ... 1903. p. 180.)

... Another murder case comes into my recollection, tried also at Gloucester, before Mr. Justice Lopes. I was asked to defend, and I had the rare satisfaction to my own mind of obtaining what is not often looked for in a trial for murder — a clear acquittal. This case profoundly impressed me by its unutterable pathos; a distracted human soul, torn by conflicting emotions and struggling in vain with destiny — the sort of tale that would have moved the chorus to pity in a Greek tragedy. The accused was a young woman leading an ordinary everyday life, with nothing against her but the one fall of her early womanhood; and yet it was the child of this lawless romance she was accused of having murdered. By her own confession

she had willfully taken its life by pushing it into a deep well close to the cottage where she lived. There was no other evidence against her of any kind. Was it true? and what made her do it? were the questions raised by the case.

Alas! she had herself explained the motive. A lover had found his way to her lonely cottage, a lover who was willing and anxious to marry her but for what he considered the incumbrance of the child. Hence the agony of mind which tore the poor woman in two. Either the child or the lover must go, whatever the love she might feel for either. There was no room in her little world for the double joys of wife and mother, which come to most women almost as their natural right and provide their highest

happiness. One can imagine what the struggle must have been to a simple creature, humbly placed, without much education, and without the aid of those distractions in life which serve to divert the thoughts and still the uneasy prickings of temptation. If in the end the forces against which she had to contend proved too strong for her moral nature, it will be seen that the struggle was fierce and bitter.

Let her speak for herself, almost in her own words. The prisoner was the first to mention the calamity that had befallen her child. Wringing her hands and weeping bitterly, she told a neighbor, who was attracted by her sobs, that her poor child had fallen into the well. Later in the day, when the dead body had been recovered, the wretched woman, after a fresh outburst of grief, confessed to her mother that she herself had done it, and begged her mother to pray for her. She had wanted the child to fall in, and had given it apples to throw in, hoping in this way it might fall in, but to no purpose. The next day, in a calmer frame of mind, she adhered to this confession and told her relatives "she knew she would be hung, but she could bear it no longer. She had done it because she saw no other way of being happy with the man she loved." By this time the matter had become known to the police,

and the prisoner, becoming frightened, made a long explanation, which was taken down, to the effect that the child had fallen by accident. This statement she afterwards declared to be false, and again she repeated the story about the apples, and said she had thrown the child in. "Once before," she added, "I took the child to throw him in. I held him over the well, when my dear boy looked up and said, 'Don't put me in this dark hole, mamma.' I had not the heart to do it, and I took him back." This was the whole story; there was no corroboration from any quarter. Which of the prisoner's statements was the true one? Was it her confession or its retraction? I pressed on the jury as well as I could the danger of a conviction under the circumstances, and reminding them of the old adage that truth lies at the bottom of the well, asked if it did not apply with striking force to the case they had to consider. They took an hour to consult together, and returned into Court with a verdict of "Not Guilty." Nine of the twelve, I afterwards heard, were in favor of a conviction. The verdict was not popular. The excuses which pressed themselves on my mind were overlooked by an angry crowd, and the prisoner, as she left the Court, had to be protected by the police to escape their violence.

111. THE KENT CASE. (J. B. ATLAY. *Famous Trials of the Century*. 1899. p. 113.)

In the little village of Road, some four miles to the northeast of Frome, and on the confines of Somersetshire and Wiltshire, stands Road Hill House, and there in June, 1860, resided Mr. Samuel Savile Kent, deputy inspector of factories. He had been twice married, and was the father of a numerous family; by his first wife he had three daughters and one son living, and his second wife was the mother of three children and was then expecting her

confinement at no distant date. On the night of Friday, the 29th of June, the household consisted of just a dozen inmates, Mr. and Mrs. Kent, the seven children, and three female servants, nurse, cook, and housemaid. Eleven o'clock was the usual hour for retiring, Mr. Kent was in the habit of going over the premises with a lantern to ascertain that all doors and windows were safely fastened, and on this occasion he went his rounds as usual.

The house is a substantial one, a little retired from the road, and inclosed in its own grounds. On entering the front door there is a large central hall, on the left side of which is the library with drawing-room behind it, and on the right the dining room, carried out beyond the general area of the house with a flat roof, over which nothing has been built. At the back of the hall is the front staircase, at the foot of which a door leads to the kitchen and offices. There are two floors above, and on each of them is a landing on to which the bedrooms open. On the first floor above the library were the bedroom and dressing room of Mr. and Mrs. Kent; there were two doors to the dressing room, one leading into the bedroom, the other on to the landing close to the nursery door; this latter, however, was fastened up by a heavy piece of furniture placed against it. Over the hall was the nursery, divided into two compartments, in one of which slept the nurse and two of Mrs. Kent's children, Francis Savile, a boy of nearly four, and a little girl of about twelve months; its single window looked out upon the lawn, and a door gave admission into a smaller room beyond, used as a dressing room, with a window looking out over the flat roof of the dining room. Mrs. Kent's eldest child, a girl of five, slept in a cot in her parents' room. The rest of the floor was taken up by a spare bedroom and two lumber rooms. Overhead, the bedroom above Mrs. Kent was occupied by the two eldest daughters of Mr. Kent; in the one on the opposite side the housemaid and the cook slept together; between them and over Mr. Kent's dressing room was the smaller bedroom of Constance, his third daughter, aged sixteen. The bedroom of her brother William, aged fifteen, and two lumber rooms, completed the floor. The nurse, Elizabeth Gough, was a young woman of three-and-twenty. She bore an ex-

cellent character, and had been with the Kents for about nine months.

This Friday had been a hard day for her; the number of servants kept was hardly adequate to the establishment, and in addition to her own duties she had been up early to assist in a house cleaning. She put the children to bed as usual, and after family prayers Mrs. Kent came into the nursery, as was her wont, and exchanged a few words with the nurse, after which the latter, who was thoroughly tired out, undressed herself and went to bed. About five o'clock she woke up, noticed that the clothes had fallen off the body of the baby, who slept close to her bed; and in raising herself up to readjust them she became aware that Savile's cot, which stood on the farther side of the room away from the bed and opposite the door, was empty. This did not seem to strike her as anything remarkable. Mrs. Kent's room was opposite, she was rather fidgety about her children, the boy had been taking medicine, and his mother might have heard him cry, have stepped across the passage and carried him off; so, being unwilling to disturb the household on a false alarm, she composed herself to sleep again, and did not awake till a quarter past six. This was her usual hour for rising, and the young woman got up, made her toilet, read a chapter in the Bible, and said her prayers with a calmness that did credit to her bringing up, and then walked across to Mrs. Kent's room to inquire for the little boy. She knocked at the door and got no answer, went back, dressed the baby, and again knocked at her mistress's door. This time there was an answer, and Gough asked if Master Savile was there. "With me?" replied Mrs. Kent; "certainly not." "Well, ma'am," said Gough, "he is not in the nursery." This at once brought the mother from her bedroom, Gough ran upstairs to inquire of the two elder Miss Kents

if they had seen the missing child. Their answer was in the negative, and while the nurse was talking to them their sister Constance came to her door to hear what was going on. Meanwhile the whole household was aroused, and Sarah Cox, the housemaid, on entering the drawing-room, which she herself had fastened up overnight, found the door open — though Mr. Kent had locked it — the shutters unclasped, and the window a little way up; no force apparently had been used, nor had the window been broken, and there were no traces of footsteps. Mr. Kent, however, was convinced that the child had been kidnaped from outside. No time was to be lost, his carriage was ordered round, and he drove off to Trowbridge, where was the nearest police station.

The confusion in the house may be imagined; Mrs. Kent, overwhelmed with grief, bitterly upbraided Gough for not alarming her the moment she missed the child, and on the latter excusing herself by saying she thought her mistress had fetched him away, Mrs. Kent burst out, "How dare you say so! you know I could not carry him." Gough made no reply, but afterwards, when doing her mistress's hair, said oracularly, "Oh ma'am, it's revenge." All this while the search was going on out of doors and in. The news had spread, and volunteers from the village lent assistance. Two men, Benger, a small farmer, and Nutt, the village cobbler, made an examination of the grounds. Thirty yards from the house, on the side farthest from the drawing-room, in a shrubbery near the back premises, was a disused closet. This they entered, Benger having a "prediction" that he would find something; a pool of congealed blood was on the floor, and the body of the little boy was discovered in the vault, wrapped in a blanket, and clothed in his night-shirt; his head had been nearly severed from his body by some

sharp instrument, and there was a gaping wound in his chest.

The body was taken to the house, and the mournful news broken to the family. Mr. Kent was still away, but by nine o'clock he had returned from Trowbridge, and learnt from the clergyman, Mr. Peacock, that his son had been murdered. Almost immediately the police appeared upon the scene in charge of Superintendent Foley, the head of the Trowbridge force. Mr. Kent welcomed their arrival, and gave them carte blanche with regard to the household and premises. The wife of one of the police was sent for to examine the female inmates, including the young ladies, but with no result. . . . On the following Monday the inquest was held before Mr. Sylvester, the Coroner, at the Red Lion Inn at Road. In the short interval that had elapsed, popular feeling had become greatly excited, and explain it as we may, there was a strong impression that the crime had been committed not only by some one in the house, but by a member of the family.

After the body had been viewed, the inquest was adjourned to the Temperance Hall as a more convenient place, and the room was crowded to its fullest capacity. The witnesses called were the nurse and housemaid, the men who found the body, Foley, and Mr. Parsons, a surgeon. During the taking of the evidence, which practically told the story given above, jury and bystanders alike showed their excitement, and cries of "Hear, hear," were raised at anything which seemed to confirm their suspicions. The Coroner was of opinion that sufficient evidence had been taken, and declined to examine Mr. Kent, who tendered himself as a witness; but some of the jury expressed a wish that the members of the family should be examined, especially the two children, Constance and William. The Coroner consented, but the feeling of the crowd was so evidently

hostile that he refused to expose these children to insult, and adjourned with the jury to Road Hill House. Constance and William were briefly examined, but nothing was elicited beyond the fact that they had heard nothing on the fatal night. The Coroner then charged the jury, and said he saw no reason to attach suspicion to any one in particular, and the total absence of motive rendered the sad affair almost inexplicable.

In accordance with this direction, the jury returned a verdict of willful murder against some person or persons unknown. The result was received with the greatest dissatisfaction. The Coroner was accused of burking the inquiry, and his refusal to examine Mr. Kent was severely commented upon. The magistrates opened a preliminary inquiry, and Gough, the nurse, was taken into custody, but no formal charge was made against her, and she was speedily released. Scotland Yard now felt it was time to step in, and on the 15th of July, Inspector Whicher, of the metropolitan detective force, appeared upon the scene. . . . This reënforcement was productive of speedy results; within five days Miss Constance Kent was arrested and lodged in Devizes Gaol, and on the 27th she was brought before the local bench.

To fully understand the significance of this arrest some detailed reference to family history will be necessary. A deep gloom had been cast over the early married life of Mr. Kent by the prolonged illness of his first wife. After she had become the mother of the two elder girls mentioned above, and of a boy named Edward, signs of insanity showed themselves, but she was not placed under any restraint, and between the years 1837 and 1842 she gave birth to four children, none of whom survived for more than a few months. In 1844 Constance was born, and in 1845, William; but from this period her mania became

so acute that she was entirely secluded, and the care of the establishment devolved upon a Miss Pratt, the governess and companion. In 1852 Mrs. Kent died, and in the following year Mr. Kent married Miss Pratt. The two eldest girls seem to have got on well enough with their stepmother, and though the eldest boy, a sailor, is said to have shown some disrespect to the governess promoted to fill his mother's place, a reconciliation had taken place prior to his death abroad in 1858, and his last letters to his father were full of affection. With Constance it was otherwise; from her earliest childhood she had been brought up by her stepmother in her capacity of governess; the discipline of the schoolroom is not always compatible with filial affection, especially in the case of a girl of sullen and reserved disposition; and in the month of June, 1856, an extraordinary adventure was planned and carried out. One day Constance, then only twelve, disappeared with her brother William, and was not heard of till the next morning, when news came that the children, both in boy's clothes, had arrived at the Greyhound Hotel at Bath and asked for beds. Their appearance excited suspicion, and they were questioned by the landlady. William soon broke down in tears, but Constance preserved her self-possession, and was even insolent in manner and language. She spent the night at the police station, maintaining the same defiant bearing. In the morning they were fetched home, but Constance could not be induced to express shame or regret. It was discovered that she had secreted and mended some clothes of her brother's, had cut off her hair and thrown it away, together with her own clothes, in that very closet in the shrubbery where the murdered body of little Savile was afterwards found. This escapade became the talk of the neighborhood, and was, no doubt, the foundation of the sus-

pitions which at once attached themselves to these children, and which found vent in the disorderly scene at the inquest.

Since then, an additional circumstance had come to light. On the Monday after the murder, the laundry woman, Mrs. Holly, went as usual to fetch the linen from Road Hill House, and on bringing it home compared it with the list, and found that though a nightdress of Miss Constance's was entered there, no such garment could be found in the basket. The next day she came up to the house and informed Mrs. Kent of the discrepancy. There had been previous disputes about articles lost at the wash; the Kents were indignant, for the housemaid perfectly remembered putting Miss Constance's nightdress into the basket; and Mr. Kent said that unless it was returned in forty-eight hours he would take out a search warrant. Whether this impressed the local police force does not appear, . . . but Whicher's inquiries elicited the following facts. While the housemaid was getting ready the linen basket, but had not quite finished packing it, Constance came to the door of the lumber room and asked her to look in her slip pocket and see if she had left her purse there. Cox looked in the basket unsuccessfully, and then Constance asked her to go down and get a glass of water; she did so, and in about a minute returned with the water, which Constance drank, and then left the room, going up the backstairs to her own apartment. On the 16th Whicher had an interview with Constance, and pointed out the linen list which showed three nightdresses belonging to her; she replied that she had only two as the other was lost at the wash the week of the murder. After a renewed search no trace of the missing garment could be found, and on the 20th Constance was arrested; she cried and said she was not guilty.

At the consequent hearing before

the magistrates, Elizabeth Gough, who after her discharge from custody had gone back to the Kents, was the first witness. She gave substantially the same evidence as on the previous occasion. Then came two of Constance's schoolfellows, unearthed by the vigilance of Whicher. One of them, Miss Moody, said: "Constance told me she disliked her younger brothers and sisters. I believe it was through jealousy, and because the parents showed great partiality. I have remonstrated with her on what she said. I was walking with her one day, and said, 'Won't it be nice to go home for the holidays so soon?' She replied, 'It may be to your home, but mine's different.' She also led me to infer, though I don't remember her precise words, that she did not dislike the child, except for the partiality shown by the parents, and because the second family were much better treated than the first. I remember no other conversation about the deceased child; she has only very slightly referred to him." These peevish outbursts were a very fragile foundation for a charge of murder; but the other schoolgirl, Miss Hatherall, said even less. She had heard Constance speak of her home, and say there was a partiality shown by the parents for the younger children, and that her father would compare the elder son to the younger, and say what a much finer boy the younger would be. Constance had never said anything particular to her about the deceased.

Mr. Parsons, besides repeating his testimony as to the cause of death, said that he accompanied Foley in searching the house on Saturday, the 30th of June, and went with him into the prisoner's room; he examined the linen in her chest of drawers, and the nightcap and nightgown on the bed; they were all perfectly free from any stains of blood; the nightdress was very clean, so much so that he remarked

upon it at the time; the starch was not so much gone from the waist bands and frills as you would expect if it had been worn from the Saturday before. Then followed the story of the missing nightdress as we have detailed it; but there was nothing to bring home the abstraction of the garment to Constance; no trace of it had been discovered; the occurrence was in no way inconsistent with ordinary incidents of a family wash with a not too careful laundry woman.

After a brief appeal from Mr., now Sir Peter, Edlin, who represented the prisoner, she was discharged, on her father entering into recognizances of £200 for her appearance if called upon. The decision was received with applause; public opinion had shifted, and suspicion was falling on another quarter. It was said on all sides that the grounds of accusation were frivolous, and the evidence childish. Whicher was overwhelmed with abuse for officious bungling.

Incredible as it may appear, the next victim sought out by popular rumor was Mr. Kent himself. . . . For some reason he was unpopular in the village; the house had a reputation for never keeping servants; and utterly groundless charges of profligacy were suddenly heaped upon this unhappy man. Gradually a specific charge shaped itself; there were undoubtedly grounds for suspicion against Gough, the nurse; the abduction of the child from her room, the length of time that elapsed before she gave the alarm, and her somewhat lame explanations. . . . Mr. Slack, a solicitor from Bath, had taken up the case in place of Whicher, dismissed with opprobrium. As a result of his investigations Gough, who was now in service near Isleworth, was apprehended and brought before the magistrates early in October. . . . Into the details of the inquiry it is not necessary to go. Suffice it to say that after a four days'

hearing Gough was liberated, on recognizances for her future appearance being entered into. . . . Nearly thirty witnesses were examined, and it is not too much to say that not a single new fact was elicited. Mr. Parsons, however, now expressed himself as of opinion that the cause of death was suffocation, and that the wounds had been inflicted subsequently. . . . The prosecuting counsel went out of his way to express his conviction of the innocence of Constance Kent; she was called as a witness, and testified as to her fondness for little Savile, and that on the very evening of the murder they had been romping together. . . . The mystery was put aside as insoluble, and newspaper readers had plenty of other matter to occupy their thoughts.

Suddenly the silence was broken and the mystery dissipated. In the last week of April, 1865, the London press made known to its readers that Constance Kent had confessed. . . . For years nothing had been heard of the Kent family; they had left Wiltshire and were residing somewhere in Wales, but, since that terrible summer, Constance had ceased to live with them. She had been for some time in a convent abroad, but in 1863, she came as a guest to St. Mary's Home, Brighton, an Anglican sisterhood. . . . In the course of the Holy Week, of 1865, she informed Miss Gream (the Lady Superior), and subsequently, Mr. Wagner (curate of St. Paul's connected with the Home), that it was her desire to surrender herself to justice. . . . On the 20th of July, five years to the day since her former arrest, she was placed at the bar. . . . On being called upon to plead, she said Guilty in a low tone. . . . Before her disappearance into penal servitude, Constance made a full confession to Dr. Bucknill, the medical man who was sent to examine into her mental condition. Let us read in her own words how the crime was committed:

A few days previous to the murder she got possession of a razor from her father's wardrobe and secreted it. On the night itself she undressed and went to bed; she lay awake until the household were all asleep, and soon after midnight she left her bedroom, went downstairs and opened the drawing-room door and window shutters. She went up into the nursery, withdrew the blanket from between the sheet and counterpane and placed it on one side of the cot. She then took the sleeping child from his bed, covered him with the blanket, and carried him downstairs to the drawing-room; she was in her nightdress, and in the drawing-room she put on her goloshes. Having the child in one arm, she raised the drawing-room window with the other, stepped out, went round the front of the house to the closet, lighted a candle which she had secreted there, and while the child, wrapped in the blanket, was still sleeping she inflicted the wound on its throat. It seemed to her as if the blood would never come, and she thrust the razor into the left side. Then she dropped the body, with the blanket round it, into the vault, went back to her bedroom, examined her nightdress and found only two spots of blood upon it. These she washed out and

threw the water away; she put on another of her night-dresses, and got into bed. In the morning her nightdress had become dry where it had been washed. She folded it up and put it into the drawer, as she thought the blood stains had been effectually washed out, but on holding the dress up to the light a day or two afterwards she found the stains were still visible, so she secreted it, moving it from place to place, and five or six days afterwards burned it in her own bedroom, and put the ashes or tinder into the kitchen grate. She had abstracted the nightdress put on after the murder from the clothes basket when the housemaid went to fetch a glass of water. The stained garment found in the boiler hole had no connection with the deed. She replaced the razor on the Saturday morning after cleaning it.

As regards the motive of the crime, says Dr. Bucknell, it seems that though at one time she entertained a great regard for her stepmother, yet if any remark was at any time made which in her opinion was disparaging to any member of the first family, she treasured it up and determined to avenge it. She had no ill will against the little boy except as one of the children; and he failed utterly to detect any trace of insanity in her.

112. STEVENSON v. STEWART. (1849. SUPREME COURT OF PENNSYLVANIA. 11 Pa. 307.) . . .

This was an action of debt on a single bill, brought by the administratrix of John A. Stewart, to whom or whose order the bill was made payable, against Stevenson, the maker. The bill was dated July 6, 1844. The defendant pleaded "non est factum," alleging that the bill was a forgery. The plaintiff called several witnesses, who testified that they would take the signature to the bill to be the handwriting of the defendant; and the bill was read in evidence to the jury. The defendant then introduced several

witnesses to prove that he was not in the county at the date of the single bill; he proved and gave in evidence several receipts and letters, to which his signature was attached and undisputed, for the jury to compare with the alleged signature to the bill; and also proved, that this single bill was not exhibited by the administratrix to the appraisers of the estate of the deceased; and rested. The plaintiff then called John Cook, and proposed to ask the witness whether the defendant asked the witness to loan him money in the

year 1844, and to follow this with testimony that defendant wanted to borrow money both before and after the date of this single bill. The counsel for defendant objected to the evidence offered. The Court overruled the objection, and admitted the evidence, and sealed a bill for defendant. The witness then went on to state that he had loaned defendant money; that he loaned him \$40, and took his note when he was in Philadelphia, in June, 1844. The verdict was for the plaintiff. The error assigned in this court was, the admission of the evidence of Cook.

Watson & Maynard, for plaintiff in error. *Armstrong*, contra. The opinion of this court was delivered by

BELL, J. — It is, undoubtedly, a rule governing the production and admission of evidence, that the evidence offered must correspond with the allegations and be confined to the point in issue. The effect is to exclude merely collateral facts, having no connection with the subject litigated, and, therefore, incapable of shedding light upon the inquiry, or affording ground for reasonable presumption or inference. . . . But it by no means follows that all collateral facts, presenting at first view no direct connection with the principal fact, are irrelevant, and therefore inadmissible. On the contrary, great latitude is allowed to the reception of indirect, or, as it is sometimes called, circumstantial evidence, the aid of which is constantly required, and, therefore, where direct evidence of the fact is wanting, the more the jury can see of the surrounding facts and circumstances, the more correct their judgment is likely to be. . . .

In the case at bar, the question is of the alleged forgery of the defendant's signature to a promissory note, averred to have been given for money loaned. Such investiga-

tions, founded in imputed fraud, naturally take a wide range. Among the most common topics of inquiry is the pecuniary capacity of the supposed lender, and the necessitous condition of the alleged borrower. And these inquiries are legitimate. It is surely competent for the defendant to show that the plaintiff was, at the time of the alleged lending, a poor man, and probably unable to loan the sum in question; or that the defendant was himself possessed of money, and therefore not driven to the necessity of using his credit. If so, why should not the plaintiff be at liberty to prove, that about the critical time the defendant was seeking to borrow? Standing unsupported, neither line of evidence would be sufficient to rebut the adverse allegation. But yet all must feel, that, in a doubtful case, the facts I have supposed to be made out by the defendant, would go far to determine in his favor. On the other hand, where the proofs were otherwise in equilibrium, the fact I have thought the plaintiff might show, would, unquestionless, furnish an argument of some weight in his scale. Had the defendant's effort been to borrow from another the sum for which the note was subsequently given, the inference deducible from the fact would, doubtless, be more stringent than where, as here, the sum first sought for is much smaller than the amount called for by the note. But the convincing power of the inference is for the jury, when weighing the value of the fact proved; not for the judge, in determining the bare question of its relevancy. It is sufficient for the purposes of his inquiry, that it has some affinity with the principal inquiry, though this may be weak or remote. Such we think was the condition of the evidence received here; wherefore, judgment affirmed.

113. **COMMONWEALTH v. JEFFRIES.** (1863. SUPREME JUDICIAL COURT OF MASSACHUSETTS. 7 All. 548.)

Indictment for obtaining goods by false pretenses. . . . At the trial in the Superior Court, before RUSSELL, J., George M. Barnard was called as a witness, and the material portions of his testimony were as follows: "I knew and had dealt largely with the defendant as a broker in linseed, and only as a broker, except in one instance in 1861. He came to my counting room on the 19th of August last, and asked whether I was disposed to sell linseed? I said I would not sell at the price quoted, \$2.90. I said, 'I suppose they will give only \$2.90 and I am not willing to sell.' He said he had an order from parties in New York for two thousand bags of linseed; and after some conversation he said, 'At what price will you sell it?' I said, at \$3.00 a bushel. I think I said, 'Can you buy at \$3.00?' He said, 'Yes; that he could buy of the Tudor Company and William Perkins at that price.' I said, 'I will sell at \$3.00, but I want the money immediately.' He said vessels were scarce, and that there might be some delay in getting vessels to haul to East Boston and take the seed, but that he would send to New York and get the notes of the parties discounted, and so get the money certainly within a week. He said the parties did not wish their names disclosed, as they were constantly using large quantities of seed, and did not wish to be known in the market as buyers. I then made an entry in my memorandum book, in his presence, as follows, to wit: '19th August. Sold to E. P. Jeffries & Co. 2000 bags linseed at \$3.00. Cash within ten days. E. P. J. $\frac{1}{2}$ Secret.' The word secret refers to the price. The meaning of 'E. P. J. $\frac{1}{2}$ ' is, that he was to have $\frac{1}{2}$ per cent brokerage. I do not know that the defendant saw this entry made. If I sold to a broker for himself, I

should make the entry '\$3.00 less $\frac{1}{2}$ per cent.' The buyer claims that if we save brokerage, he is to have the $\frac{1}{2}$ per cent though not as brokerage. The linseed was to be sound. That is always understood, unless something else is expressed. In the course of business, linseed is used by the crushers to extract the oil by crushing. I knew all the crushers in New York, I think, and have made myself acquainted with their standing and business credit. After making the entry in the memorandum book, I gave him an order on the warehouse man as follows, to wit: 'Boston, August 19, 1863. Please deliver to the order of Messrs. E. P. Jeffries & Co. two thousand bags linseed, per ship *Resolute* from Calcutta. (B.^{R.}_{R.}^{H.}) George M. Barnard.' 'B. H. R.' means, Barnard & Hunnewells, per *Resolute*.' . . . The government proved that upon the foregoing order and the order hereinafter referred to relating to the second purchase, the defendant caused the seed to be removed from the warehouse and shipped to New York, to Messrs. T. & G. Rowe and to Messrs. Campbell & Thayer, and introduced evidence tending to show that he afterwards sold the seed to them at a less price than the same were sold by Barnard, on the same days on which he bought of Barnard. . . .

The District Attorney then offered in evidence the defendant's petition in insolvency, with his schedule of creditors and of assets, signed and sworn to by him; the petition on the 14th of September, and the schedule on the 21st of September, 1863; and offered to prove that his indebtedness was not materially different on the 19th and 21st of August, when the transactions with Barnard took place, and that on the 19th and 21st of August, the defendant was in fact deeply insolvent. The Judge admitted this evidence,

against the defendant's objection, solely as tending to prove the intent of the defendant at the time of making the representations alleged. At a subsequent stage of the trial, the said Barnard explained that he was induced to part with the thirteen hundred and seventy bags on the expectation of receiving \$3.00 per bushel from the purchaser in New York, founded upon the representations of the defendant already herein before testified to by him. . . .

The case was submitted to the jury under instructions to which no special exception was taken, and a verdict was returned of guilty upon the first and second counts, and not guilty on the third. The defendant alleged exceptions, and moved in arrest of judgment.

B. F. Thomas & E. D. Sohler, for the defendant. . . . The evidence of the defendant's insolvency was incompetent. . . . It had no tendency to show a fraudulent intent on the part of the defendant. Yet this is the precise point in reference to which it was admitted. There is no authority in support of the ruling. Poverty cannot be shown for the purpose of proving crime. It is impracticable to administer justice on such a principle. Before the law, the rich and poor stand on an equality. . . .

Foster, A. G., for the Commonwealth. . . .

BIGELOW, C. J. . . . The indictment is for obtaining goods by false pretenses. At the trial in the Superior Court, the evidence offered in support of the prosecution tended to show that the defendant, being by occupation a merchandise broker, falsely pretended and represented to the prosecutors that he was authorized as the agent and broker of certain persons in New York, whose names he did not disclose, to purchase a large amount of linseed at the price of three dollars per bushel; that the prosecutors, believing these pretenses and representations to be true and relying upon them, did

agree to sell to said persons in New York for whom the defendant purported to act, several thousand bags of linseed at the price named by the defendant; and that in pursuance of such agreement, they did deliver the same to the defendant, who by means of said false representations and pretenses received and obtained said merchandise with intent to cheat and defraud the prosecutors thereof. . . .

We next come to the consideration of an exception on which great stress has been laid by the learned counsel for the defendant. It is founded on the admission of evidence to prove that at the time of making the alleged false representations the defendant was deeply insolvent. This fact was offered in proof by the government as tending to show the fraudulent intent of the defendant in making such false statements, and was held by the court to be competent for that purpose. It is doubtless true that in a large class of cases the poverty or pecuniary embarrassments of a party accused of crime cannot be shown as substantive evidence of his guilt. The reason of the exclusion of such evidence is, that in those cases there is no certain or known connection between the facts offered to be proved and the conclusion which is sought to be established by it. To render evidence of collateral facts competent, there must be some natural, necessary, or logical connection between them and the inference or result which they are designed to establish. It does not follow because a man is destitute that he will steal, or that when embarrassed with debt and incapable of meeting his engagements he will commit forgery. The conclusion in such cases is too remote and uncertain a deduction to be legitimately drawn from the premises. . . . But as a safe practical rule it may be laid down that in no case is evidence to be excluded of any fact or circumstance connected with the

principal transaction, from which an inference as to the truth of a disputed fact can reasonably be made. This rule is especially applicable when it becomes necessary to show a particular intent in a party as an essential ingredient in the crime with which he is charged. . . . Limited strictly to this purpose, other criminal acts have a direct relation to the particular accusation under investigation, and tend to prove the substance of the issue, because they show the state of the mind of the accused in committing the act with which he is charged. . . .

If these views are correct, and we cannot doubt that they are, there is no room for question as to the correctness of the ruling of the court in admitting evidence of the defendant's insolvency. . . . The inability of the person making the false pretense to pay for the goods which he has received becomes a significant circumstance bearing on his intent, and tends to show that the pretense, which otherwise would be innocent or harmless, was made for the purpose of accomplishing a fraud. The insolvency of the party has a direct tendency to show the intent with which the false pretense

was used. . . . If at the time of the transaction he was deeply insolvent, and was cognizant of his condition, the necessary consequence of the act was to deprive the vendor of his property without recompense or the chance of payment, and leads to the just and almost unavoidable inference that it was done with an intent to defraud. Evidence of the pecuniary condition of the accused in such a case is not offered to show that he was under a peculiar temptation to commit the offense, or was more likely to cheat and defraud because he was in embarrassed circumstances, but for the purpose of showing the natural and necessary consequence of his act, which the law presumes he intended. The distinction between the motives which impel a man to commit an act and the effect which he intends his act shall produce on a third party is clear and obvious. Poverty or pecuniary embarrassment may be incompetent to prove the former, but direct and forcible evidence of the latter. . . . For this reason, without enlarging further on the point, it seems to us that the evidence objected to was clearly competent, and had a direct tendency to prove a material issue in the case.

114. BRADBURY v. DWIGHT. (1841. SUPREME JUDICIAL COURT OF MASSACHUSETTS. 3 Metc. 31.)

Assumpsit to recover back money alleged to have been paid by the plaintiff to the defendant, upon a consideration which had in part failed. At the trial, in the court of common pleas, before STRONG, J., the plaintiff introduced evidence tending to prove that in December, 1839, he contracted with the defendant for \$300 worth of wood, at \$1.25 per cord, to be cut on the defendant's land, for which the plaintiff gave his promissory note to the defendant, payable in sixty days, and paid the note soon after it fell due. The plaintiff gave evidence of a negotiation between him and the

defendant respecting the purchase of the wood, and introduced a witness, who testified that he (the witness) called upon the defendant, by direction of the plaintiff, and gave to the defendant the above-mentioned note, signed by the plaintiff and by the witness and another person; that the witness took from the defendant a bill of sale of the wood, and carried and delivered it to the plaintiff. Evidence being given that the bill of sale had been lost since the commencement of this action, the witness was permitted to testify as to its contents; and he stated that it purported to be a bill of sale

of \$300 worth of wood, to be cut and taken from a certain lot belonging to the defendant, by the 1st of June, 1840. The defendant contended, and offered evidence tending to show, that the contract between him and the plaintiff was for all the wood standing on the said lot, whether more or less, without any agreement as to the quantity for which the sum of \$300 was to be paid. The plaintiff gave evidence, that there was not on said lot wood enough to amount to \$300, at \$1.25 per cord; and that he, on the 15th of June, 1840, demanded of the defendant a return of part of the money he had paid, or that the defendant should show him where he could procure more wood. In the course of the defense, the defendant offered evidence to prove that the wood, on the lot upon which the plaintiff cut, "was of far greater value than \$1.25 per cord, for the purpose of showing the probability that the contract was such as he alleged it to be, and that it was not according to the claim of the plaintiff." This evidence was rejected by the Judge, and the plaintiff obtained a verdict. The case was brought into this court on exceptions to the rejection of this evidence.

C. Allen, for the defendant.
Merrick, for the plaintiff.

PUTNAM, J. — This controversy has grown out of a contract between the parties concerning a sale of wood standing on the defendant's land, and to be cut down by the plaintiff. A bill of sale was given by the defendant to the plaintiff, which expressed the terms of the agreement. But the paper has been lost, and the parties are at issue on its contents; the plaintiff insisting that it was for \$300 worth of wood, at \$1.25 per cord, and the defendant maintaining, on the contrary, that it was for all the wood on a certain lot, for which the plaintiff was to pay, and has paid, \$300. It now appears that there was not wood enough on the lot to amount to the sum of \$300,

paid at the rate of \$1.25 per cord, and that the plaintiff gave notice of that fact to the defendant, fifteen days after the expiration of the time within which the wood was to be cut and taken away, and requested the defendant to show to him and permit him to cut wood on another lot sufficient to make up the deficit, or to return it in money. The witness, who undertook to testify as to the contents of the bill of sale, said that it purported to be a sale of \$300 worth of wood, to be taken from a certain lot of the defendant by the 1st of June next after the time of the sale, which was in December, 1839. Now, if that was the contract, it would be satisfied by the plaintiff's taking all the wood which was on the lot, although it might be of less value than \$300. That witness did not state that the wood was to be at a certain rate per cord. He stated that the plaintiff paid \$300 for the wood; and if the case rested there, the plaintiff would have no just claim against the defendant. But if the contract was for \$300 worth of wood, on a certain lot, at a certain rate per cord, and there was a deficiency, it would be clear that the plaintiff, upon reasonable notice and request, would be entitled to recover the amount of that deficiency, as for money paid upon a consideration that had failed to that extent. The question at the trial was, What were the terms of the agreement?

The defendant offered to prove that the wood, which the plaintiff cut down in his lot, was of far greater value than \$1.25 per cord, as it stood, for the purpose of proving his own statement of the agreement, and disproving the claim of the plaintiff. But the Court rejected that evidence. And the question now is, whether it should have been admitted. If the inference properly to be drawn from the fact tended to prove the agreement to be such as the defendant contended that it was, then it should have been admitted; other-

wise, it should have been rejected as irrelevant, and as having a tendency to mislead. Now the presumption which arises from the uniform conduct of men, under a given state of facts, enters essentially into almost every cause which is tried. Very few cases are established by positive proof. If the fact, alleged by one party and denied by the other, be unusual, unaccountable, and not warranted by the circumstances which attended the transaction, it will not be likely to obtain credit with the jury. If (to come home to the question) the wood, which was standing on the defendant's lot, was worth far more than \$1.25 per cord — and we must now take the fact to be so — is it reasonable to suppose and presume that he would have sold it at that reduced price? We cannot think that such a presumption could be raised from such premises. Suppose the evidence

would have proved that the wood was worth \$2.00 a cord: a sale for the price at which the plaintiff alleges that it was rated would be contrary to the uniform course and conduct of men. The rejected evidence would indeed only raise a presumption, which might be rebutted by some particular circumstances that might have operated upon the defendant to sell for less than the known value. But this would not affect the admissibility of the evidence. The fact should be submitted to the jury, to be properly weighed by them. And if it were established, and not explained or rebutted, it would certainly have a tendency to disprove the allegation of the plaintiff, that the contract was for a price per cord greatly less than the common value. The verdict is set aside, and the case remitted to the Court of Common Pleas for a new trial.

115. **MARCY v. BARNES.** (1860. SUPREME JUDICIAL COURT OF MASSACHUSETTS. 16 Gray 161.)

Action of Contract. Trial and verdict for the plaintiff in this court, before HOAR, J. The defendants alleged exceptions, the substance of which is stated in the opinion.

P. C. Bacon, for the defendants.
C. Devens, Jr., & G. F. Hoar, for the plaintiff.

MERRICK, J. — This is an action to recover the contents of the promissory note declared on, purporting to be signed by all the defendants. Zephaniah Baker & Co. were defaulted, and Moses Barnes alone interposed any defense. In his answer, he denied the genuineness of the signature of his name which appears upon it, and alleged that it had been fraudulently placed there. This constituted the issue to be determined; and it was conceded at the argument by the counsel of both parties, that the precise question which arose and was contested upon the trial was whether the

name of Moses Barnes was affixed to the note before or after it came into the possession of the plaintiff.

In addition to other evidence produced by the plaintiff, Lucian Marcy was called as a witness in his behalf, and testified that he was present on a certain occasion, and heard the plaintiff, in reference to a loan about to be made by him to Z. Baker & Co., make inquiries of his father respecting their credit; that his father replied that he would not trust them a dollar; that he then said he was to have the name of Moses Barnes; and that his father said Moses Barnes was good. This conversation was not in the presence or knowledge of either of the defendants; and the whole of this testimony was objected to by the defendant Barnes. But of the admissibility of a part of it we can entertain no doubt. It was competent for the plaintiff to show that, before parting with his money, he exercised

the reasonable precaution of making himself acquainted with the pecuniary responsibility of the parties to whom it was to be lent; and proof that he obtained information from a person, upon whose knowledge and judgment he believed he could confidently rely, that Baker & Co., were worthless and unfit to be trusted, but that Moses Barnes was a man of undoubted credit and ability, would have a tendency to create a high degree of probability that the loan would not have been made without the security afforded by his becoming a party to the note, and thus to show that his name must have been upon it when it was taken. This would be in conformity to the

common experience, that men of ordinary prudence consult their own interest and use reasonable care in securing and preserving their own property, and therefore was a circumstance which, though by no means conclusive, yet had an important bearing upon the question at issue. 1 Starkie, Ev. (1st Amer. ed.) 487. And upon such a question evidence of inquiries made by the party in interest, and of the information obtained in reply, is not obnoxious to the objection that it is mere hearsay, but is primary and original. The whole, taken together, is a fact, which, like any other fact, may be shown and established by any competent means of proof.

Topic 3. Plan (Design, Intention)

121. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹ The existence of a design or plan to do or not to do a given act has probative value to show that the act was in fact done or not done. A plan is not always carried out, but it is more or less likely to be carried out.

The probative value of such a design or plan, for the purpose of admissibility, will depend chiefly on two elements, either of which may be very weak in a given instance, — the fixedness or absolute quality of the design, *i.e.* its subjection to no contingencies or conditions; and the specific direction of it to the act in question, *i.e.* its application, not merely to a class of acts indefinitely foreseen, but to the exact deed in question.

The nature of the inference by which we reach a belief in the existence of the plan has been already examined under Title III, Evidence of a Human Quality or Condition, Subtitle D, Plan (*ante*, No. 39).

122. JAMES SULLY. *The Human Mind*. (1892. Vol. II, p. 255.) . . . The process of active deliberation here briefly described is a higher form of that work of integration or unification in which, as we saw above, the whole development of consciousness consists. To reflect upon our competing impulses and aims is to make them our own, that is, to take them up as elements in a new mode of self-consciousness. . . . *Choice or Decision*. Where the process of deliberation has been carried out normally, that is, in strict subordination to practical ends, it leads on to what is popularly known as an act of choice or decision. Thus, after duly weighing the pleasure and the pain, the good and the evil which will result from any action, the one may seem to preponderate over the other; or, after comparing two competing forms of good, say society and the furtherance of science, we recognize the latter as the greater. In such cases we are said

¹[Adapted from the same author's *Treatise on Evidence*. (1905, Vol. I, § 102.)]

to consciously choose or decide upon the particular course of action with its attendant result. Here, it is evident, we reach a higher degree of organization of the conative process. . . .

Resolution: Firmness of Will. One other common accompaniment of this higher and more reflective type of conation remains to be touched on, namely, resolution. By this is meant the formation of a distinct determination to perform an action which is seen to lead to a desired end. It is something more than selectively deciding on an end as good or desirable. Such decision, where the actual circumstances allow, may instantly pass into action, as when, for example, a gambler decides to stake a particular sum and instantly places this amount. Here, it is evident, there is no time for a resolution, "I will do this particular act," to distinctly emerge in consciousness. In its completely developed form, resolution, like the state of desire itself, has reference to something not capable of being realized at the moment. Thus we resolve to pay a call some hours hence, or to meet some contingency as a wet day, or another person's treatment of us, in a particular way.

Resolution on its psychical side, is equivalent to a complete process of volition. There is not only the presence and unopposed preponderance of a motive to action, but a distinct representation of, and desire to perform, an appropriate action. What differentiates it from a fully executed action is that owing to the circumstances of the moment the motor idea does not instantly issue in the conscious action. . . . On the physiological side resolution appears to involve a partial excitation of the motor and sensory centers engaged in carrying out the action, an excitation which is temporarily inhibited by a reflective process, though steadily maintained through the psychophysical process of expectation, and ready to overflow into peripheral discharge as soon as this ideational process of expectation gives place to the sensational process of a perception of the suitable circumstances.

From this brief account of the process of resolution we may readily see that it is in a manner the crowning phase of the conative process. Action kept, so to say, in suspense prolongs the initiative stage to the utmost. Such prolongation or delay of execution allows of full opportunity for the development of the active form of self-consciousness. The state of mind or psychosis indicated by the expression "I will" here reaches its maximum distinctness. Hence the tendency to look on resolution as the most essential factor in the conative process. According to this common view, we only fully assert our will when we definitely and firmly resolve to do a thing. . . .

It may be added that resolution enters into all action, so far as this becomes complex, in the sense of involving a *prolonged activity*, or a series of combined movements. Thus, in carrying out a mechanical process as carpentering, in looking up a friend, or in preparing for an examination, we must, it is plain, maintain from the outset a state of determination or resolution with respect to the latter stages of the performance. The frequency of incompleted action illustrates this point; for the abandoning of things when only partly done means that the attitude of resolution was not strong enough; that is to say, that the desire for the end, the achieved result, and the readiness to carry out the required actions as the proper moments arrive, were not sufficiently persistent. . . . Since resolution implies the

maintenance of the idea of an end, and further of that of an opportunity of actively realizing this end, it is liable to fail through the lapse of this ideational activity. Hence so many of our resolutions are temporary only and abortive. Again, since resolutions are arrived at in the absence of the appropriate circumstances, they are, even when strong and persistent, no perfect guarantee for actual performance. Their future efficiency will depend on the adequate representation of all the circumstances. This accounts for the ignominious collapse of so many brave resolutions when subjected to the touchstone of actuality. In all such persistent resolution we have a new display of "will power." Strength of will is commonly judged by steadiness and pertinacity of resolve. More particularly, it is tested by firmness, that is, maintenance of the resolute attitude under heavy and prolonged discouragements, as in the now historical crossing of the African forest by Stanley and his party. . . . Where, instead of deterrent difficulty, seductive allurements of any kind come in to break the spell of a resolution, we have this pertinacity under the form of what is commonly known as firmness or independence of will. Here the attractions of other objects, the suggestions of friends, and so forth, present themselves as competitors with the particular end pursued, as when the Sirens seek to woo Ulysses from the arduous toils of the sea. . . . Such resoluteness or firmness constitutes a particular volitional quality. . . . It is needless to dwell on the moral importance of the quality. It is only as men are known to be resolute that they are to be counted on.

123. RICHARD GOULD'S CASE. (CAMDEN PELHAM. *Chronicles of Crime*. ed. 1891. Vol. II, p. 557.)

It was upon the morning of Tuesday, the 17th of March, 1840, that the murder was discovered for which Gould was eventually indicted. Mr. John Templeman, the unfortunate victim of this most dreadful crime, was about seventy years of age at the period of his death. He resided in one of numerous small cottages erected in an open space called Pocock's-fields, near Barnsbury Park, Islington, principally occupied by persons of the poorer grades of life. He lived by himself, and was possessed of a small income, arising from the rents of one or two houses which belonged to him in Somers Town. The supposed miserly habits of the old man, and the great desire which he appeared to entertain to be considered rich, and which he exhibited by constantly boasting of his property, were the undoubted causes which led to the dreadful catastrophe by which he was deprived of life.

It appears that on Monday, the 16th of March, he went as usual to Somers Town to collect the money due to him for the rent of his houses; and having called upon his tenants, he received of them 6*l.*, the whole of which was paid him in silver, except one half sovereign. Upon his return home, he sent for a Mrs. Thornton, who acted as his charwoman, and who lived in an adjacent cottage, to whom he communicated the fact of the receipt of the money; and having instructed her to procure various trifling articles of which he stood in need, at about six o'clock he retired to rest. On the following morning Mrs. Thornton sent her daughter to the house of the deceased with some of the commodities which she had been directed to purchase, and she knocked at the door, and called Mr. Templeman by name. No answer was returned, and she went back and informed her mother of her inability to

obtain admittance to the house; and then upon Mrs. Thornton proceeding to the cottage and looking in at the bedroom window, she was horror-stricken at finding the unfortunate old man stretched upon the floor brutally murdered. For a time she was at a loss to know what proceedings to take in reference to this most dreadful transaction; but being aware that the deceased had a grandson, a solicitor, in Mortimer-street, Cavendish-square, she determined to await the arrival of her son-in-law, a Frenchman, named Capriani, who was employed as a night watchman at Sadler's Wells theater, in order that he might take the necessary steps in the affair. At eleven o'clock in the day he returned home; and then upon his being made acquainted with what had occurred, he at once proceeded to the residence of Mr. Templeman, Jr., to inform him of the murder, omitting altogether to give any information to the police of the discovery which had taken place. During the absence of Capriani, the baker who was in the habit of delivering bread at the cottage of the deceased arrived, but was met by Mrs. Thornton, who sent him away, saying he would get no answer there; but Mr. Templeman, Jr., soon after making his appearance, the police were called in, and informed of the horrid transaction.

A minute examination of the house of the deceased then took place; and from the appearances which presented themselves, it became evident that the murder had been committed in the most savage manner. . . .

The house, which consisted of two rooms only, was in a state of great confusion. The drawers had been forced open, and the box in which it was known the deceased kept his money had been ransacked of its contents. . . . Upon the search being continued, to ascertain the means by which ingress had been obtained to the house, it was discovered that

the outer shutter, which was of slight materials, having been first forced open, a pane of glass in the parlor window had been broken through, and then a hand might have been introduced to open the door on the inside.

The circumstances which had hitherto been disclosed left but little clew to the murderer, but some suspicion being attached to Capriani from the delay which had taken place in the discovery of the murder by him to the police, he was taken into custody. The examinations which were made by the police in the course of the ensuing day or two, however, satisfactorily proved that Capriani was in no wise implicated in the horrid affair, and he was discharged; but soon afterwards Gould, and a man and his wife, named John and Mary Ann Jarvis, were apprehended. The evidence which was discovered in reference to these persons soon demonstrated the innocence of the man Jarvis, and he was set at liberty; and subsequently, although a close intimacy was proved to exist between Gould and Mrs. Jarvis, it was found that no such proofs remained against the latter as to induce a probable belief of her guilt, and she too was discharged from custody.

Gould, in the meantime, underwent many examinations at Hatton-Garden police office, upon the charge of being concerned in the murder, the utmost interest and excitement being occasioned by the mystery connected with its committal.

The case came on to be tried before Mr. Baron ALDERSON, at the Central Criminal Court, on Tuesday, the 14th of April, Mr. Chadwick Jones appearing as counsel for the prosecution, and Mr. Chambers conducting the defense of the prisoner. Witnesses were examined as to the facts which have been already detailed; and other persons were produced, from whose testimony it appeared that the prisoner for some time before the murder had

lodged in the house of a Mrs. Allen, who lived in Pocock's-fields, near the cottage of the deceased. The most important facts proved against him were, that previous to the murder he had frequently declared to many of his companions that he was greatly in want of money, and that he had suggested to one of them, a potboy at the Duchess of Kent public house in the Dover-road, that he knew an old man who had got money, for that he had seen him flashing about a 50*l.* note; that he knew where to put his hand upon it in the drawer where it was kept, and that it was "just like a gift" to him, and that he wished he could get "a right one" to assist him in the robbery. Other witnesses proved that he had expressed to them a desire to procure "a screw" and "a darkey" (meaning a picklock key and a dark lantern), to "serve" an old gentleman in a lonely cottage; and the concluding evidence was that of Mr. and Mrs. Allen, his landlord and landlady, as to his conduct on the night of the murder, and of some police officers, who proved the discovery of some money in the rafters of the washhouse of Allen's cottage, corresponding in its denominations with the silver which had been paid to Mr. Templeman by his lodgers at Somers Town.

Allen's evidence was as follows; "I live at Wilson's Cottage, Pocock's-fields, Islington. I know the cottage in which the deceased lived. I have known the prisoner about twelve months; he has lodged at my house several times, and he came to lodge there seven nights before this occurrence took place. I remember the 16th of March; and at that time, from circumstances that occurred, I am confident that he had no money. On that day the prisoner went out between eight and nine o'clock without having any breakfast. He had on a pair of shoes which I sold him, and they had nails in them. The prisoner wore them constantly. He returned home about three o'clock

in the morning, and he immediately went into his room. My wife said to him, 'Richard, is it early, or late?' and he replied, 'It is early.' The prisoner got up between eight and nine o'clock the next morning, and came into my sitting room, and passed through into the washhouse, which leads to the privy. He stayed out from five and twenty minutes to half an hour when he returned into the house and went out at the front door. I did not observe anything unusual in his appearance. The prisoner returned home about seven o'clock in the evening, and in the meantime I had heard of the murder of Mr. Templeman, and I told him of it. The prisoner said it was a shocking thing, and he asked me if I considered Mr. Templeman could have done it himself. I said, 'Richard, how can a man bind his own hands and eyes?' The prisoner then appeared agitated, and said his inside was out of order, and he went into the yard, and remained for a few minutes. . . . I asked him where he had been so late on the night before. He said he had been at the Rainbow, and had stopped there until twelve o'clock at night, and when he came out he met some friends, who detained him. Before this time I had a piece of wood in my possession, which was about a foot and a half long. The prisoner went to bed about nine o'clock, and I bolted him in and gave information to the police. He accounted to me for the possession of the money by saying that it had been given to him by his relations."

Mrs. Allen's evidence was to the same effect; but she proved in addition, that a stocking in which the money was found concealed belonged to the prisoner.

The evidence otherwise was of a very general description, and although many expressions of a very suspicious character were attributed to the prisoner by the witnesses, none of them amounted to an admission by him of his guilt. The jury, after

having received the customary charge from the learned Judge, returned a verdict of acquittal. . . .

But on the next day, he was surprised at finding that he had again got into the custody of the police, a warrant having been executed upon him, in which he was charged with being a party to the robbery which had been committed in the house of Mr. Templeman, on the night of the murder.

He was carried to London loudly complaining of the breach of good faith on the part of Sergeant Otway, and on being conveyed to Bow-street, he repeatedly expressed his willingness to disclose all he knew upon his being liberated. This condition, however, was refused to be acceded to, and in the hope of obtaining the reward, on the 11th of May he made a statement [confessing to the murder]. . . .

He had already been acquitted

of the murder, and it was impossible that he should be tried upon any fresh indictment upon that charge; but it still remained open to the friends of the deceased to prefer against him a charge of burglary, subjecting him to a penalty of transportation for life. Upon this latter charge he was indicted at the session of the Central Criminal Court, on the 22d of June, and the same evidence which had been before adduced having been again brought forward, together with proof of those additional facts admitted in his own confession, he was found "Guilty."

Mr. Baron PARKE, in addressing the prisoner, declared that there could be no possible doubt that he had been guilty of the murder of the unhappy deceased, and that he was justly brought to punishment. He sentenced him to be transported for life.

124. JONATHAN BRADFORD'S CASE. [Printed *ante*, as No. 57.]

125. THE GREAT OYER OF POISONING. (C. AINSWORTH MITCHELL. *Science and the Criminal*. 1911. p. 176.)

In the series of trials of the murder of Sir Thomas Overbury, in 1615, in the Tower of London (to which reference has already been made), the prisoners included Anne Turner, Richard Weston, Franklyn, Sir Thomas Elwes (the Lieutenant of the Tower), and the Countess of Somerset. It was alleged that the Countess of Somerset resented the interference of Sir Thomas Overbury, then a prisoner in the Tower, in her matrimonial schemes, or as Franklyn put it in his evidence: The Countess had told him that Sir Thomas Overbury "would pry so far into their affairs that it would overthrow them all." Richard Weston, who had been an apothecary's man but had afterwards become under keeper to the Lieutenant of the Tower, was arraigned on the charge that "he did obtain at the Tower of London certain poison of

green and yellow color, called rosalgar (knowing the same to be deadly poison), and the same did feloniously and maliciously mingle and compound in a kind of broth which he did deliver to the said Sir T. Overbury with intent to kill and poison." He was also accused of giving on other occasions poisons called "white arsenic" and mercury sublimate, which he "put and mingled" in tarts and jellies. . . . Anne Turner, who was tried as one of the accomplices, was the widow of a physician, and a friend of the Countess. She pleaded "Not guilty" to the charge.

The evidence as to sorcery used by her has already been mentioned, but the chief witness against her was James Franklyn, who made the following confession: "Mrs. Turner came to me from the Countess and wished me from her to get the

strongest poison I could for Sir T. Overbury. Accordingly I bought seven, viz.: Aqua fortis, white arsenic, mercury, powder of diamonds, lapis costitus, great spiders, and cantharides. All these were given to Sir T. Overbury, and the Lieutenant knew of these poisons. Sir T. Overbury never had salt but there was white arsenic put into it. Once he desired pig, and Mrs. Turner put into it lapis costitus. At another time he had two partridges sent him from the Court, and water and onions being the sauce, Mrs. Turner put in cantharides instead of pepper, so that there was scarce anything that he did eat, but there was some poison mixed. For these poisons the Countess sent me reward. She afterwards wrote unto me to buy her more poisons." It is obvious from this confession that the poisons supplied had no power, and it would seem that Franklyn was making income for himself by supplying harmless preparations for the poisons for which he was being paid. As far as it is possible to judge by reading the evidence, there was proof that attempts had been made to poison Sir Thomas Overbury, but no proof that any poison was ever given to him. However, the evidence appears to have been quite sufficient to convict the prisoners. . . .

After the execution of Mrs. Turner and Weston came the trial of Franklyn, who confessed that poison had not been the cause of Overbury's death. Weldon, who, in 1755, pub-

lished a history of the Kings of England, describes how Franklyn and Weston "came into Overbury's chamber and found him in infinite torment with the contention between the state of nature and working of the poison, and it had been very like that nature had got the better in that contention . . . but they, fearing it might come to light by the judgment of physicians that foul play had been offered him, consented to stifle him with bedclothes, which accordingly was performed. And so ended his miserable life, with the assurance of the conspirators that he died of poison, none thinking otherwise but these two murtherers." The account given by Weldon of the manner in which the Lord Chief Justice received this confession is well worth quoting. . . . "Then was Franklyn arraigned, who confessed that Overbury was smothered to death, not poisoned to death, though he had poison given him. Here was Coke glad to cast about to bring both ends together, Mrs. Turner and Weston being already hanged for killing Overbury by poison. But he being the very quintessence of the law, presently informed the jury that if a man be done to death with pistol, poniard, sword, halter, poison, etc., so he be done to death, the indictment holds good, if but indicted for one of those ways. But the good lawyers of those times were not of that opinion, but did believe that Mrs. Turner was directly murdered by Lord Coke's law, as Overbury was, without any law."

127. WILLIAM HABRON'S CASE. (N. W. SIBLEY. *Criminal Appeal and Evidence*. 1908. p. 293.)

William Habron, convicted at Manchester Autumn Assize, in 1876, before LINDLEY, J. (now Lord Lindley), for the murder of Police Constable Cock. It may be remembered that the fact which cast a

doubt upon the propriety of his conviction was the confession of Peace, in February, 1879, when lying under sentence of death for the murder of Mr. Dyson, at Banner-cross. This led to a free pardon

and £1000 compensation being granted to Habron. . . . It is common ground that the conviction of Habron took place purely on circumstantial evidence, and it was considered, at least at the time, that the case was perhaps the most remarkable case on record of circumstantial evidence. The facts as set forth in the *Times* in 1879 — it was not reported in 1876 — are as follows :

There were three brothers, Frank, John, and William Habron, living together at Chorlton, a village three miles from Manchester, in the employment of Mr. Deakin, a nursery gardener. In July, 1876, summonses were taken out against John and William Habron for disorderly conduct and drunkenness by Police Constable Cock. After the summonses were served the Habrons were heard to say that if the "Bobby" caused them any trouble, they would shoot him. At the hearing of the summons, Police Constable Cock, immediately on leaving the witness box, went to Mr. Bent, his superior officer, and a superintendent, and stated that William Habron had said to him, "If you get me fined, I will shoot you before the morning." This was on August 1st. The case against John Habron was dismissed, but William Habron was fined. The policeman was evidently laboring under some apprehensions; but Mr. Bent, knowing that coarse and vulgar threats were common enough among people of the condition of life of the Habrons, took no notice of it at the moment; but towards the evening, on reflection, he thought there might be something in it, and he intended next day to have given orders for the men on that beat to go in couples. Here a very singular and undoubted fact has become known; Cock had to go on duty that night at nine o'clock, and, as evening came on, he fell into a state of extraordinary depression, and told his landlady (he being a single man living at lodgings, having

joined the police only a few months before) that he was sure something would happen to him that night. With a great effort he, however, conquered his depression and went on his usual beat. He was on duty at Whalley Range, a district composed entirely of mansions and villa residences, and a few minutes before twelve o'clock he and Beauland, another constable, were together at West Point, near the residence of a gentleman named Gratrix. There they saw two men, one of whom was leaning against a post. A third man whom they did not know, and whom Peace claims to be, passed them. They did not know him. The officers knew all the three Habrons, and therefore this third man could not have been one of them. Beauland looked at this third man as he passed and asked Cock who he was. Cock said he did not know. Beauland then said he would follow him, and he went towards Mr. Gratrix's house, towards which he had seen the man disappear, and examined the place, but could see no traces of the man. He thought from the sudden disappearance that it was young Mr. Gratrix coming home. He turned back, and as he was turning he saw a flash and heard a report, and almost instantaneously it was followed by another flash and a report. The officer described them as following each other just as quickly as one could pull the trigger of a revolver. He heard Cock scream, "My God! I am shot," and ran up to him and found him lying on the footpath. He asked what was the matter, but Cock could make no reply, as he lay writhing on the ground.

Beauland heard a man exclaim, "Here is another policeman!" and then he heard footsteps running away. He whistled for assistance, and some carters and their carts came up, together with a young gentleman named Simpson, who had been talking with the two

officers only a minute or two before and heard the report of the two shots. Cock expired an hour afterwards from a wound in the breast, having been unable to make any statement. Information was at once given to Superintendent Bent, whose house is about a mile away from the scene of the murder. Instantly remembering what Cock told him of the threat to shoot him, he took officers with him and surrounded the cottage of the Habrons, which is about a quarter of a mile from where Cock was shot. As the officers approached the cottage a light was seen in one of the windows, but when they knocked at the door the light was extinguished. The police broke into the cottage and found the three brothers in bed. Mr. Bent ordered them to get up and dress, and each to put on the clothes and boots he wore that night. When the dressing was completed, without one word having been said as to why the arrest was made, Mr. Bent said, "I charge each of you with the murder of Police Constable Cock." Two of the brothers made no reply, but Frank Habron said, "I was in bed at the time." They were taken to Old Trafford Police Station, and Mr. Bent then took a posse of constables and formed a cordon round the spot where the murder had been committed. When daylight appeared it disclosed a number of footmarks at the place, one of which was very peculiar. The boots of the Habrons were sent for, and it was found beyond a shadow of doubt that one of those footmarks must have been made by the boots of the prisoner William Habron. The bullet which had killed Cock was found to be an ordinary revolver bullet, and the police at once set out on a strict search for firearms, but they were never able to find any. Some percussion caps were found in the pockets of one of the brothers, but this was accounted for by Mr. Deakin, who

said that he had given the prisoner a waistcoat and they might have been in it when he had given it to him. It was stated in the course of the investigation, however, that William went to a gunsmith's in Oxford Street and inquired as to the price of revolver cartridges. A box was shown to him, but he hesitated about the price and went out, as he said, to see a person outside, who was supposed to be his brother, and he did not return. It was found afterwards that three bullets had been taken from the box, but here another mysterious circumstance arose — namely, that those bullets did not correspond in size with the one that killed the constable. On this and other evidence William and John, Frank having been dismissed by the magistrates, were committed for trial both before the coroner's jury and the justices.

The trial came on at Manchester Assizes before LINDLEY, J., and the main defense set up was that at the time the accused could not have been in Oxford Street, but were really working at Chorlton, several miles away. On cross-examination, however, the alibi failed utterly as regards the prisoner William Habron, and after a long trial he was convicted and sentenced to death. Much dissatisfaction was expressed with the verdict, and a large number of people signed a petition for a reprieve. . . .

Peace's confession [that he was the real murderer] was received with considerable incredulity in February three years afterwards, and it seems to have been even believed that it was merely made with a view to obtain a respite [from his sentence of death for another murder]. The most serious criticism of his confession was undoubtedly the remarkable fact that if he had run away from the scene of the murder in the direction he represented in his confession, he must have run into the arms of Beauland,

Cock's fellow constable. The former, however, stated he saw nobody immediately after he heard the shots. A pistol has recently been found, thirty-one years after the crime, thrown into a pit on the scene of the Whalley Range murder, but in a direction opposite to that in which Peace declared he fled. . . . The sequence of events after the con-

fession of Peace was that Mr. Cross, then Home Secretary, stated in the House of Commons that he had felt it his duty to advise the Crown to grant a free pardon to William Habron, and that in this course he had entire concurrence of both the learned judge who tried the case and also of the law officers of the Crown. . . .

128. MADELEINE SMITH'S CASE. (W. WILLS. *Circumstantial Evidence*. Amer. ed. 1905. p. 300.)¹

In a case of the deepest interest, in 1857, before the High Court of Justiciary at Edinburgh, a question whether or not the prisoner had the opportunity of administering arsenic to the deceased was the turning point of the case. The prisoner, a young girl of nineteen, was tried upon an indictment charging her, in accordance with the law of Scotland, with the administration to the same person of arsenic, with intent to murder, on two several occasions in the month of February, and with his murder by the same means on the 22d of March following. She had returned home from a boarding school in 1853, and in the following year formed a clandestine connection with a foreigner of inferior position, named L'Angelier, whose addresses had been forbidden by her parents. Early in 1856 their intercourse assumed an unlawful character, as was shown by her letters. In the month of December following, another suitor appeared, whose addresses were accepted by her with the consent of her parents, and arrangements were made for their marriage in June. During the earlier part of this engagement, the prisoner kept up her interviews and correspondence with L'Angelier; but the correspondence gradually became cooler, and she expressed to him her determination to break off the connection, and implored him to return her letters; but this he refused to do, and declared that

she should marry no other person while he lived. After the failure of her efforts to obtain the return of her letters, she resumed in her correspondence her former tone of passionate affection, assuring him that she would marry him and no one else, and denying that there was any truth in the rumors of her connection with another. She appointed a meeting on the night of the 19th of February, at her father's house, where she was in the habit of receiving his visits, after the family had retired to rest, telling him that she wished to have back her "cool letters," apparently with the intention of inducing him to believe that she remained constant in her attachment to him. In the middle of the night after that interview, at which he had taken coffee prepared by the prisoner, L'Angelier was seized with alarming illness, the symptoms of which were similar to those of poisoning by arsenic. There was no evidence that the prisoner possessed arsenic at that time, but on the 21st she purchased a large quantity, professedly for the purpose of poisoning rats, an excuse for which there was no pretense. On the night of the 22d, L'Angelier again visited the prisoner, and about eleven o'clock on the following day was seized with the same alarming symptoms as before; and on this occasion also he had taken cocoa from the hands of the prisoner. After this attack L'An-

¹ [For a citation of the full report of this trial, see Appendix.]

gelier continued extremely ill, and was advised to go from home for the recovery of his health.

On the 6th of March the prisoner a second time bought arsenic; and on the same day she went with her family to the Bridge of Allan (where she was visited by her accepted lover), and remained till the 17th, when they returned to Glasgow. On the day before her departure for the Bridge of Allan L'Angelier wrote a letter to her. To this letter, the prisoner replied from the Bridge of Allan, that . . . she would answer all his questions when they met, and informed him of her expected return to Glasgow on the 17th of March. L'Angelier, pursuant to medical advice, on the 10th of March went to Edinburgh, leaving directions for the transmission of his letters, and having become much better, left that place on the 19th for the Bridge of Allan. . . .

A letter from the prisoner to L'Angelier came to his lodgings on Saturday the 21st, from the date and contents of which it appeared that she had written a letter appointing to see him on the 19th; he had not, however, received it in time to enable him to keep her appointment. In that letter she urged him to come to see her, and added, "I waited and waited for you, but you came not. I shall wait again to-morrow night, same time and arrangement." This letter was immediately transmitted to L'Angelier, and in consequence he returned to his lodgings at Glasgow about eight o'clock on the evening of Sunday the 22d, in high spirits and improved health, having traveled a considerable distance by railway, and walked fifteen miles. He left his lodgings about nine o'clock, and was seen going leisurely in the direction of the prisoner's house, and about twenty minutes past nine he called at the house of an acquaintance who lived about four or five minutes' walk from the prisoner's residence. After leaving his

friend's house, all trace of him was lost, until two o'clock in the morning, when he was found at the door of his lodgings, unable to open the latch, doubled up and speechless from pain and exhaustion, and about eleven o'clock the same morning he died, from the effects of arsenic, of which an enormous quantity was found in his body.

The prisoner stated in her declaration that she had been in the habit of using arsenic as a cosmetic, and denied that she had seen the deceased on that eventful night; whether she had done so or not was the all-momentous question. . . .

As to the principal charge of murder, his Lordship said, "Supposing you are quite satisfied that the prisoner's letter brought L'Angelier again into Glasgow, are you in a situation to say, with satisfaction to your consciences, as an inevitable and just result from this, that the prisoner and deceased met that night? — that is the point in the case. It is for you to say whether it has been proved that L'Angelier was in the house that night. . . .

"If you think they met together that night, and he was seized and taken ill, and died of arsenic, the symptoms beginning shortly after the time he left her, it will be for you to say whether in that case there is any doubt as to whose hand administered the poison. . . .

"And I say there is no doubt — but it is a matter for you to consider — that after writing this letter he might expect she would wait another night, and therefore it was very natural that he should go to see her that Sunday night.

"But this is an inference only. . . . In drawing an inference, you must always look to the important character of the inference which you are asked to draw. If this had been an appointment about business, and you found that a man came to Glasgow for the purpose of seeing another upon business, and that he

went out for that purpose, having no other object in coming to Glasgow, you would probably scout the notion of the person whom he had gone to meet, saying, 'I never saw or heard of him that day'; but here you are asked to draw the inference that they met upon that night, where the fact of their meeting is the foundation of a charge of murder. You must feel, therefore, that the drawing of an inference in the ordinary matters of civil business, or in the actual intercourse of mutual friends, is one thing, and the inference from the fact that he came to Glasgow, that they did meet, and that, therefore, the poison was administered to him by her at that time, is another, and a most enormous jump in the category of inferences. Now, the question for you to put to yourselves is this — Can you now, with satisfaction to your own minds, come to the conclusion that they did meet on that occasion, the result being, and the object of coming to that conclusion being, to fix upon her the administration of the arsenic by which he died? . . . You may be perfectly satisfied that L'Angelier did not commit suicide; and of course it is necessary for you to be satisfied of that before you could find that anybody administered arsenic to him. Probably none of you will think for a moment that he went out that

night and that, without seeing her, and without knowing what she wanted to see him about, he swallowed about 200 grains of arsenic in the street, and that he was carrying it about with him. Probably you will discard such an idea altogether, . . . yet, on the other hand, keep in view that that will not of itself establish that the prisoner administered the poison. . . .

"Therefore if you cannot say, We find here satisfactory evidence of this meeting, and that the poison must have been administered by her at a meeting — whatever may be your suspicion, however heavy the weight and load of suspicion is against her, and however you may have to struggle to get rid of it, you perform the best and bounden duty as a jury to separate suspicion from truth, and to proceed upon nothing that you do not find established in evidence against her."

The jury returned, in conformity with the law of Scotland, a verdict of not guilty on the first, and of not proven on the second and third charges. On the supposition that the parties met on the fatal evening in question, there could be but one conclusion as to the guilt of the prisoner, the hypothesis of suicide being considered by the learned Judge as out of the question, as it obviously was.

129. O'BANNON *v.* VIGUS. [Printed *post*, as No. 383.]

Topic 4. Habit (Usage, Custom)

130. JAMES SULLY. *The Human Mind*. (1892. Vol. II, p. 224.) Habit is a product of acquisition. In this respect it differs from instinct, with which otherwise it has much in common. We say we do a thing from habit, *e.g.* nod back when a person not recognized nods to us, when as a consequence of long practice and frequent repetition the action has become in a measure organized, and thus shorn of some of its original appanage of full consciousness or attention. The characteristic note of habit is mechanicality. In its most forcible manifestation habitual movement approaches to a sub-conscious reflex, as in the case just referred to. . . . It is thus evident

that in habit we have in a particular way to do with that lapse of the intenser degrees of consciousness which accompanies an approximation of nervous structures to a state of perfect adjustment to the environment. The oft-repeated action becomes habitual and so automatic because the nervous centers engaged have taken on special modifications, have, according to the customary physiological figure, become "seamed" by special lines of discharge. The perfect fixation of a habit appears to liberate the highest cortical centers from all but the slightest measure of coöperation in the process, the greater part of the central work (transmission of a definite kind of afferent excitation into a definite path of motor discharge) being now carried out by help of stably fixed arrangements in subordinate centers. . . . The on-coming of habit is shown by two principal criteria. First of all, repetition of movement tends to remove all sense of effort and to render the movement easy. . . . In the second place, habit involves and manifests itself in a consolidation of the processes of association involved. One of the most familiar characteristics of habit is prompt succession of a movement on the recurrence of the idea of a desired object. Here the intermediate idea of the movement itself is repressed or skipped. . . . A further and more striking result of this fixing of associative connection is the coördination of particular sense presentations with appropriate motor-responses. This is illustrated in the recurring movements of everyday life, as taking out a latchkey on approaching one's door. Where this process is complete there lapses not only the initiative idea of the movement, but even the idea of procurable object. Thus when a man automatically winds up his watch on taking it out of his pocket during the operation of dressing for dinner, the action seems to be wanting in all ideational initiation. . . .

Habit and Chains of Movement. As we saw when dealing with the process of association, series of movements tend by repetition to grow consolidated, so that each step calls up the succeeding ones without a distinct intervention of consciousness. Simple examples of this are to be found in the series of movements involved in walking, dressing, and undressing, in playing a piece of music from memory, reciting a familiar poem, and so forth. Such chains of movement approximate in their lack of clear consciousness, their mechanical regularity, and promptness of succession to the motor sequences in breathing, and other primarily automatic movements. . . . What differentiates such habitual chains from primarily automatic successions is the initial volitional impulse. I must consciously and voluntarily start the walking, the dressing, and so forth. But the start is all, so far as volition is concerned. The succession then takes care of itself, and, what is more, is carried out better for the non-intervention of attention. . . .

Degrees of Habitual Coördination. It follows from our general definition of the principle, that habit shows itself in very unlike degrees of strength. The process of organic attachment is more or less complete in the case of different movements. We may now glance at these differences in the strength of habit, and seek to determine their conditions. We may estimate the prompting force of habit in more ways than one. The obvious index to its influence is lapse of physical initiation as seen in the swiftness of the motor response. All the popular examples of habit, as the story of the victimized soldier who dropped his dinner at the word "Attention!"

shouted by some practical jokers, illustrate this feature. The swifter the response to a particular sense stimulus, the more of force of habit is there indicated. Another criterion is specialty or precision of response. . . . The soldier's loss of his dinner was due to the unerring precision of the habitual reaction, the swift dropping of the arms into the vertical line on the recurrence of the customary signal. The stronger the habit, the more definite or exact will be the response. Another measure of strength of habit closely connected with the preceding is uniformity, or unfailingness of response whenever the proper stimulus occurs. This criterion, together with speciality or definiteness, gives to habit its unvarying and monotonous character, its resemblance to the actions of a machine, and to those lower nervous reflexes which come nearest to mechanical actions. Lastly, the strength of a habit is directly measurable in terms of the difficulty of modifying it by special volitional effort. Half-formed habits can be easily altered; wholly formed, only by dint of extraordinary volitional effort. Employing such criteria, we can draw up a scale of habitual movement. . . . The main conditions on which these varying degrees of habit depend appear to be the following: (1) The amount of time and attention given to the particular movement or combination of movements so as to make it our own. Since habit is superinduced on a volitional process, it is evident that the action must first be perfectly acquired through a conscious process of acquisition. (2) The frequency with which the particular stimulus has been followed by the particular movement. This condition, repetition, or frequency of performance, is the great determinate of strength of habit. (3) The unbroken uniformity of past responses. By this is meant that a particular stimulus *S* should have always been followed by a particular motor reaction *M*, not sometimes followed, at other times not, or followed by another sort of movement, as *M'*. This condition evidently goes to determine the degree of unfailingness, as also of specialization in the habit. Thus, children who are sometimes required to do a certain thing by their parents, but now and again allowed to intermit the action, never acquire perfect habits.

131. HANS GROSS. *Criminal Psychology*. (1911. transl. Kallen, § 28, p. 158.) We have yet to ask what is meant by "rule" and what its relation is to probability. Scientifically "rule" means law subjectively taken, and is of equal significance with the guiding line for one's own conduct, whence it follows that there are only rules of art and morality, but no rules of nature. Usage does not imply this interpretation. We say that as a rule it hails only in the daytime; by way of exception, in the night also; the rule for the appearance of whales indicates that they live in the Arctic Ocean; a general rule indicates that bodies that are especially soluble in water should dissolve more easily in warm than in cold water, but salt dissolves equally well in both. Again we say: As a rule the murderer is an unpunished criminal; it is a rule that the brawler is no thief and *vice versa*; the gambler is as a rule a man of parts, etc. We may say, therefore, that regularity is equivalent to customary recurrence and that whatever serves as rule may be expected as probable. If, *i.e.* it be said, that this or that happens as a rule, we may *suppose* that it will repeat itself this time. It is not permissible to expect more. But it frequently happens that we mistake rules

permitting exceptions for natural laws permitting none. This occurs frequently when we have lost ourselves in the regular occurrences for which we are ourselves responsible and suppose that because things have been seen a dozen times they must always appear in the same way. It happens especially often when we have heard some phenomenon described in other sciences as frequent and regular and then consider it to be a law of nature. In the latter case we have probably not heard the whole story, nor heard general validity assigned to it. Or, again, the whole matter has long since altered. . . . This, therefore, should warn against too much confidence in things that are called "rules." False usage and comfortable dependence upon a rule have very frequently led us too far.

132. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹ Of the probative value of a person's habit or custom, as showing the doing on a specific occasion of the act which is the subject of the habit or custom, there can be no doubt. Every day's experience and reasoning make it clear enough.

There is, however, much room for difference of opinion in concrete cases, owing chiefly to the indefiniteness of the notion of habit or custom. If we conceive it as involving an invariable regularity of action, there can be no doubt that this fixed sequence of acts tends strongly to show the occurrence of a given instance. But in the ordinary affairs of life a habit or custom seldom has such an invariable regularity. Hence, it is easy to see why in a given instance something that may be loosely called habit or custom should receive little weight, because it may not in fact have sufficient regularity to make it probable that it would be carried out in every instance or in most instances. Whether or not such sufficient regularity exists must depend largely on the circumstances of each case.

In civil cases, a habit or custom or usage is of particularly frequent use evidentially. Whether it involves the conduct of an individual or of a specific group of persons, or of an indefinite and anonymous group of persons, the principle is the same. But the larger and more indefinite the group, the less likely is it to discover such regularity as gives great probative value to the course of conduct. The less the regularity, the greater the number of hypotheses which (on the principle of Explanation) can be availed of to weaken the inference.

In occasional aspects, habit is the real basis of the inference when resort is had to general experience of human nature without adducing express proof of the habit, *e.g.* if a man is seen going from the train station to his office without a hat, we infer that he had possessed it when entering the train, because of the known custom of persons in general to wear a hat in going to work; thus, our final inference that he lost it on the way, either by theft in the train or by putting his head out of the window, follows a preliminary inference based on habit or custom.

133. TWICHELL'S CASE. (FRANCIS. L. WELLMAN. *The Art of Cross-examination*. 1908. p. 146.)

A very striking instance of the effect of *habit* on the memory, especially in relation to events happening in moments of intense ex-

¹[Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, §§ 92-99, in part.)]

citement, was afforded by the trial of a man by the name of Twichell, who was justly convicted in Philadelphia some years ago, although by erroneous testimony. In order to obtain possession of some of his wife's property which she always wore concealed in her clothing, Twichell, in great need of funds, murdered his wife by hitting her on the head with a slung shot. He then took her body to the yard of the house in which they were living, bent a poker, and covered it with his wife's blood, so that it would be accepted as the instrument that inflicted the blow, and having *unbolted the gate* leading to the street, left it ajar, and went to bed. In the morning, when the servant arose, she stumbled over the dead body of her mistress, and in great terror she rushed through the gate, into the street, and summoned the police. The servant had always been *in the habit* of unbolting this gate the first thing each morning,

and she swore on the trial that she had done the same thing upon the morning of the murder. There was no other way the house could have been entered from without excepting through this gate. The servant's testimony was, therefore, conclusive that the murder had been committed by some one from *within* the house, and Twichell was the only other person in the house. After the conviction Twichell confessed his guilt to his lawyer, and explained to him how careful he had been to pull back the bolt and leave the gate ajar for the very purpose of diverting suspicion from himself. The servant in her excitement had failed either to notice that the bolt was drawn or that the gate was open, and in recalling the circumstance later she had allowed her usual daily *experience* and *habit* of pulling back the bolt to become incorporated into her recollection of this particular morning. It was this piece of fallacious testimony that really convicted the prisoner.

134. HETHERINGTON v. KEMP. (1815. Nisi Prius. 4 Campb. 192.)

This was an action on a bill of exchange; and the only question was, whether the defendant had received notice of its dishonor. The plaintiff proved, that on the 14th of November, the day after it came due, he wrote a letter addressed to the defendant, stating that it had been dishonored; that this letter was put down on a table, where, according to the usage of his countinghouse, letters for the post were always deposited; and that a porter carries them from thence to the post office. But the porter was not called, and there was no evidence as to what had become of the letter after it was put down upon the table. A notice to produce the letter had been served upon the defendant.

Taddy, for the plaintiff, contended that this was good *prima facie* evidence that the letter had been sent by the post.

Lord ELLENBOROUGH.—You must go farther. Some evidence must be given that the letter was taken from the table in the countingroom, and put into the post office. Had you called the porter, and he had said that although he had no recollection of the letter in question, he invariably carried to the post office all the letters found upon the table, this might have done; but I cannot hold this general evidence of the course of business in the plaintiff's countinghouse to be sufficient.

A letter was then put in from the defendant, in which he acknowledges the receipt of a letter from the plaintiff of the 14th of November, without referring to its contents; and Lord ELLENBOROUGH said he would presume this was the letter to inform him of the dishonor of the bill.

The plaintiff had a verdict.

135. AMERICAN EXPRESS CO. v. HAGGARD. (1865. ILLINOIS SUPREME COURT. 37 Ill. 466.) . . .

Appeal from the Circuit Court of McLean County; the Hon. JOHN M. SCOTT, Judge, presiding. David D. Haggard brought this action on the case in the court below, against the American Express Company, to recover for a package of money sent to the plaintiff at Bloomington, Illinois, by his agent, from Clinton, in De Witt county. . .

The plaintiff having proved the delivery of the package to the company, introduced W. Haggard, who testified as follows: "In July, 1863, I was in the employment of the plaintiff, at Bloomington, as clerk. The package of money spoken of by the last witness was never delivered to me. I went to the office of the defendant, in Bloomington, about a week after it was sent, with the plaintiff, and there saw a receipt for said package which I had signed. The receipt was in the book in which the express company took receipts, and was in my handwriting. I did not at first remember anything about it. After reflecting, and seeing the receipt, I then recollected of Jacob Shook, the driver who delivered packages for the express company, coming to the store of the plaintiff, and of my signing the receipt. I did not get the package at the time I signed the receipt. I supposed that it was for a package of castings and was left on the sidewalk. The plaintiff is a hardware merchant, and sells reapers, and other agricultural machinery. I was in the habit of signing for packages of castings often, sometimes two or three times a day, and had receipted for money, and had authority to do so. After it was discovered that the package was lost, I wrote to my father in Chicago about it, stating the facts, and he paid the plaintiff (who is my uncle) the amount of the loss, and charged it to me. I did not request my father to pay it. I was then under

twenty-one years of age, and am still so." . . . Being cross-examined, the witness further testified: "When Shook, the driver, came to the store, I gave him the receipt now shown to me. I think some customers were in the store at the time. Plaintiff was not in the store. I think the receipt book was on the show case when I signed the receipt. Shook stood by the counter. I saw no package, nor did he call my attention to any package. Shook was in the habit of laying packages of castings on the sidewalk and coming in and getting a receipt. If Shook had laid it down on the counter, it might have been taken up by somebody else. I did not look for any package then, nor at any time afterwards. I did not think of it again until I was told that it was lost and that I had receipted for it. I did not then recollect anything at all about it. After two or three days, when I saw the receipt, I recollected that I had given to Shook a receipt, as I have stated." The plaintiff here rested his case.

The defendant then called as a witness, L. W. Fuller, who testified: "I have been in the employ of the defendants about eight years, as agent having charge of offices. The business of drivers is to deliver packages, and collect the charges, and get receipts for packages. He is not allowed to deliver without getting a receipt, and always takes the package to the consignee, when he calls for the receipt." Being cross-examined, this witness testified that Jacob Shook, formerly driver for defendants, stole property that had been brought by express; he took part out of packages that came in bad order, and delivered the balance; he was discharged by the defendants; before he was discharged, he was arrested, and gave up about \$850, and some valuable jewelry to the defendants. This

was not equal to the amount he had stolen. "I do not know that this claim of the plaintiff was included in the claim against Shook; I do not recollect about that. I think I spoke to the detective who had Shook in custody about this claim of plaintiff, and may have stated the amount to him; also about one claimed to have been lost by Mr. Hyde, together with other losses. The detective got all the money and jewelry that was got from Shook, and delivered the same to me. The detective turned Shook over to an officer of the law from whom he escaped and fled from justice." The defendant objected to the testimony called out on cross-examination, which objection was overruled by the Court, and the defendant excepted. The Court found the issue for the plaintiff, and rendered judgment accordingly. The defendants thereupon took this appeal. . . .

Mr. *R. E. Williams*, for the appellants. Mr. *W. H. Hanna*, for the appellee.

Mr. Justice LAWRENCE delivered the opinion of the Court: This was an action on the case brought by the appellee, David D. Haggard, against the American Express Company, for not delivering a package of money containing \$170.30, sent to the appellee at Bloomington, Illinois. . . . The admission of the testimony of W. Haggard is also assigned for error. It appears that the witness was a clerk in the hardware store of the plaintiff, who was his uncle; that he was in the habit of often receipting to the company for goods, sometimes two or three times a day, and that he receipted for the package in question, supposing, as he swears, that he was receipting

for castings that had been left on the sidewalk. He swears he never received the money in question. After its loss was discovered, with the fact that the witness had given the company a receipt for it, he wrote to his father in Chicago, stating the circumstances, and thereupon his father paid to the plaintiff the amount of his loss. . . . It is also urged that the evidence of Fuller called out on the cross-examination was improperly received. Fuller was the agent of the company, and was put upon the stand by them to prove the custom of the drivers of the express wagons, in regard to the delivery of parcels and taking of receipts. The plaintiff, on the cross-examination, proved that it was the custom of the particular driver who had this package to steal money parcels, and that some time after this occurrence the company arrested him, made him surrender \$850 in money and some valuable jewelry, and that the driver escaped from the officer and ran away. We think, after the examination in chief, this evidence was admissible. . . . Here the clerk swears there was no delivery, that he neither saw nor heard of a package of money, and thought he was receipting for a package of castings on the sidewalk. The company is a common carrier and must be held to the strictest responsibility for the honesty of its agents, and if one of them abstract a parcel while in the act of delivering it, the company will be liable even though a receipt be signed and the form of delivery gone through, by the driver's laying the property, for a moment, out of his hands. We find no error in the record. Judgment affirmed.

136. DENVER & RIO GRANDE RAILWAY CO. v. GLASSCOTT.
(1878. COLORADO SUPREME COURT. 4 Colo. 270.)

Error to County Court of Arapahoe. The case is stated in the opinion.

Messrs. *Wells, Smith & Macon*, for

plaintiff in error. Messrs. *Patterson & Campbell*, for defendant in error.

THATCHER, C. J. — Robert A. Glasscott was a conductor of the

defendant company. He brought suit against the company for the balance claimed to be due him for services as conductor rendered to the company, laying his damages at five hundred dollars, for which sum a verdict was returned and judgment entered in the court below. Unless the defendant was entitled to an offset, no dispute arises as to the correctness of the judgment. The company by its pleas and proof offered to offset against the claim of the conductor, the sum of fifteen hundred dollars, which it is alleged that he, as conductor, had collected from passengers traveling on his train, and retained and converted to his own use. To support the allegations of conversion and the amount of the same, plaintiff in error called R. F. Weitbrec, its treasurer, and proved by him that defendant in error had been conductor of passenger trains of plaintiff in error, running between Denver and El Moro, during eleven months next preceding May 1, 1877; that it was the duty of defendant in error as such conductor, to collect fare of all passengers on his trains not provided with tickets; that a round trip of a train run by defendant in error was from Denver to El Moro and back to Denver, a distance of 220 miles each way; that at the conclusion of every such round trip, defendant in error was required to report to the auditor and treasurer of plaintiff in error the number of passengers carried each way, the points on the route to which and from which they were transported, with the number and kind of tickets on which they traveled, the number without tickets, and the amount of money collected from such passengers, which money it was his duty to turn over to the treasurer at the end of each round trip; that he, the witness, had in court every one of such reports made by defendant in error during said eleven months; that plaintiff in error had another conductor, named Cole Lydon, who

conducted trains of plaintiff in error on alternate days with defendant in error; that Lydon made same number of trips as defendant in error in said eleven months; that said Lydon's trains generally, although not always, contained same number of cars as that of defendant in error; that number of cars was liable to be increased or diminished as necessities of travel required; the schedule of fares was the same; that he, witness, also had all of Lydon's reports for said eleven months, and that they were the same as those made by defendant in error, but differed in the amount of money shown to have been received during said eleven months.

The only controversy in this case arises as to the manner in which the company proposed to prove that Glasscott was in default. The theory of the company seems to be that upon the above statement of facts, Glasscott should be held liable for the difference between Lydon's receipts and the amount he, Glasscott, paid to the treasurer. With a view to fix his liability and the amount thereof, the attorney of the company interrogated the witness as to the difference between the receipts of the two conductors. This evidence, and other evidence belonging to the same class, the court excluded. All other evidence offered was admitted. Our only inquiry, therefore, is: Did the court err in excluding the evidence mentioned? The learned counsel insist that had it been made to appear that there was a difference in favor of Lydon between the total sums paid to the treasurer by the two conductors, "if the jury had found for the plaintiff in error, upon that circumstance alone, the court would not have been justified in setting the verdict aside." This proposition is, we think, untenable. The possibility that there might be an exact equality in the receipts of the two conductors is so remote, and subject to so many disturbing

influences, that we cannot believe that it can justly be considered as the foundation of legal liability. One conductor may be more attentive to the patrons of the road, and therefore more popular than another. The current of travel may be very unequal on two successive days, and this may continue for weeks. Excursion trains, crowded with passengers, may have been run on certain days, which might materially increase the receipts on such days. On one day every passenger getting on board at Denver might be provided with a ticket, and the receipts at this point in consequence be nothing. The next day one or a dozen passengers may have boarded the train and have forgotten to buy tickets. The same thing is liable all along the line, so that even if the number of passengers carried by each conductor during the period of eleven months, or any shorter period, should be the same, it is by no means, in our judgment, a fair inference that the receipts will be the same, or approximately so.

Counsel treats us with a metaphysical disquisition on the "Doctrine of Chances" and the "Theory of Probabilities," and even indulge in algebraic equations for the purpose of demonstrating the remoteness of the possibility that the receipts of the two conductors would be the same. We have not thought it necessary to solve the algebraic problem with a view to determine the chance of equality of receipts. It is true that "cæteris paribus" the position that an equal number of persons would forget to buy their ticket each day before entering the cars is not unsupported by metaphysical writers. Says Mr. Henry Thomas Buckle, in his work on the *History of Civilization in England* (Vol. I, p. 32): "We are now able to prove that even the aberration of memory are marked by a general character of necessary and invariable order. The post offices of London and of Paris have latterly published

returns of the number of letters which the writers through forgetfulness omitted to direct: and making allowance for the difference of circumstances, the returns are year after year copies of each other. Year after year the same proportion of letter writers forget this simple act; so that for each successive period we can actually foretell the number of persons whose memory will fail them in regard to this trifling, and as it might appear, accidental occurrence." Whether or not forgetfulness is under unvarying laws, certain it is, in our opinion, that in addition to forgetfulness, there is such a complication of causes tending to vary the receipts of the two conductors, that it would be unsafe, as well as unwarranted, to adopt the rule for which plaintiff in error contends. We can find no support for it in the adjudicated cases.

For eleven months Glasscott had been the trusted agent of the company. With regularity at the close of every round trip he accounted to the company for the alleged amount of his receipts. Of his own accord, without the slightest suspicion as to his fidelity having been expressed against him, he quit the company's service. The fact of the difference between the receipts of the two conductors, had it been proved, would have been far from establishing the matter in dispute, viz. that the difference had in fact been collected and embezzled by Glasscott. It is so remote a circumstance that, had the rejected evidence been received, the jury would not have been warranted in rendering a different verdict. The verdict, had the excluded evidence been admitted, not only might, but must, under the law, have been the same. In such case the rule is that the verdict should not be disturbed. *City Bank of Brooklyn v. Dearborn*, 20 N. Y. 246; *Starbird v. Barrows*, 43 id. 200. The judgment of the Court below will be affirmed with costs. Affirmed.

TITLE IV (continued): EVIDENCE TO PROVE THE DOING OF A HUMAN ACT

SUBTITLE C: RETROSPECTANT CIRCUMSTANCES

138. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹
There remains the third group of circumstantial evidence, namely, facts having a Retrospectant indication. The inference here looks backward from the evidentiary fact to the alleged act; *i.e.* taking our stand at the fact offered, we infer from it that at some previous time the act was or was not done. The common feature of this group of evidentiary facts is that they are all open to a similar source of weakness, and thus offer to the opponent a general mode of explaining away their force. Thus, if, to show that A on January 1 stole a bicycle, there is offered the fact of his possession of the bicycle on June 1, the probative force of this fact rests on the assumption that the hypothesis that will explain his possession is that he obtained the bicycle by stealing it. But there are also in truth other possible hypotheses, for example, that it was given or sold to him by the thief or by a purchaser from the thief, or that he found it. So, if in proving the doing of an act by A as a mark of his identity with B, there is offered (as in the Tichborne case) the fact that A has a recollection of the event, or if, to disprove it, we offer the fact that A has no recollection of it, the opponent may show, in the first instance, that the recollection has come, not from having done the act, but from having heard or read about it; and, in the second instance, that the lack of recollection is due, not to not having done the act, but to the natural fading of memory. In short, the tests of relevancy and the opportunities of explanation are of the same general nature in this group of evidentiary facts. The general argument runs: Is the trace one whose possession (or lack of possession) by the person charged could be explained by the operation of other causes than the doing (or not doing) of the act in question?

The kinds of facts may best be roughly subdivided according to the mode in which such causes might operate, *i.e.* according as the connection between the evidentiary trace and the act in question is Mechanical (Physical) or Mental. The typical case of the first sort is the possession of stolen goods; of the second sort, consciousness of guilt.

Topic 1. Mechanical (Physical) Traces

139. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)²
(1) *General Principle*. The presence upon the person or premises of articles, fragments, stains, tools, or any other resulting circumstance, is constantly

¹[Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, § 148.)]

²[Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, §§ 149-160, in part.)]

employed as the basis of an inference that the person did an act with which these circumstances are associated.

In criminal cases the use of this inference is typical. But it is no less applicable in several sorts of civil cases, where its nature is not always so obvious.

(1) (a) When an animal is found in B's possession, and the animal bears a brand or other mark, and one of the issues is whether A is the owner of the animal, it is a natural and immediate inference that the animal belongs to the person whose brand it bears, and, if that brand is A's, then to A. This inference, however, while sufficiently probable in the light of practical experience, is in truth a composite one, made up of two steps: (1) first, the inference, from the presence of A's usual mark, that A placed this particular mark, — a genuine argument under the present principle, from a trace to the source of the trace; and (2) secondly, the inference from the fact that A placed it there, to the fact of his ownership of the animal. The latter step of inference is the vital one; it is perhaps not less natural than the former, but it is more serious in its effect. It would seem that the latter step of inference has been rarely conceded by Courts, as a matter of common law; though the former step was universally conceded, it was said that the presence of A's brand was evidence of identity (*i.e.* of the animal being one of those originally branded by A), but not of ownership. This unduly cautious attitude has been generally corrected by legislation; in most of the stock-raising communities, the *brand on animals* is made evidence of ownership; though in order to encourage registration and thus prevent confusion, the rule is applied only to brands duly registered by law. (b) The postmark on an envelope is, upon the same principle, admissible to show that the envelope bearing it had passed through the hands of the postal officials at the time and place indicated. (c) The payee of money naturally leaves behind him in the hands of the payor some document by way of receipt or evidence of payment; where this document is the instrument of obligation itself, its possession by the debtor is evidence of the discharge of the debt. (d) The existence of a document in a certain kind of place — such as the grantee's custody or office of registry — may be sufficient evidence of the delivery of the document, so far as its delivery may be material. (e) The existence of a document of ownership of land (a deed, lease, or license) may be evidence that the maker of the document had possession of the land at the time of making it. This doctrine, now well settled in English law, is applicable in proof of title by adverse possession in prior generations, where no evidence has survived except the documents themselves which embodied acts of claim of ownership. (f) Finally the reverse of the preceding inference (4) may be made; *i.e.* from the present possession of land the inference that there once existed a deed of it, now lost, may be made:

This is the logical foundation of the presumption of a lost grant, which after long service has finally degenerated into a mere rule of substantive law, although the living principle of the original inference is still occasionally open to application.

(2) *Negative Traces.* If certain results would have followed if an act or an event had occurred (or not occurred), the absence of those results is some indication that the act or event has not occurred (or occurred). (a) A

common class of evidence of this sort is that of lack of news to show probable death of a person or the probable loss of a ship; for as it is usual for living persons to be heard from directly or indirectly, by persons having an interest in knowing, and for ships' officers to leave word of their journey at the ports they touch or with the other ships they pass, the lack of any such news indicates their non-existence. In counterexplanation (*ante*, No. 2) such facts as the infrequency of communication from the place the person went to, the fixed determination of the person to give up all connection with his former home, and the like, may of course be used to explain away the force of the fact of lack of news.

(b) It is a natural propensity of creditors to realize their claims, when left unsatisfied, by process of law, within a fair space of time; and when it is found, after some time, that a creditor has not resorted to law for the realization of his claim, there is a natural inference that this failure was due to the lack of right and necessity to resort to law, *i.e.* that the claim had been satisfied by payment. The fact may be explained away by showing a more probable hypothesis, for example, the insolvency of the debtor, his absence, or other circumstance likely to prevent the creditor from proceeding even though the claim was unpaid. (c) In various other situations a retrospectant inference is permissible from the absence of certain results to the absence of certain causes; the chief of these are the inference, from the non-discovery of a will once existing, to the testator's revocatory destruction of it; the inference from the non-discovery of any document and the lapse of time, to the loss of the document; and the inference, from a debtor's continued possession of property, after its mortgage or sale, of his fraudulent intent to defraud creditors by the transfer. In general, that a certain effect was not seen or heard by those who would naturally have seen or heard it had its cause occurred is some evidence of the non-occurrence. But, though this situation can thus be treated as permitting an inference from circumstantial evidence, it is usually more natural to treat it as involving testimonial evidence; *i.e.* the argument is that witness A is qualified to testify that act X was not done by B, because A would have seen or heard it if it had been done; thus, the principle of testimonial knowledge is here the controlling one.

2. *Traces and Identity.* The question may be asked, What is the distinction between evidence of *traces* and evidence of *identity*? For example, to prove a murder, evidence is offered that a gun found in the defendant's possession is exactly fitted by the bullet found in the body of the deceased; what kind of evidence is this? The truth is that this evidentiary fact is double, and involves both kinds of inferences. The nature of the argument to prove Identity (*ante*, No. 14) is that a certain fact offered is an essential mark of sameness of person, — in this instance, that the fit of the bullet is a necessary and unique mark of the slayer. The weakness of this type of argument is that the mark may not be necessarily associated with one person but may be common to a number of persons; and hence the mode of explaining away such evidence is to show that other persons also have the same mark, — here, that other persons in the neighborhood possessed guns of the same bore. Now the argument from Traces assumes that the argument to Identity has been settled and accepted, *i.e.* here it assumes that the use of the gun in question is an essential or sufficient

mark of the murderer, and it then sets about to prove that the accused possessed that mark, *i.e.* used that gun; and to do this it offers the fact of its subsequent finding in the accused's possession. Here the weakness of the argument is an entirely new and different one, namely, the trace of subsequent possession does not necessarily indicate a use at the time of the murder, since the gun may be one which the accused has recently borrowed, or it may be his own gun which was lent to another person at the time of the murder. Thus, there are two wholly different evidentiary questions involved in the use of this evidence, — first, the question of identity, whether this individual gun is a necessary mark of the slayer; and, secondly, the question of traces, whether its subsequent possession evidences its use at the time of the murder. The present type of argument, then, — the argument from traces to a former act, — is a distinct argument from that of Identity.

3. *Organic Traces.* In this sort of Traces may be included those which are in strictness biologic or organic rather than mechanical. They play an important and well-recognized part in a few classes of cases. (a) When a child X is born to a wife A married to a husband B, it is natural to infer that the intercourse which begot the child was the intercourse of the husband B, *i.e.* that the child is *legitimate*. It is true that this inference is less strong where the birth occurs very shortly after the marriage; but even here the likelihood that the premarital intercourse was B's is greater than that it was another man's. This inference is the foundation of the presumption of legitimacy. (b) If the *corporal traits of the progenitor* are or may be transmitted to the progeny, then a specific corporal trait of the progeny may point back to a person of similar trait as the progenitor, on the condition that the person so charged as progenitor is within the number of those who by association and opportunity may have had intercourse (for otherwise the possible number of similar persons would leave open too many hypotheses). The propriety of the inference rests on the supposed physiological likelihood that traits may be transmitted by procreation. (c) A physiological principle, similar to the preceding one, but attended usually with more clearly marked results, tells us that the progeny of persons of one *race* receive from the progenitors certain corporal traits very different from the traits transmitted from a progenitor of another race. The presence of these peculiar traits of the race are therefore evidential to show a progenitor of the race bearing those traits. (d) That a shock received by the mother during *pregnancy* may leave a mark upon the child has long been a popular belief. Should it ever receive scientific sanction in any defined terms, the child's corporal mark after birth may be taken as evidential of the act which produced it. (e) That the existence of *venereal disease* in a husband is some evidence of an act of adultery on his part has always been conceded; it is merely a question of the strength of the explanatory circumstances. (f) Here also may be classed the evidence furnished by an *animal's conduct* in recognition of a physical fact. *E.g.* the trained bloodhound, after smelling a garment, may follow and point to a particular person; the strength of the inference depends on experience as to the trustworthiness of the animal's senses. Or, a dog or a bird may by conduct indicate recognition of a person said to be his owner; here the inference arises from experience as to the impressions made by familiarity with an owner and as to the certainty of interpretation of the conduct showing recognition.

140. ALEXANDER M. BURRILL. *A Treatise on Circumstantial Evidence*. (1868. pp. 275, 539.) I. Traces, marks, or indications on the person or premises of the accused, derived or supposed to be derived from the scene or subject of the crime, embrace the following appearances and objects.

1. *Wounds* or marks of violence of a *peculiar* kind; that is, inflicted by the assaulted person in self-defense, or in the course of resistance, either with a particular instrument, or in a particular manner: as where, in a case of robbery, the prosecutor, when attacked, struck the robber on the face with a key; and a mark of a key, with corresponding wards, was visible on the face of the prisoner: or where the person assaulted made several cuts at the robber with a clasp knife, and corresponding cuts were found in the clothing and on the person of the accused.

2. *Stains* of particular substances, *visible* on the clothing. These often serve to indicate the presence of the accused at the scene of crime, to trace his movements there, and to trace him from it, as effectually as footprints of a peculiar kind. Thus, in the case of *Rex v. Richardson*, the stockings of the accused, which had been hidden by him, were found to be soiled with mud, which, on examination, appeared to correspond precisely with the soil of a bog or puddle adjoining the cottage where the murder was committed, and which was of a very particular kind, none other of the same kind being found in that neighborhood. . . .

3. *Objects* found on the person or premises of the accused, and shown to have been taken from the scene or subject of the crime; such as a watch, keys, and similar small articles.

4. The *fruits* of the crime; such as money, or papers found in the prisoner's possession, and shown to have belonged to the person upon whom the crime has been committed. . . . Such possession may also sometimes be *inferred* from observed circumstances, as by a sudden and material *change in life* or circumstances, indicating, beyond question, the recent receipt of money or property from some quarter; where a person, previously known to be poor, is found, shortly after a robbery, larceny, or murder, in the possession of considerable wealth, it is always a circumstance of suspicion.

5. The *subject* of the crime itself, discovered on the premises of the accused; such as the body of the murdered person found buried under his house, or dismembered and concealed in a box or other private depository.

In the two species of facts last mentioned, we arrive at the most convincing physical materials that can possibly be made use of in evidence, to connect a person accused with a crime committed.

II. The *exculpatory* considerations applicable to these facts, are brought forward in the shape of *possible causes* or *reasons assigned* for their existence; and these also seem to be divisible into three kinds: accident, innocent conduct of the accused, and conduct of the real criminal or some third person. The following exhibit the principal instances of their application.

1. *Criminative objects or articles found in possession*. First. The fact of the possession of a *stolen article*, or an article alleged to have been stolen, admits of the following suppositions, as its possible causes:

It may have been conveyed to the place where it was found, by some irresponsible agency, such as the act of a child, or even of an animal. It may have been honestly found by its possessor. It may have been purchased, borrowed, or received as a gift or deposit, from the thief himself, in

ignorance of his character: or it may have been purchased, borrowed, or received from a person who purchased or received it from the thief. It may have been taken from the owner, while in a state of intoxication, with the view of keeping it for him, and returning it on his becoming sober. It may have been taken from a person suspected of having stolen it, and kept with the view of seeking out the true owner, or bringing the thief to justice. It may have been deposited with the possessor, without his knowledge or consciousness, by the thief himself, in order to avert suspicion from himself, or from a malicious design to injure the possessor. It may have been deposited with the possessor, by the owner himself (it not being a case of theft at all) from a similar malicious motive. . . .

Secondly. The fact of the possession of a *criminative article*, such as the instrument with which a crime has been committed, or an article known to have belonged to the subject of the crime, or the subject of the crime itself, — may admit of similar suppositions, that is to say :

It may have been thrown away or dropped by the real criminal, and innocently picked up by the possessor; there being nothing in its mere appearance indicative of its criminal use. It may have been purchased, or borrowed, or received as a gift or deposit, from the real criminal, in ignorance of the character both of the article and the person. It may have been deposited on the premises of the possessor, without his knowledge, by the criminal himself, in order to get rid of it or conceal it. It may have been deposited on such premises, or even attached to the person of the possessor, without his knowledge, by the criminal, from a malicious design to criminate the other. It may have been deposited on the premises of the possessor, by a third person, equally innocent as himself, with the mere view of getting rid of it, and escaping its supposed or known criminative effect.¹

2. *Criminative appearances on the person.* First. Appearances of *blood* on the person or clothing admit of the following suppositions, in the way of explanation: It may not be blood at all, but a stain produced by a liquid or substance of similar color. But supposing it ascertained to be blood, It may have been occasioned by an accidental bleeding from the nose, etc., or a wound on the person. It may have been occasioned by unconscious contact with another person having a bleeding wound. It may have been occasioned by having come in contact with a bleeding body in the dark. It may have been produced by a surgical operation, as by the party's having been recently bled, or having recently bled himself. It may not be human blood, but that of an *animal*, transferred to the person on the occasion of his having slaughtered it, in the way of his calling, or otherwise; or in consequence of his having handled it in any way, or come in contact with it or within reach of blood issuing from it.

Secondly. *Marks*, as of cuts, scratches, wounds, or bruises on the face or person, may have been produced by a fall, or the kick or scratch of an animal, or contact with sharp substances of various kinds.

141. **THE BAKER'S CASE.** (T. DUNPHY and T. J. CUMMINS. *Remarkable Trials of All Countries.* 1873. p. 453.)

A Maltese judge of the 1700 s, named Cambro, who was an early riser, having left his bed one morning before sunrise, hearing the footsteps of people running violently in the street, was led by curiosity to see what occasioned it at that unusual hour. Most of the houses in Valletta are furnished with balconies, covered and glazed, which when provided with curtains, permit the inhabitants, if inclined, to observe what is going on in the street, without being themselves discovered. The judge, from one of these, though it was not yet daylight, perceived a man running in great terror from another, who followed close behind. Directly under the judge's window the pursuer overtook the flyer, and stabbed him; the wounded man reeled and fell; in the act of striking, it is to be remarked, the assassin's cap came off, so that the judge had an opportunity of viewing his features in the increasing daylight; hastily recovering it he instantly took to flight. A few paces further on, he threw away the sheath of his stiletto and turned into another street; the judge consequently lost sight of him.

Scarcely had he witnessed this extraordinary spectacle, than a baker, with his basket of bread for the daily consumption of his customers, made his appearance. As he walked leisurely along, the sheath of the stiletto, which lay in his path, caught his eye; he stooped, took it up, and, after examining it a little, put it in his pocket and continued his course. Just then a patrol of police, either by accident or drawn by the noise which had attracted the attention of the judge, entered the same street. In the meantime, the baker, a little lower, came to the body just assassinated; the police took the same direction, and the poor man at this instant

perceived them behind him; terrified at the sight of the corpse, and fearful of being suspected and arrested, he lost all presence of mind, and hid himself in the entrance of a gentleman's house near the spot. . . . It was not long before they detected the unfortunate baker in his hiding place; his incoherent and confused replies created suspicion; on searching him they found the sheath on his person; the stiletto had fallen from the wound, and lay near the body; on applying it to the sheath, they found it corresponded exactly, and less than all these circumstances would have warranted the arrest of the poor baker. He was accordingly carried to prison, and public report gave out that he was undoubtedly the murderer.

Nor was this prepossession any way contradicted or removed by the judge, who, though he had witnessed the whole occurrence, kept it a profound secret in his own breast. Official report was made to him within an hour after the event — still he communicated the fact to no one. The only way of accounting for his extraordinary conduct is, that he presided in the criminal court, and that there was a doubt in the existing jurisprudence, how far a judge ought to act from his own private knowledge of a case, and whether he ought not altogether to limit himself to the disposition of witnesses and other evidence brought forward on the trial, without any reference to information he might have casually received from other sources. The dull and heavy intellect of Cambro, unable to distinguish between the rule and the exception, embraced this opinion.

The unhappy baker was, in due time, brought to trial. Circumstances were certainly against him; the stupid judge, who knew his innocence, particularly listened to,

and punctually noted, all the apparent proofs of his guilt. . . . The hapless wretch was condemned to death, and horrible to relate, soon after underwent the sentence of the law.

It was not long before the dreadful truth was brought to light: the

real murderer, arrested, brought to trial, and condemned to death. . . .

The grand master not only degraded and dismissed Cambro from all his employments, but obliged him to provide handsomely, from his private fortune, for the family of this victim of judicial murder.

142. THE CASE OF THE SAILMAKER'S APPRENTICE.
(S. M. PHILLIPPS. *Famous Cases of Circumstantial Evidence.* No. XL.)

In the year 1723, a young man who was serving his apprenticeship in London to a master sailmaker, got leave to visit his mother, to spend the Christmas holidays. She lived a few miles beyond Deal, in Kent. He walked the journey, and on his arrival at Deal, in the evening, being much fatigued, and also troubled with a bowel complaint, he applied to the landlady of a public house, who was acquainted with his mother, for a night's lodging. Her house was full, and every bed occupied; but she told him, that if he would sleep with her uncle, who had lately come ashore, and was boatswain of an Indiaman, he should be welcome. He was glad to accept the offer, and after spending the evening with his new comrade, they retired to rest. In the middle of the night he was attacked with his complaint, and wakening his bedfellow, he asked him the way to the garden. The boatswain told him to go through the kitchen; but, as he would find it difficult to open the door into the yard, the latch being out of order, he desired him to take a knife out of his pocket, with which he could raise the latch. The young man did as he was directed, and after remaining near half an hour in the yard, he returned to his bed, but was much surprised to find his companion had risen and gone. Being impatient to visit his mother and friends, he also arose before day, and pursued his journey, and arrived home at noon.

The landlady, who had been told of his intention to depart early, was not surprised; but not seeing her uncle in the morning, she went to call him. She was dreadfully shocked to find the bed stained with blood, and every inquiry after her uncle was in vain. The alarm now became general, and on further examination, marks of blood were traced from the bedroom into the street, and at intervals, down to the edge of the pierhead. Rumor was immediately busy, and suspicion fell, of course, on the young man who slept with him, that he had committed the murder, and thrown the body over the pier into the sea. A warrant was issued against him, and he was taken that evening at his mother's house. On his being examined and searched, marks of blood were discovered on his shirt and trousers, and in his pocket were a knife and a remarkable silver coin, both of which the landlady swore positively were her uncle's property, and that she saw them in his possession on the evening he retired to rest with the young man. On these strong circumstances the unfortunate youth was found guilty. He related all the above circumstances in his defense; but as he could not account for the marks of blood on his person, unless that he got them when he returned to the bed, nor for the silver coin being in his possession, his story was not credited. The certainty of the boatswain's disappearance, and the blood at the pier, traced from his bedroom, were

two evident signs of his being murdered; and even the judge was so convinced of his guilt, that he ordered the execution to take place in three days. At the fatal tree the youth declared his innocence, and persisted in it with such affecting asseverations, that many pitied him, though none doubted the justness of his sentence.

The executioners of those days were not so expert at their trade as modern ones, nor were drops and platforms invented. The young man was very tall; his feet sometimes touched the ground, and some of his friends who surrounded the gallows contrived to give the body some support as it was suspended. After being cut down, those friends bore it speedily away in a coffin, and in the course of a few hours animation was restored, and the innocent saved. When he was able to move, his friends insisted on his quitting the country and never returning. He accordingly traveled by night to Portsmouth, where he entered on board a man-of-war, on the point of sailing for a distant part of the world; and as he changed his name, and disguised his person, his melancholy story never was discovered. After a few years of service, during which his exemplary conduct was the cause of his promotion through the lower grades, he was at last made a master's mate, and his ship being paid off in the West Indies, he, with a few more of the crew, were transferred to another man-of-war, which had just arrived short of hands from a different station. What were his

feelings of astonishment, and then of delight and ecstasy, when almost the first person he saw on board his new ship was the identical boatswain for whose murder he had been tried, condemned, and executed, five years before! Nor was the surprise of the old boatswain much less when he heard the story.

An explanation of all the mysterious circumstances then took place. It appeared the boatswain had been bled for a pain in his side by the barber, unknown to his niece, on the day of the young man's arrival at Deal; that when the young man awakened him, and retired to the yard, he found the bandage had come off his arm during the night, and that the blood was flowing afresh. Being alarmed, he rose to go to the barber, who lived across the street, but a press gang laid hold of him just as he left the public house. They hurried him to the pier, where their boat was waiting; a few minutes brought them on board a frigate, then underway for the East Indies, and he omitted ever writing home to account for his sudden disappearance. Thus were the chief circumstances explained by the two friends, thus strangely met. The silver coin being found in the possession of the young man, could only be explained by the conjecture, that when the boatswain gave him the knife in the dark, it is probable that as the coin was in the same pocket, it stuck between the blades of the knife, and in this manner became the strongest proof against him.

143. JOHN JENNINGS' CASE. (JAMES RAM. *On Facts as Subjects of Inquiry by a Jury*. 3d Amer. ed. 1873. p. 439.)

A gentleman, traveling to Hull, in the year 1742, was stopped late in the evening, about seven miles short of it, by a single highwayman, with a mask on, who robbed him of a purse containing twenty guineas. The highwayman rode off a different

road, full speed, and the gentleman pursued his journey. It, however, growing late, and he being already much affrighted at what had passed, he rode only two miles farther, and stopped at the Bell Inn, kept by James Brunell. He went into the

kitchen to give directions for his supper, where he related, to several persons present, his having been robbed; to which he added this peculiar circumstance, that when he traveled he always gave his gold a particular mark; that every guinea in the purse he was robbed of, was so particularly marked, and that, most probably, the robber, by that means, would be detected. Supper being ready, he retired. He had not long finished his supper, before Brunell came into the parlor. After the usual inquiries of landlords, "Sir," says he, "I understand that you have been robbed, not far from hence, this evening." — "I have, sir." — "And that your money was all marked?" — "It was." — "A circumstance has arisen which leads me to think that I can point out the robber." — "Indeed!" — "Pray, sir, what time in the evening was it?" — "It was just setting in to be dark." — "The time confirms my suspicions!" Brunell then informed the gentleman that he had a waiter, one John Jennings, who had, of late, been so very full of money, at times, and so very extravagant, that he had had many words with him about it, and had determined to part with him on account of his conduct being so very suspicious; that, long before dark, that day, he had sent him out to change a guinea for him, and that he had only come back since he (the gentleman) was in the house, saying, he could not get change; and that Jennings being in liquor, he had sent him to bed, resolving to discharge him in the morning. That, at the time he returned him the guinea, he (Brunell) did not think it was the same which he had given him to get silver for, having perceived a mark upon this, which he was very clear was not upon the other; but that, nevertheless, he should have thought no more of the matter, as Jennings had so frequently gold of his own in his pocket, had he not afterwards heard (for he was not

present when the gentleman was in his kitchen relating it) the particulars of the robbery, and that the guineas which the highwayman had taken, were all marked; that, however, a few minutes previously to his having heard this, he had unluckily paid away the guinea which Jennings returned him, to a man who lived some distance off, and was gone; but the circumstance of it struck him so very strongly, that he could not, as an honest man, refrain from giving this information.

Brunell was thanked for his attention. There was the strongest reason for suspecting Jennings; and if, on searching him, any of the marked guineas should be found, as the gentleman could swear to them, there would then remain no doubt. It was now agreed to go softly up to his room: Jennings was fast asleep; his pockets were searched, and from one of them was drawn forth a purse, containing exactly nineteen guineas. Suspicion now became demonstration, for the gentleman declared them to be identically those of which he had been robbed! Assistance was called, Jennings was awaked, dragged out of bed, and charged with the robbery. He denied it firmly, but circumstances were too strong to gain him belief. He was secured that night, and the next day carried before a neighboring justice of the peace. The gentleman and Brunell deposed the facts on oath; and Jennings having no proofs, nothing but mere assertions of innocence to oppose them, which could not be credited, he was committed to take his trial at the next assizes.

So strong were the circumstances known to be against him, that several of his friends advised him to plead guilty on his trial, and to throw himself on the mercy of the court. This advice he rejected, and, when arraigned, pleaded not guilty. The prosecutor swore to

the being robbed; but that, it being nearly dark, the highwayman in a mask, and himself greatly terrified, he could not swear to the prisoner's person, though he thought him of much the same stature as the man who robbed him. To the purse and guineas, which were produced in court, he swore, — as to the purse, positively, — and as to the marked guineas, to the best of his belief, and that they were found in the prisoner's pocket.

The prisoner's master, Brunell, deposed to the fact of the sending of the prisoner to change a guinea, and of his having brought him back a marked one, in the room of the one he gave him unmarked. He also gave evidence as to the finding of the purse, and the nineteen marked guineas, in the prisoner's pocket. And, what consummated the proof, the man to whom Brunell paid the guinea, produced the same, and gave testimony to the having taken it, that night, in payment, of the prisoner's master. Brunell gave evidence of his having received of the prisoner that guinea, which he afterwards paid to this last witness. And the prosecutor comparing it with the other nineteen, found in the pocket of the prisoner, swore to its being, to the best of his belief, one of the twenty guineas of which he was robbed by the highwayman.

The judge, on summing up the evidence, remarked to the jury, on all the concurring circumstances against the prisoner; and the jury, on this strong circumstantial evidence, without going out of court, brought in the prisoner guilty.

Jennings was executed, some little time after, at Hull, repeatedly de-

claring his innocence to the very moment he was turned off.

Within a twelvemonth after, lo! Brunell, Jennings's master, was himself taken up for a robbery done on a guest in his own house; and, the fact being proved on his trial, he was convicted, and ordered for execution. The approach of death brought on repentance, and repentance confession. Brunell not only acknowledged the committing of many highway robberies, for some years past, but the very one for which poor Jennings suffered!

The account he gave was, that he arrived at home, some time before the gentleman got in who had been robbed. That he found a man at home waiting, to whom he owed a little bill, and that, not having quite enough loose money in his pocket, he took out of the purse one guinea, from the twenty he had just got possession of, to make up the sum; which he paid, and the man went his way. Presently came in the robbed gentleman, who, whilst Brunell was gone into the stables, and not knowing of his arrival, told his tale, as before related, in the kitchen. The gentleman had scarcely left the kitchen, before Brunell entered it; and being there informed, amongst other circumstances, of the marked guineas, he was thunderstruck! Having paid one of them away, and not daring to apply for it again, as the affair of the robbery and marked guineas would soon become publicly known, — detection, disgrace, and ruin appeared inevitable. Turning in his mind every way to escape, the thought of accusing and sacrificing poor Jennings at last struck him. The rest the reader knows.

144. COURVOISIER'S CASE. *and Evidence.* 1908. p. 191.) . . .

The facts shown in evidence at Courvoisier's trial were, that Lord William Russell, an old gentleman of the age of seventy-three, who

(N. W. SIBLEY. *Criminal Appeal*

lived by himself in Norfolk Street, with only two female servants and his valet, was found brutally murdered in his bedroom, his throat

being cut, and the bone at the back of the neck being cut through, at one desperate blow. The hypothesis of suicide was quite untenable; it was not only opposed to medical evidence, but no instrument was found, at or near the spot, by which suicide could have been committed. Suspicion early attached to Courvoisier, but it has always been recognized that the evidence was entirely circumstantial. TINDAL, C. J., in his charge to the jury, observed that "the case was one of circumstantial evidence. No eye saw the act committed."

The question really at issue, according to the summing up of the Chief Justice, was, whether the house was entered from without or whether the robbery was committed by some of the inmates, who also committed the murder. Was it a genuine robbery, or were valuable articles secreted in the pantry and scullery, and marks made on the back area door, with the view of diverting the attention of the officers of justice, so that the guilty party or parties might escape detection? The hypothesis of burglary derived some prima-facie support from the fact that the back area door was found open and certain marks were found on it, and also from the fact that there was a ladder in the yard that would have enabled the burglars to scale the wall of the area yard. The hypothesis of burglary was, however, negatived on what seems very conclusive evidence. Assuming it, it became also necessary to assume that the burglars deliberately selected a difficult mode of access and broke open a door which required considerable force to break through, when they had a much easier access through a glass door. There were also no marks on the walls or leads, over which, according to the hypothesis of burglary, the burglars must have passed. Yet these leads were covered with dust, which was undisturbed. Finally, the Chief Justice

asked: "Was it possible to believe, if thieves had entered the house for purposes of plunder, they would have made their exit, leaving so many small but valuable articles behind them, which might so easily have been disposed of about their persons?" The hypothesis of burglary and constructive murder seemed highly improbable; but when it was once dismissed, it became essential to conclude, that either Courvoisier, or the two female servants, must have murdered Lord William Russell. TINDAL, C. J., directed the jury that no one except the prisoner, the two female servants, and Lord William Russell were there that night in the house. The hypothesis that any one might have concealed themselves on the premises seems to have not been adverted to, as, presumably, there was not the slightest evidence of it.

The circumstantial evidence against Courvoisier comprised some five facts: (1) He had observed to the female servants, "I wish I had old Billy's money, I would not be long in this country." (2) His agitation and contradictory statements to the police. (3) The discovery of gloves and handkerchiefs in his own portmanteau slightly stained with blood. (4) The secreting of certain valuable articles, including a ten-pound note, all belonging to Lord Russell, in the scullery and pantry (no stranger, TINDAL, C. J., observed to the jury, could think of putting these articles where they were found). (5) About the date of the murder, Courvoisier called at a place of entertainment (also used as a hotel) in Leicester Square, where he had previously been employed as a waiter, under the name of John, and deposited a brown-paper parcel for safekeeping with a Mrs. Piolane, the wife of the master of the establishment. As Courvoisier was not known in the establishment in Leicester Square under his proper name, at the time the parcel

was left, he was not suspected. There seems a conflict of evidence whether the parcel was left before or after the murder. It may be assumed that it was left before, this being so, according to Mrs. Piolane's evidence, while her servant, who failed to identify Courvoisier, thought it had been left after the date of the murder. Some six weeks afterwards, during the first day of Courvoisier's trial, Mrs. Piolane was attracted by the suggestion in a paragraph in a French newspaper, in which the crime was discussed, to the effect that the articles taken from Lord William Russell's house, for which a reward of £50 had been offered, might have been deposited in some foreign hotel in London by Courvoisier. The parcel was opened with some ceremony in the presence of three persons, including a solicitor, and an inventory was taken. It was found to contain silver spoons and forks marked with Lord Russell's arms, two pairs of new stockings, a pair of gold auricles, a pair of dirty socks, and an old flannel waistcoat. A jacket and towel were wrapped round the things to prevent them rattling. Thomas Davis, formerly in the service of Mr. Webster, an optician, gave evidence at the trial of Courvoisier that he made a pair of gold auricles for Lord William Russell similar to those found in the parcel left by the prisoner at the hotel in Leicester Square. John Ellis, his lordship's former valet, recollected that Lord William Russell wore such "ear-instruments." Mr. Molteno, a print-seller in Pall Mall, identified the brown paper in which the spoons and forks were wrapped up as the covering of a print sent from his

shop, and he believed to Lord William Russell; he knew the brown paper was sent from his shop; his own stamped label was on it, and he was in the habit of selling prints to Lord William Russell. Finally, Lydia Banks, a washerwoman, identified the socks as Courvoisier's.

It may be doubted if a more dramatic moment was ever reached in a trial for murder than this discovery of Lord Russell's plate and the identification of Courvoisier as the mysterious bearer of the parcel to the depositary, Mrs. Piolane. The *Times* observed that "the fact of the plate having been discovered, and the identity of the prisoner proved, a communication to that effect was made to the prisoner, and on hearing a piece of intelligence so astounding and unexpected he turned deadly pale and became extremely agitated, and before the time arrived for his being again placed at the bar he sent for Mr. C. Phillips, his counsel, and disclosed his guilt to him." On the night of the fatal occurrence he was in the lower part of the house in the act of secreting the different valuable articles described at the trial in the scullery and pantry, where they were found by the police. Lord William Russell, being taken suddenly ill, came downstairs unexpectedly while he was so employed and caught him in the act and told him he would discharge him from his service. This roused him to a state of madness and he cut his throat with a carving knife. . . . It seems impossible to doubt that Courvoisier was a guilty man; his confession to his counsel on the second day appears to conclude the question.

145. **STARNE COAL CO. v. RYAN.** (1891. APPELLATE COURT OF ILLINOIS. 48 Ill. App. 216.) . . .

Opinion of the Court, the Hon. CARROLL C. BOGGS, Judge. The appellee, while in the employ of the appellant company as a driver

of coal cars on a track in its mine, was thrown from a car and injured. This is an appeal from a judgment in his favor because of such injuries.

The declaration contained three counts, the gravamen of the charge in each being that the appellant company negligently suffered a portion of the track of its road in the mine to become and remain in bad and unsafe repair and condition, and that by reason thereof the car upon which appellee was riding and driving left the track, causing the injuries complained of. . . .

The injury was received at a point where the track passed upon a somewhat descending grade through a rather dark entry. The appellee was driving a mule attached to a train of three cars, upon the front one of which he was riding. He came down the track at a rather rapid rate, the mule, according to the testimony, being in a "lope," when the car "jumped" the track and threw him against one of the props of the mine. He had been employed as a driver in this mine for some ten months and had been driving through the entry in which he was hurt for three weeks, during which time he passed and repassed frequently over the place where he was hurt, often passing there, as he testified, fifteen to twenty times per day. On the day that he was hurt he began work at 7.30 in the morning, passed the place in question seven times, and was passing it for the eighth time when the accident occurred. His testimony is that he observed nothing wrong with the track during any of the trips prior to the last one, and he thinks there was nothing wrong before that; that the car jumped the track because the end of one of the rails of the track was turned in at the joint; that it could not have been in that condition when he passed there on the preceding trips, nor when another driver passed down over it in advance of him or that driver would have been thrown off. . . . The appellee contends that the tie, upon which the rail rested and to which it ought to have been securely nailed, was defective and

insufficient to hold the nails or the rail, and for that reason the rail was moved from its place at the end where it should join with the next rail.

To support this contention and as the only evidence in its support, the appellee sought to show that, immediately after he was injured and before the cars from which he fell were moved, a new tie was placed in the track. From this, if true, it might reasonably be inferred that the track was unsafe with the ties already there, and that another tie was necessary to put the track in good and safe condition for use. Upon this point, in behalf of the appellee, J. R. Burns testified that he saw Michael Lynch, appellant's roadmaster, putting a tie in the track immediately in the rear of the car that left the track, before such car was moved after the accident; and Michael Laudregan, also a witness for the appellee, testified that he saw Lynch there at the time with a tie in his hands and that he seemed to be working at the track. This was all the testimony favorable to the appellee on this point.

Lynch testified that he went at once to the place of the accident, found two cars off the track, replaced them, examined the track and the iron rails carefully to see that they were safe for use, and found them in good condition; that he had a wooden gauge used for ascertaining whether the track is level, and that he and Michael Hickey, who was assisting him, placed this gauge upon the track to see that it was level; that he had no tie there; did not find it necessary to use one; and did not use one; that the rail was not bent nor turned in at the joint, but that the track was in good and safe condition for use, and they began at once and continued hauling cars over it after the accident as before. John Hickey, a coal miner, stated, as a witness, that he was with Lynch,

assisting in the work, and remained with him until the cars were running again over the track; that he examined the track and the rails, testing the rail carefully with a hammer; that there was nothing wrong with either; that he and Lynch gauged the track and found it level; that no tie was removed, nor was a tie put in the track; that it was not necessary to put one in. That the cars were hoisted on the track and the track at once used for the passage of cars as before. George Courdice, engineer of the mine, and Comack Cunningham, official state inspector of mines, officially examined the track at the place in question the next day after the appellee was injured. Both testified that the track and the rails were in good and safe condition; that they saw nothing to indicate that a tie had been placed in the track, and that if such had been done, indications of the work would have been found; that there were no such indications. Both join in the opinion that no tie had been placed in the track. The state inspector, with a lamp and hammer, examined carefully the rail and

spikes by which it was attached to the ties, and could find nothing indicating that any change whatever had been made in the track, the rail, or the ties.

We do not think that, under this evidence, the jury were warranted in finding that a tie was placed in the track, as claimed. Such a conclusion seems to us to be manifestly against the greater weight of the testimony. It would appear more reasonable to conclude that Burns, in the darkness prevailing in the entry, mistook for a tie the gauge which Lynch and Hickey were using, than to conclude that both Lynch and Hickey willfully and knowingly testified falsely, and that they did break the ground and place a tie in the track, in such manner as to leave no discernible trace of the work. If this view is correct, the evidence fails to show that the injury received by the appellee was occasioned by the failure of the appellant company to discharge its duty toward the appellee as its employee in the respect charged in the declaration. In the absence of such proof there can be no recovery.

146. **MOUDY v. SNIDER.** [Printed *post*, as No. 382.]

Topic 2. Mental Traces

147. JOHN H. WIGMORE. *Principles of Judicial Proof.* (1913.)¹
 (1) *General Principle.* The struggle of a victim for his life, and the act of taking his life, may leave upon the perpetrator indelible traces of blood, wounds, or rent clothing, which point back to the deed as done by him; these traces come from a mechanical contact with the body, weapons, and other things involved in the deed, and they remain upon him or are divested from him by a mechanical process. But a deed may also leave traces upon the doer through other than a mechanical process, *i.e.* through a mental, moral, or psychological process. These traces may be as significant in their way as the others, — perhaps more so; and they may be equally relevant evidentially to show their bearer to be the doer of the act. These traces, like those of the other sorts, may be employed either affirmatively or negatively;

¹[Adapted from the same author's *Treatise on Evidence.* (1905. Vol. I, §§ 172–177, in part.)]

the presence of such a trace may be used as indicating the doing of the act by the person bearing it; and the absence of the trace may be used as indicating the not doing it by the person not bearing the trace. The traces of this mental or psychological sort will be some form of a mental condition, — memory, belief, consciousness, knowledge, or whatever other name may be more usual and appropriate.

How to evidence this mental condition — by conduct or the like — is a second question. Here the inference is to a mental condition, usually from conduct as evidence. This falls under Title III, Human Condition, Subtitle C, Knowledge and Consciousness (*ante*, No. 30). This second sort of inference, in its present aspect, is seldom forced into obviousness. We are apt to infer, *e.g.* from an accused's flight to his guilt, forgetting that there are two steps of inferences, one from flight to a consciousness of guilt, and the other from consciousness to actual guilt of the past deed in issue. The cases usually present the evidence with the two inferences merged. In the study of the subject, they must be separately analyzed.

It is in criminal cases that the present class of inferences is most common. But in civil cases it may become equally valid; the following are some of the principal forms:

(2) *Civil Cases.* (a) *Legitimacy as evidenced by Parents' Conduct.* Upon an issue of the legitimacy of a child, the conduct of the parents towards the child is admissible on the present principle, as involving an inference from the parents' conduct to their belief as to the fact on which the legitimacy depends (time of birth, time of marriage, identity of the child, and the like), and then from that belief to the fact itself. Such evidence has traditionally been used since Solomon's day:

The Judgment of Solomon, (First Book of the Kings, III, 16), "Then came there two women, that were harlots, unto the king, and stood before him. And the one woman said, O my lord, I and this woman dwell in one house; and I was delivered of a child with her in the house. And it came to pass the third day after that I was delivered, that this woman was delivered also: and we were together; there was no stranger with us in the house, save we two in the house. And this woman's child died in the night, because she overlaid it. And she arose at midnight, and took my son from beside me, while thy handmaid slept, and laid it in her bosom, and laid her dead child in my bosom. And when I rose in the morning to give my child suck, behold, it was dead: but when I had considered it in the morning, behold, it was not my son, which I did bear. And the other woman said, Nay; but the living is my son, and the dead is thy son. And this said, No, but the dead is thy son, and this is my son. Thus they spake before the king. Then said the king, The one saith, This is my son that liveth, and thy son is the dead; and the other saith, Nay; but thy son is the dead, and my son is the living. And the king said, Bring me a sword. And they brought a sword before the king. And the king said, Divide the living child in two, and give half to the one, and half to the other. Then spake the woman whose the living child was unto the king, for her bowels yearned upon her son, and she said, O my lord, give her the living child, and in nowise slay it. But the other said, Let it be neither mine nor thine, but divide it. Then the king answered and said, Give her the living child, and in nowise slay it: she is the mother thereof. And all Israel heard of the judgment which the king had judged; and they feared the king: for they saw that the wisdom of God was in him, to do judgment."

(b) *Marriage, as evidenced by the Parties' Conduct.* A man and a woman cohabiting as husband and wife show by their conduct that they believe themselves to have made a contract of marriage, ceremonial or informal, at

some prior time. This is the commonest evidence of marriage. The conduct will vary in its significance; but the inference is obviously of the present sort.

(c) *Personality, as evidenced by Belief and Knowledge of Personal Doings, Family History, and the Like.* On an issue of personal identity, the present principle finds one of its simplest and commonest applications. The situation is this: Whether X is A is the fact in issue; A is shown to have done a certain act, to have had certain marked and individual experiences; if X did this act or had this experience, he probably is A; thus, as indicating whether X did or had it, the fact of his present belief or consciousness or recollection becomes relevant, and therefore his conduct as evidencing that belief. This sort of evidence, of the commonest use in the affairs of everyday life, has of course its weaknesses; the fact of X's belief or recollection of the act may be explained away as due, not to his having actually done the act, but to his having heard of it from others; while the fact of his non-recollection may also be explainable as due merely to that failure of memory which increases in proportion to the lapse of time and the insignificance of the act. Thus the strength of the inference is proportionate, on the one hand (when he claims to recollect), to the improbability of the person's having learned of the act from others, and, on the other hand (when he fails to recollect), to the improbability of a forgetfulness of the particular act. The theory of this sort of evidence, and its application, are well expounded in that marvelous feat of judicial skill and endurance, the charge of the presiding judge in the second Tichborne trial:

COCKBURN, C. J., in *R. v. CASTRO, alias ORTON, alias TICHBORNE*. (1874. Official Report of the Charge, I, 16; II, 327, 403.) [The claimant to the rich Tichborne estate purported to be Roger, the long-lost son, who had been given up for dead, after the news of his loss at sea, some twenty years before, in a vessel last heard of off the coast of South America; Roger had been brought up a Catholic, and attended a Catholic school at Stonyhurst, but had spent most of his youth in France, where he became more fluent in French than in English; he afterwards served awhile in the army; he was some twenty-five years of age when he left on his travels. The claimant had lived for most of his manhood life in the backwoods of Australia; and was said to be really Arthur Orton, a butcher of Wapping. At the civil trial for the title to the estates, in 1871, the claimant's case finally broke down and was not submitted to the jury; he was then, in 1874, put on trial for perjury and convicted; in this trial he was not competent as a witness, but his testimony at the civil trial was used against him; and it is in this cross-examination that most of the instances referred to by the Chief Justice were found. On the claimant's cross-examination by Sir J. Coleridge, it appeared that though Roger had been three years at Stonyhurst School and lived on the quadrangle, the claimant thought that the quadrangle was "a part of a building"; that, though Roger had studied Latin and Greek, the claimant replied, when asked, "Was Cæsar in verse or prose," "I don't recollect"; and "Was Cæsar a Latin writer or a Greek writer?" "I can't say; I suppose it was Greek"; and when shown a copy of Virgil, "It appears to me to be Greek"; and when asked, "Is mathematics the same thing as chemistry?" "I have no recollection"; and "Has Euclid anything to do with mathematics?" "I don't know"; and when asked, "What is physiology?" "The formation of the head, I believe"; and when asked the meaning of the Stonyhurst motto, "Laus Deo Semper," answered, "They mean, 'The laws of God forever.'" A list of Roger's library was read to him; he thought that the "Theatre de P. Corneille" was written "by one of the Fathers"; asked as to the "Life of John Bunyan," whether he was "a sportsman, a general, a bishop, a master of fox hounds, or a prize fighter," the claimant said it was "difficult to give an answer

to such a question." Taking up these instances, the Chief Justice commented as follows:]

"Although outward appearance may deceive, yet if you are acquainted with what has passed through the mind of a man, and another man were to come forward and say, 'I am that man,' you have only to ask him as to the events of the other man's life, those at least which must have remained impressed on his memory, and which, therefore, if he be the man, he must of necessity retain, to enable him to demonstrate that he is the man he says he is, or to enable you to pronounce that he is not. If his memory is not the memory of the man he seeks to personate, if he does not know the events of that man's life, if he does not know what thoughts, what feelings, what emotions, that man's mind underwent, he cannot be the individual. . . . Now you are in danger, in an inquiry of this nature, of being led into error by one of two alternatives. You may require too much; you may be satisfied with too little. You may require too much if you expect a man . . . to recollect every trifling individual occurrence of his life. . . . But there are things which it is next to impossible any one should forget, and in respect of those things we are entitled to require that a man should exhibit some knowledge when you know that they happened to a person whom he represents himself to be. . . . You must consider what it is you may fairly and reasonably and justly expect that a man should recollect. . . . Again, you may . . . also be satisfied with too little if you are led to accept, as true genuine knowledge, that which is not the honest production of the unaided memory, but knowledge derived from extraneous and adventitious sources. This is the danger into which persons too credulous have before now been led by imposture. . . . What, then, are the things which would have impressed themselves on the mind and memory of a boy growing up into the period of adult life? For the recollections of boyhood still cling to us in after years with the freshness of the age to which they belong, and, though less vivid, even those of childhood do not wholly disappear. . . . [After the recital of various instances, the cross-examination is then quoted]: 'Do you recollect [from your studies] whether Cæsar was written in verse or prose? No, I do not. — . . . Did you ever do any Cæsar? — I do not remember whether I did or not. — Is Cæsar a Latin writer or a Greek?' . . . To which comes the memorable answer, 'I should suppose *Cæsar is Greek.*' . . . Cæsar a Greek! Would Roger, do you think, have made that mistake? When Roger read Cæsar, did he believe he was reading Latin, or did he believe he was reading Greek? Is that a thing about which a person could make a mistake? Do you think that is what a man would be likely to forget?"

(d) *Contracts, Deeds, Appointments to Office, Etc.* The same mode of reasoning may, of course, upon occasion, be resorted to in evidencing the execution of a contract or the doing of any other important act. In its application to contracts and deeds, the principle is probably oftener applied than the number of recorded rulings indicates:

ERLE, J., in *R. v. FORDERINGBRIDGE*. (1858. E. B. & E. 678, 684; admitting conduct of master and apprentice to show the previous execution of an indenture of apprenticeship): "The execution here is whether upon this evidence a reasonable man would infer that the man had been bound apprentice. . . . The presumption of the existence of the deed [may be made] from the circumstances. . . . The relations of landlord and tenant, of partnership, of marriages, are frequently presumed from the conduct of the parties being consistent with that state of things, and more consistent with that than with any other."

148. ALEXANDER M. BURRILL. *A Treatise on Circumstantial Evidence*. (1868. pp. 420, 459, 465, 555, 567.) I. That the legal consequences of crime, — the loss of character, liberty, and life, attached to their commission, — are rarely contemplated in their true light beforehand, has been remarked under a former head. It is *after* the criminal act (especially if of a high grade) has been done, and when the author of it (if perchance touched with a feeling of penitence) finds that it cannot possibly be undone, and that his connection with the facts of the transaction is irrevocably fixed, that the impending consequences flash upon his mind with all their force. They are now not contemplated as ulterior and remote contingencies and possibilities, but seen close at hand, with no seducing or absorbing objects to intercept the view; and, thus seen, they have power to agitate the natures of most men thoroughly, and to occupy their thoughts exclusively. To avoid these consequences, by the concealment of either the crime, or the criminal, if not of both, is now a sort of natural impulse, which, observation shows, is almost universally obeyed. . . .

But even in cases where, apparently, the most effectual precautions for concealment have been taken, the *idea* of discovery may be said to haunt the mind, and the *fear* of discovery not unfrequently to agitate it, in spite of all determination to assume an exterior of calmness or indifference. Hence, where a case of suspected crime has become the subject of judicial investigation, . . . the idea — now converted into the prospect — of discovery, and that becoming a more and more probable event, as fact after fact is brought to light, naturally, and almost necessarily, fills the mind with alarm; particularly where the criminal finds his own person drawn within the sphere of the investigation.

Destruction, Suppression, and Eloignement of Evidence. Among the most common expedients resorted to for the purpose of hiding a crime are: the destruction or concealment of the subject of the crime itself; such as the concealment of a dead body, by interment, or otherwise; the removal of it to a distant spot, without burial; the mutilation or destruction of it, where concealment of the entire body is impracticable; concealment or destruction of the clothing of the body, or other articles upon it, by which the crime might be traced out; concealment or destruction of the instrument of the crime; removal of the physical marks and traces of the crime; concealment of the scene of the crime, and of the criminal himself, while engaged in such work of concealment or destruction; destruction of the scene, the subject and the evidence of the crime, by one single act of arson; concealment of the fruits of the crime; getting witnesses out of the way, and the like.

The presumption arising from any of these acts of destruction, suppression, or eloignement of evidence, where they have been fastened upon the accused by satisfactory proof, is always unfavorable. Assuming that an act of this kind was done with a motive, the logical inference is that it was done in order to get rid of something which would otherwise prejudice the actor. Hence, the conclusion is warranted, that the subject of action, if presented in evidence, would, in fact, operate against him. The principle of this presumption is a general one, applicable in civil as well as criminal cases; and is embodied in the well-known maxim, *Omnia præsumuntur contra spoliatorem*. It must be borne in mind, however, that the getting rid of evidence,

or of the sources, materials, or instruments of evidence by any of the methods which have just been considered, is not, in itself, and necessarily, incompatible with the innocence of the party who is proved to have resorted to such expedients, as will be more fully shown under a future head.

Fabrication or Forgery of Evidence. This fabrication is effected in two principal ways: first, *indirectly*, by intentionally producing on the senses of observers, impressions which shall, without fault on their part, lead to wrong ideas and conclusions, and thus, from the earliest stages, divert suspicion and inquiry to other objects and into other channels; or, in the event of actual discovery and consequent trial, aid, in the form of testimony, in disproving the criminal charge; secondly, *directly*, by prevailing upon individuals who, it is supposed or feared, may be called on for information or testimony, to misstate one or more of the facts of the case; or even to state, as facts, what they themselves know to be absolute falsehoods.

Conduct, Demeanor, and Language after the Commission of a Crime. The principal criminative circumstances usually classed under this head are, the alarm and confusion of a suspected person in prospect of his discovery; his concealment and flight; his agitation and other conduct on arrest; his silence under accusation; his giving false, evasive, or inconsistent replies to inquiries made of him; his unsatisfactory explanations of suspicious appearances; and his statements of a confessional character, whether judicial or otherwise.

II. *Infirmative Hypotheses.* (1) *Suppression of Criminative Objects.* The criminative article or appearance sought to be destroyed, suppressed, or eloiigned, may have been, in the first instance, *fabricated* by the real criminal, by placing it in the possession of the innocent party, or even annexing it to his person; and the removal of it may be prompted by the desire of avoiding the effect apprehended to follow from the possession of such an article or appearance. . . .

(2) *Fabrication or Forgery of Evidence.* An innocent person, finding a criminative article — such as a blood-stained garment or a bloody knife — upon his premises, and naturally (however injudiciously) desiring to rid himself of it, may carry his action farther than mere eloiignment or removal, by conveying the article upon the premises of a *neighbor*; thus actually fabricating evidence against the latter. . . .

(3) *Giving Different and Inconsistent Accounts of the Cause of the Death of a Person.* This fact may be explained, consistently with the innocence of the accused, on the supposition of the statements being merely *conjectural*, without any claim to the character of accurate information; or on the supposition of the information having been received from *various* persons, and at different times, or obtained from mere general report.

(4) *Objecting to the Examination of a Dead Body.* The objection, especially in the case of a near relationship to the deceased, may arise from a natural feeling of *repugnance* against having the body of a friend subjected to anatomical examination. . . .

(5) *Refusal to look at a Dead Body.* This circumstance, also, may be explained on the supposition of a natural feeling of *repugnance* (which cannot be pronounced uncommon in its occurrence) against looking at the body of a person who has come to a violent end; especially if in a bleeding, mangled, mutilated, or decaying state. . . .

(6) *Alarm in view of Discovery.* . . . A weak or ignorant person might be led to overrate the effect of circumstances, really immaterial, but seemingly tending to criminate him; and by the exhibition of needless alarm in consequence, actually create against himself evidence to strengthen the force of these very circumstances.

(7) *Concealment and Flight.* It may be one of those *ordinary* cases of simple change of residence in the same community or vicinity, or of departure from it, in pursuit of health, business, or pleasure, which are constantly occurring in all communities. . . . But, supposing it a case of actual *concealment* or *flight*, in the proper judicial sense, induced or impelled by a *fear of the power of the law*, it may have arisen from a source wholly unconnected with the *particular* crime charged; such as a desire to avoid the service of civil process, or the inquiry into some other offense. Finally, supposing that the observed act of departure or disappearance, on the part of a suspected person, was actually caused by a desire to avoid the charge of having committed the crime which has been discovered, even this circumstance, though proved ever so clearly, is, in itself, by no means conclusive evidence of guilt. Under certain circumstances, the most innocent person may deem a judicial trial too great a risk to encounter. . . .

(8) *Conduct and Language on Arrest; Fear as expressed by Deportment.* The force of these manifestations, as criminative circumstances, depends on the correctness of the inference that the particular symptom observed has been produced by the emotion of *fear*; that is, of fear of detection, or punishment for the offense charged. They may be considered as subject to the following infirmative considerations:

The appearance observed may not be the effect or manifestation of any *mental* emotion whatever, but of a purely *physical* fact; namely, bodily indisposition. The appearance may be the effect of mental emotion, but of a *different* emotion from that inferred; such as astonishment, anger, or grief. Supposing the appearance observed to be actually the effect of the emotion of *fear*; that emotion may be referable to other causes than a consciousness of *guilt*; thus, It may arise from a consciousness that appearances are against the party, and a consequent apprehension that he may be subjected to judicial annoyance and vexation, or possibly condemned as guilty, although innocent, . . . or, it may arise from an apprehension that a fact which has no criminal character whatever will be publicly exposed, to the injury, mortification, or vexation of the party himself, or some other individual connected with him by some tie of sympathy.

Supposing, finally, that the appearance observed is not only, in truth, the effect of the emotion of *fear*, but that such emotion arises from a consciousness of *guilt*, . . . it may be a consciousness of some *other crime*, committed either by himself, or by some other individual connected with him, and on whom the inquiry may bring down suspicion or punishment.

Confusion manifested on being charged with participation in the commission of a crime, or questioned as to some circumstance connected or supposed to be connected with it may arise from a feeling of mortification at the discovery of a fact supposed to have been known only to the party himself. The apparently strongly criminative fact of *resisting a search* of the person may arise from a similar feeling. A story related by Mr. *Bentham*, as one which he had often heard or read of, may be repeated in his own language, as

an illustration of this supposition. "An entertainment was given by some great personage to a numerous and mixed company: in the course of it, a trinket was displayed, the value of which had, by I know not what operation of the principle of association, been raised, in his imagination and affections, above all ordinary estimation. On a sudden, an alarm was given that the precious article was missing. 'Let every man of us be searched,' said one of the company. 'Yes, let every man of us be searched,' said all the rest. One man alone refused: the eyes of all were instantly upon him: his dress betrayed symptoms of penury: no doubt remained about the thief. He entreated and obtained of the master of the house a moment's audience in a private room. His pockets were turned inside out, when in one of them was found — not the lost trinket, but something eatable. He had a wife who, for such or such a time, had gone without food." This was a secret, the public exposure of which he had resisted.

(9) *Silence under Accusation.* This circumstance is subject to the following infirmative considerations: The accused or suspected party, owing to deafness, or any other cause, may not have *heard* the criminative question asked, or observation made. If he heard it, he may not have *understood* it as conveying an imputation against himself. If he heard and understood it, he may not have been *able* to reply at the moment, owing to temporary impediment of utterance, or a feeling of surprise at the imputation conveyed. The subject of the statement may have been a matter not within his *knowledge*. The statement may have been made under circumstances *not calling for a reply*.

(10) *Evasive and Incomplete Response.* The following infirmative considerations may be mentioned under this head:

It may be a case where the appearance observed, and required to be explained, such as blood on the clothing, although criminative on its face, was not so in fact; but the accused having been subjected to it without his knowledge, as by having come in contact with a bleeding body in the dark, was, although innocent, actually *unable* to explain its existence. It may be a case where the accused, though innocent, could only explain particular circumstances, by criminating *other* individuals whom he was unwilling to expose, or disclosing facts which he was anxious, if possible, to conceal. It may be a case where the accused, though not guilty of the offense charged, could only prove himself so by showing his guilt of some *other* offense. It may have been considered by the accused his best policy not to disclose the particulars of his defense, until *judicially* demanded of him on his trial.

(11) *False Response.* It may be attributable to the same cause which has sometimes led innocent persons to resort to *false evidence* in their defense, as by actually fabricating facts and appearances, in order to produce false impressions.

149. THE ESCAPED CONVICT'S CASE. (H. L. ADAM. *The Story of Crime*. 19—. p. 171.) . . .

Some time ago, a prisoner who escaped from Dartmoor was recaptured in a curious manner. He had succeeded in getting beyond the boundaries of the prison property, had secured a change of clothing, and was within an ace of getting clear away. He had to pass a police

station, and as he approached it, he observed a police constable standing outside with a dog. Pulling himself together he put on indifference and managed to pass the policeman without raising his suspicions. Having got a few yards away, he suddenly heard the dog bark behind him and run towards him. Thinking that the policeman had "spotted" him, he took to his heels. This brought the policeman after him, and he was taken. The dog was merely barking at him as dogs will bark at passing people, and it was not until he ran away that the policeman's suspicions were aroused. . . .

Some years ago a schoolmaster was found murdered in his study. He had been hit over the head with a blunt instrument. The assistant master, who it was proved had been enamored of his employer's wife, was arrested and charged with the crime. The theory propounded by the prosecution was as follows. At the time the crime was committed the pupils were playing in the open ground adjoining the school, and the assistant master was with them. The deceased had gone into his study to seek a little repose, and was dozing. The assistant, so the prosecution argued, left the pupils, crept noiselessly into the house, secured the weapon,

made his way to the study, committed the crime, rejoining the pupils in the playground as though nothing had happened. The defense, however, were able, by means of timing the man's supposed movements, to make it appear a physical impossibility for him to have committed the deed in the manner set forth. But the most pregnant evidence of all was that which turned on a mere trifle. One of the witnesses for the prosecution was a small boy, a pupil, who testified that he saw the prisoner emerge from the house and come up to the boys as they were tossing coins in the air. He exclaimed, said the witness, "You don't know how to toss coins, let me show you," at the same time taking hold of a coin and spinning it in the air. Whereupon the judge put this question to the witness, "Did the prisoner's hand shake?" to which the witness replied that it did not. That practically saved the prisoner's life; if the reply had been in the affirmative, it would probably have sealed his fate. The judge argued that it was highly improbable that a man could come fresh from such a violent deed as that and toss a coin in the air without his hand shaking. Opinions, however, will differ on this point.

150. **MULLINS' CASE.** (ARTHUR GRIFFITHS. *Mysteries of Police and Crime*. 1898. Vol. I, p. 23.)

. . . Criminals continually "give themselves away" by their own carelessness, their stupid, incautious behavior. It is almost an axiom in detection to watch the scene of a murder for the visit of the criminal, who seems almost irresistibly drawn thither. The same impulse attracts the French murderer to the Morgue, where his victim lies in full public view. This is so thoroughly understood in Paris that the police keep officers in plain clothes among the crowd which is always filing past the plate-glass windows

separating the public from the marble slopes on which the bodies are exposed. An Indian criminal's steps generally lead him homeward to his own village, on which the Indian police set a close watch when a man is much wanted. Numerous instances might be quoted in which offenders disclose their crime by ill-advised ostentation: the reckless display of much cash by those who were, seemingly, poverty-stricken just before; self-indulgent extravagance; throwing money about wastefully; not seldom

parading in the very clothes of their victims. A curious instance of the neglect of common precaution was that of Wainwright, the murderer of Harriet Lane, who left the corpus delicti, the damning proof of his guilt, to the prying curiosity of an outsider, while he went off in search of a cab.

One of the most remarkable instances of the want of reticence in a great criminal and his detection through his own foolishness occurred in the case of Mullins, the Stepney murderer, who betrayed himself to the police when they were really at fault, and their want of acuteness was the subject of much caustic criticism. The victim in this case was an aged woman of eccentric character and extremely parsimonious habits, who lived entirely alone, only admitting a woman to help her in the housework for an hour or two every day. . . . She was last seen on the evening of the 13th of August. When people came to see her on business on the 14th, 15th, and 16th, she made no response to their loud knockings, but her strange habits were well known; moreover, the neighborhood was so densely inhabited that it was thought impossible she could have been the victim of foul play. At last, on August 17th, a shoemaker, named Emm, whom she sometimes employed to collect rents at a distance, went to Mrs. Elmsley's lawyers and expressed his alarm at her non-appearance. The police were consulted, and decided to break into the house. Its owner was found lying dead on the floor in a lumber room at the top of the house. Life had been extinct for some days, and death had been caused by blows on the head with a heavy plasterer's hammer. The body lay in a pool of blood, which also splashed the walls, and a bloody footprint was impressed on the floor, pointing outwards from the room. There were no appearances of forcible entry to the house, and the con-

clusion was fair that whoever had done the deed had been admitted by Mrs. Elmsley in all good faith. . . . Yet the police made no useful deductions from these data.

While they were still at fault, a man, named Mullins, a plasterer by trade, who knew Mrs. Elmsley well and who had often worked for her, came forward voluntarily to throw some light on the mystery. A month had nearly elapsed since the murder, and during this long period Mullins' attention had been drawn to the man Emm and his suspicious conduct. Mullins had served in the Irish constabulary; his powers of observation had been quickened by this early training, and he soon saw that Emm had something to conceal. He had watched him, had frequently seen him leave his cottage and proceed stealthily to a neighboring brickfield, laden on each occasion with a parcel he did not bring back. Mullins, after giving this information quite unsought, led the police officers to the spot, and into a ruined outbuilding, where a strict search was made. Behind a stone slab they discovered a paper parcel containing articles which were at once identified as part of the murdered woman's property. Mullins next accompanied the police to Emm's house, and saw the supposed criminal arrested. But to his utter amazement the police turned on Mullins and also took him into custody. Something in his manner had aroused suspicion; and rightly, for eventually he was convicted and hanged for the crime.

Here Mullins had only himself to thank. Whatever the impulse—that strange restlessness that often affects the secret murderer, or the consuming fear that the scent was hot, and his guilt must be discovered unless he could shift suspicion—it is certain that but for his own act he would never have been arrested. It may be interesting to complete this case, and show how further suspicion settled around

Mullins. . . . The most conclusive evidence was the production of a plasterer's hammer, which was also found in Mullins' house. It was examined under the microscope, and proved to be stained with blood. . . . So far as Emm was concerned, he was able clearly to establish an alibi, while witnesses were produced who swore to having seen Mullins coming across Stepney Green at dawn on the day of the crime with bulging pockets stuffed full of something, and going home; he appeared much perturbed and trembled all over. Mullins was

found guilty without hesitation, and the judge expressed himself perfectly satisfied with the verdict. The case was much discussed in legal circles and in the Press, and all opinions were unanimously hostile to Mullins. The convict steadfastly denied his guilt to the last, but left a paper exonerating Emm. It is difficult to reconcile this with his denunciation of that innocent man, except on the grounds of his own guilty knowledge of the real murderer. In any case, it was he himself who first lifted the veil and stupidly brought justice down on himself.

151. THE UNCLE'S CASE. (Sir E. COKE. *Third Institute*, c. 104, p. 232.)

In the county of Warwick, there were two brethren; the one having issue a daughter, and being seized of lands in fee, devised the government of his daughter and his lands until she came to her age of sixteen years, to his brother, and died. The uncle brought up his niece very well both at her book and needle, etc., and she was about eight or nine years of age; her uncle for some offense correcting her, she was heard to say, "Oh! good uncle, kill me not!" After which time the child, after much inquiry, could not be heard of, whereupon the uncle, being suspected of the murder of her, the rather for that he was her next heir, was upon examination, anno 8 Jac. Regis, committed to the jail for suspicion of murder; and was admonished by the justices of assize to find out the child, and thereupon bailed him until the next assizes. Against which time, for that he could not find her, and fearing what would fall out against him, took another child as like unto her both in person and years as he

could find, and appareled her like unto the true child, and brought her to the next assizes; but upon view and examination she was found not to be the true child; and upon these presumptions he was indicted and found guilty, had judgment, and was hanged. But the truth of the case was, that the child, being beaten overnight, the next morning, when she should go to school, ran away into the next county; and being well educated was received and entertained of a stranger; and when she was sixteen years old, at which time she should come to her land, she came to demand it, and was directly proved to be the true child.

Which case we have reported for a double caveat; first, to judges, that they in case of life judge not too hastily upon bare presumption, and, secondly, to the innocent and true man, that he never seek to excuse himself by false or undue means, lest thereby he, offending God (the author of truth), overthrow himself as the uncle did.

152. GEORGE RAUSCHMAIER'S CASE. (ANSELM VON FEUERBACH. *Remarkable German Criminal Trials*. 1846. transl. Gordon, p. 291.)

[In Augsburg, April 20, 1820, Maria Holzmann, a charwoman, aged 55, disappeared from her home.

She lived on the upper floor, and sublet a room below to George Rauschmaier and Joseph Steiner.

Her body was afterwards found in the loft. Rauschmaier and Steiner were arrested. Rauschmaier afterwards confessed. Meanwhile Steiner denied his own guilt, but sought to turn suspicion on Rauschmaier.]

On his first regular examination of the 2d of January, 1821, he asserted not only his own innocence, but also his ignorance of the cause of Holzmänn's disappearance. . . . He was examined on the 15th of January, merely with regard to his family and to his means of subsistence, when he began suddenly and of his own accord, a long, rambling narrative to the following effect:

That he returned home about ten or eleven at night on Good Friday, and went to wish his landlady good night, as was his usual custom; but not finding her in bed, he thought that she would not return that night, and thereupon got into her bed himself. During the night he heard a heavy fall overhead, and a noise as if something was being dragged backwards and forwards. On the Saturday he came home about ten at night: his comrade opened the door to him, and would not allow him to enter his landlady's room, but lighted him at once to his own. He had scarcely lain down when something dropped from the ceiling upon his nose, and when he turned in bed, upon his back. In the morning he found that this was blood. He called Rauschmaier's attention to this, who answered that he could not account for it, but that it was of no consequence. At first he thought nothing of it; but, on seeing Holzmänn's remains in the churchyard, the thought struck him that she must have been murdered by Rauschmaier. He himself had never harmed her. . . .

On the 4th of February he requested another audience. . . . He now modified his former statement; it was not on Friday, but on Saturday, that he had slept in Holzmänn's bed, and the blood had

dropped upon his nose on the Thursday night, not on Good Friday. He had said to Rauschmaier, early on Friday, "Surely, in God's name, you have not murdered our landlady?" whereupon Rauschmaier threatened to kill him if he said a word about the blood or their landlady. He then showed him a thick knotted club, saying, "I will strike you dead with this if you say a word of the matter!" . . . He then proceeded, after some interruption, "It now strikes me that the blood must have been wiped up on Easter Sunday with my shirt, which I found in a corner soaked with blood. No doubt my comrade did this on purpose to throw the suspicion on me." . . . He further added, that a week after Easter he was with Rauschmaier at a tavern, and when they were alone his comrade offered him a silver ring and a pair of earrings, to say nothing about the blood or their landlady; but he would take nothing from him.

Steiner's statement had every appearance of truth, and agreed in the main with what was already known: and so long as Rauschmaier withheld his confession it appeared of the utmost importance. But when the latter was asked, after making a full confession, whether any one was privy to the murder which he had committed, he answered, "No human being; I resolved upon and committed the murder alone, exactly as I have already confessed it, because I trusted no one; if, perchance, Joseph Steiner or Elizabeth Ditscher are suspected, I hereby attest their innocence; nor do I believe that Steiner saw anything, at any rate he never gave me to understand that he suspected me." In the following examination when he was told that Steiner asserted that he had discovered traces of the murder, and that he had taken Rauschmaier to task about it, the latter replied, "It is a thorough lie; he never said a word to me of the matter." . . .

At Steiner's third examination the discrepancy between his statement and Rauschmaier's repentant confession was fully explained. The judge called Steiner's attention to some marked contradiction, whereupon he exclaimed, "I am an ass, and have said a great deal that is not true. I must beg pardon for having lied so much. I thought to myself that, perhaps, my comrade murdered the woman, and that I was suspected, although I am innocent; I therefore said whatever came into my head to strengthen the suspicion against Rauschmaier, and to convince you of my own innocence. All that I have said about the blood dropping upon my nose, and my shirt, about the noise of one falling and being dragged over head, and about my observations to Rauschmaier, his threatening words, promises, and so forth, are mere inventions. I neither saw nor heard anything; but I suspected that

Holzmann had been murdered by Rauschmaier. I then considered how it must all have been done, and told it accordingly. I wonder how it all came into my head; I should soon have believed the story myself. Forgive my stupidity. I am a mere ass. Only think how stupid! I now begin to see what trouble I have got myself into by my lies; but I hope I shall not suffer for them, as I did not harm the old woman. I thought I was doing the court a pleasure by saying what I fancied about Rauschmaier, for I still believe him to be guilty." . . .

On the 9th of May, 1822, Rauschmaier was found guilty of murder, and condemned to death by the sword, with previous exposure for half an hour in the pillory. Steiner was acquitted, and Elizabeth Ditscher was condemned to an eight days' imprisonment for receiving stolen goods.

153. **ROBERT HAWKINS' CASE.** (G. L. CRAIK. *English Causes Célèbres*. 1844. p. 146.)

[The accused, a clergyman, was charged in 1668 with robbery from one Larimore. The facts are more fully stated *post*, No. 335. The charge was said by the defendant to be due to a long-standing spite of Larimore, and to his plot to ruin the accused. But one of the circumstances against the accused was that he had refused to let his house be searched for the robbed goods.]

L. C. B. HALE. — Sir, but if you were innocent of this robbery, why did you refuse to open your doors, or to have your house searched?

Hawk. — My Lord, I had several reasons that moved me so to do. 1. In general, most of those persons that were present were my inveterate enemies, and several of them had threatened to ruin me and my family; and therefore I had reason to suspect that they came to injure me, either in my profession or goods. For the first, Sir John Croke and

Larimore had often threatened to pull down my house, and for that end had hired several persons to make a forcible entry upon it; and, particularly they had lately hired Jaires, the son of Leonard Styres, of Thame, in the country of Oxon, by a ladder to climb up, and run down my chimney, and open my doors, when we were all abroad. And about the same time they also contracted with one Christopher Tyler, of Chilton, for the same purpose. And — 2. I feared the seizing of my goods by the said persons, because they had then a writ of Levary (or execution) to seize them, which Larimore's son had a few days before in part executed, and he was then present. And if these reasons are not sufficient, I have more to justify my act in refusing to have them search my house. . . .

L. C. B. — Mr. Hawkins, can you prove what you have said? *Hawk.*

— Yes, my Lord. Which particular shall I prove?

L. C. B. — Prove that about the ladder, if you can. *Hawk.* — I pray, my Lord, call *John Acreman*. He, being called, did fully justify what was said concerning their intended forcible entry, and added further, that he did help to set up the ladder for that purpose, being called by Sir John Croke's own sons, they and

Larimore standing by all that time to watch.

Hawk. — And touching the second particular, concerning the seizing of my goods, Mr. Sheriff himself can justify, that they had then in their hands such a writ. . . .

My Lord Chief Baron *HALE* hearing these reasons fully proved, commended Hawkins' discretion in not opening his doors.

154. **DONELLAN'S CASE.** (W. WILLS. *Circumstantial Evidence*. Amer. ed. 1905. p. 114.)

Perhaps in no case have circumstances of this kind told with such fatal effect as in the case of Donellan [stated more fully, *post*, No. 379], who was convicted of the murder of Sir Theodosius Boughton by poison. The prisoner, after having [supposedly] administered the fatal draft in the form of medicine, rinsed out the vial which had contained it, and when that fact was stated before the coroner, he was observed to check the witness by pulling her sleeve. In his charge to the jury, Mr. Justice *BULLER* laid great stress upon that circumstance. "Was there anything so likely," said the learned judge, "to lead to a discovery as the remains, however small they might have been, of medicine in the bottle? But that is destroyed by the prisoner. In the moment he is doing it, he is found fault with. What does he do next? He takes the second bottle, puts water into that, and rinses it also. He is checked by Lady Boughton, and asked what he meant by it — why he meddled with the bottles. His answer is, he did it to taste it; but did he taste the first bottle? Lady Boughton swears he did not. The next thing he does, is to get all the things sent out of the room; for when the servant comes up, he orders her to take away the bottles, the basin, and the dirty things. He puts the bottles into her hand, and she was going to carry them away, but Lady Bough-

ton stopped her. Why were all these things to be removed? Why was it necessary for the prisoner, who was fully advertised of the consequence by Lady Boughton, to insist upon having everything removed? Why should he be so solicitous to remove everything that might lead to a discovery?" After dealing with the prisoner's conduct in other matters, the learned judge continued: "Then as to the conduct of the prisoner before the coroner. Lady Boughton had mentioned the circumstance of the prisoner's rinsing out the bottle — one of the coroner's jury swears that he saw him pull her by the sleeve. Why did he do that? If he was innocent, would it not be his wish and anxious desire, as he expresses in his letter, that all possible inquiry should be made? What passes afterwards? When they got home, the prisoner tells his wife that Lady Boughton had given this evidence unnecessarily; that she was not obliged to say anything but in answer to questions that were put to her, and that the question about rinsing out the bottles was not asked her. Did the prisoner mean that she should suppress the truth? that she should endeavor to avoid a discovery as much as she could by barely saying Yes or No to the questions that were asked her, and not disclose the whole truth? If he was innocent, how could the truth affect him? but at that time

the circumstance of rinsing out the bottles appeared even to him to be so decisive that he stopped her on the instant, and blamed her afterwards for having mentioned it.

All these," said the learned judge, "are very strong facts to show what was passing in the prisoner's own mind."

155. **ROBERT WOOD'S CASE.** (C. AINSWORTH MITCHELL. *Science and the Criminal*. 1911. p. 121.)

... The most sensational trial that has taken place in this country for many years was that of Robert Wood, a young artist, in 1907, on the charge of murdering a woman. The story of the crime itself is a particularly sordid one, but the behavior of the prisoner in court, and the excited state of public feeling on the subject gave a profound psychological interest to the trial. A woman had been found brutally murdered in her lodgings in a small house in Camden Town, and no trace could be found of the murderer. In the fire grate, however, had been found some charred fragments of a letter, while in the chest of drawers a postcard that had escaped notice had been discovered. A reproduction of this postcard was posted up at the police stations and published in the papers, and was soon recognized by several people as being in the handwriting of Robert Wood.

In the meantime, Wood, finding that suspicion was likely to attach to him, persuaded a girl of his acquaintance, named Ruby Young, to promise to support his statement that he had been with her upon the evening when the murder took place. A day or two later Ruby Young became uneasy as to the effect her promise was likely to produce, and asked the advice of a journalist as to what would be the best thing to do, putting the case as a hypothetical one. The man, however, at once saw to what she alluded, and immediately telephoned to the police, and this led to the arrest of Robert Wood.

At the police court proceedings an expert opinion was given that

the fragments of charred paper found in the grate of the dead woman were in the handwriting of Wood, and evidence was also given by the present writer that the pigment in which the characters were written was identical with that of a marking-ink pencil found upon the prisoner. For a long time Wood denied that he had had anything to do with these fragments. Subsequently, at the beginning of the trial at the Old Bailey, he admitted that he had written them, though to the end he strenuously refused to admit that the words had the meaning which they appeared to suggest. He denied that they referred to any appointment made with the dead woman for the day upon which she was murdered. The proof of the fact that these bits of charred paper had really been written by Wood brought him very close to the scene of the crime, and his attempt to create a false alibi and to get Ruby Young to bear this out still further strengthened the suspicion against him. The most telling evidence, however, was the statement of a carman, who had, he asserted, seen a man leave the house of the murdered woman at five o'clock in the morning. He had not seen the face of the man, but had noticed that he had a characteristic swinging walk, and when taken to the police station had identified the prisoner among a number of other men, who had been made to walk round the yard, as the man that he had seen coming down the steps of the house. Other evidence was given as to Wood's having been seen in the company of the deceased woman on several occasions in the past, although he

asserted that he had only known her a few days and had seen her only once or twice. The bad reputation of most of these witnesses detracted from the value of their evidence. Mr. Marshall Hall, who conducted Wood's defense, made a very brilliant speech, in which he laid stress upon the weak points in the case for the prosecution — the evidence that had been gathered from a tainted source, the complete absence of any motive for the crime, and the fact that the jury were trying the prisoner for murder and not for immorality or lying. He urged that the keynote in this case was that Wood, who had a great deal of vanity, could not take upon himself the responsibility of admitting what would cause him to occupy a lower position in the estimation of those who had given him their undivided respect and affection. . . .

The chief evidence called for the defense was that of Wood's father and brother, who stated that he was at home on the night of the murder, and that of a neighbor who had lived beneath them, who had seen Wood come home that evening. A ticket collector named Westcott, employed at King's Cross station, stated that he lived in the same road, and that on the early morning, when Wood was stated to have been seen, he left his house at five minutes to five. He was then wearing a loose overcoat. Westcott was a broad-shouldered man, and a boxer, and had a brisk swinging walk. It was this man, it was suggested, whom McGowan had mistaken for Wood. Wood, himself, was put into the box and gave his evidence in a low, and at times, nearly inaudible voice, though he showed not a sign of nervousness. He gave emphatic denials to the questions put to him in cross-examination by Sir Charles Matthews, but he admitted having lied in the matter of the false alibi that he had attempted to set up. He was, he said, in a tight corner, and any man would have done the

same if placed in the same conditions. With reference to the fragments of paper on which were words in his handwriting he denied that they were part of a letter, and suggested that it might have been some scrap of writing taken from his pocket by the dead woman. The theory of its referring to an assignation was, he suggested, an act of imagination on the part of the prosecuting counsel.

The judge, Sir William GRANTHAM, in summing up the case, pointed out that had it not been for the conduct of Wood himself in telling lies and keeping back what he knew, there would have been no justification for such a lengthy trial. The evidence of McGowan was, he said, open to a certain amount of doubt owing to the fact that the witness had not mentioned at once about having noticed a peculiarity in the walk of the man he saw leaving the house in St. Paul's Road, just before five o'clock on the morning of September 12th. . . .

It was a quarter to eight in the evening when the jury retired to consider their verdict, and before eight had struck they were back again in court, and had pronounced their verdict of "Not guilty." Cheer on cheer swept through the court, and for some minutes it was impossible for the judge and the court officers to obtain silence. Men and women thronged round the dock eager to grasp the hand which Robert Wood held out to them over the rail. Outside, in the street, the dense mob that thronged up to the very doors of the court, took up the cry, and yelled itself hoarse with the words "Not guilty. Not guilty." . . . Robert Wood had become the popular hero of the hour. It is difficult how to account for this hero-worship of a man who had done nothing to justify such worship, except upon the theory of an emotional infection that had destroyed the balance of collective judgment.

TITLE V. THE DATUM SOLVENDUM

156. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)

In the foregoing outline of the classes of Probanda and the principal kinds of circumstantial inference usable to prove each kind, it has been assumed that the Probandum is a simple and known fact. But in practice neither of these assumptions is usually correct. The Probandum may be more or less *complex*, and it may be more or less *disputed*. What is the effect of these two features on the reasoning process in dealing with the evidential circumstances?

A. Probandum Complex. When the Probandum is complex, each item of complexity affects the range of evidential facts, and the force of the inferences, by fixing some detail of the Probandum to which the proof must be directed. Take the simple fact of a murder on Jan. 21. When a particular person is charged as the doer, we may argue that the accused was near the place at the time when the death occurred; that he was seen running away soon afterwards; and that he has a bad character for robbery by violence. These are generic evidences suitable for any murder in general. But if the further details are given, that the deceased was killed by poison which must have been taken twelve hours before, on Jan. 20, and that a large sum of money was found untouched on his person, the Probandum now becomes: an act of giving poison on Jan. 20, and no motive of taking the deceased's money. Thus the direction of the proof is substantially changed, and with it the relevant evidence. Presence on Jan. 21, and the motive of robbery, do not now point to this killing. The added details thus are essential to know in estimating the proof. Take again the case of a robbery of a bank vault. If the article missing is a roll of money, the kinds of evidence pointing to a particular person will be of one sort; but if the article missing is a contract needed for closing an investment at the next director's meeting, the evidence would be quite different; and if it were a bundle of non-negotiable securities essential for showing a correct balance to the bank examiner at his next visit, the proof must be given a still different direction.

In another aspect, Complexity of detail is important. It may, and usually does, involve more than one of the foregoing classes of Probanda, — External Event, Identity, Human Quality, and Human Act. A Probandum involving only one of these is indeed the unusual feature. Hence, the Probandum must be analyzed into its components, so that the various evidential facts can be grouped so as to exhibit their respective indications. In a murder charge (for example, Courvoisier's), where the one question is whether the murderer was an inmate of the house, or an intruder, and a

back door is found with breaks and marks, the cause of these breaks and marks depends on their physical features, *i.e.* it is a fact of External Nature. So in a railroad accident, a part of the issue may be whether a broken rail or a misplaced switch was its cause; this is a fact of External Nature; but along with it may thus be involved the issue, Who turned the switch; and here a Human Act and its appropriate evidences become a subject of proof.

Every Probandum, then, may be complex; and the details of its complexity will affect the probative use that may be made of facts offered as evidence.

B. Probandum Disputed. When the Probandum is disputed, the probative effect of specific evidential facts cannot be surely known until the Probandum is settled. Hence, to this extent, its effect is only hypothetical in the meantime. The Probandum sometimes is disputed, sometimes not, in practice. For example: A tree on a suburban lawn is cut down; if this is undisputed, the only issue is, Did X cut it down? But, instead, suppose that it is disputed whether a tree was cut down at all; we may be able to prove that there was a tree there yesterday and that there is only a deep hole there to-day, and we may not prove that a tree was cut down at all; thus the issue whether X cut it down is never reached. Or suppose that the X Co. is charged with the loss of a bag of valuables left in a railroad car; whether an intruder or an employee took it, is here the issue. But perhaps it is disputed whether there was ever any bag there to be taken; here arises a prior issue, and the other issue may never really arise. Or, again, on a charge of the murder of M, M's body is found; and the only issue is, Did X kill him? But perhaps the death of M is itself disputed; we may proceed to show that M was last alive seen in his office on Saturday afternoon; that he did not come home that night, and that a body was found in the river two weeks later. If this is not enough to prove the death, then no issue as to X's causing it can arise. This feature, in criminal cases, leads to the well-known maxim that the "*corpus delicti*" must first be clearly proved.

Thus, the Probandum may be in dispute; and this dispute may itself involve a separate mass of proof directed to an External Event, a Human Act, etc.

Furthermore, a dispute as to a detail in a complex Probandum may leave the whole direction of proof of the Act in a hypothetical condition until the detail be regarded as settled. For example, if a homicide is committed, a detail of the Probandum may be that a pocketbook full of money was missing from the deceased's person. Suppose this is disputed; then the Probandum becomes, not a homicide for money, but a homicide for some other motive; and thus the direction of the whole line of motive evidence remains in suspense until this detail be regarded as settled. Again, in the Holt Will Case (*post*, No. 390), the supposed will arrived by mail in the hands of the registrar of probate, and was a document partly burned and bearing the attesting signatures of General Grant and General Sherman. One hypothesis was that the document was not genuine; the other was that it was a genuine document revoked by the testator. But these hypotheses were inconsistent, and obviously affected in essential ways the probative bearing of various evidential facts. Again, in the Kent Case (*ante*, No. 111), if it could have been determined whether a deceased was

killed by choking, or by cutting the throat with a razor, the direction of proof as to the doer would have been materially affected.

Thus, in the common case where the doing of a Human Act is to be the main issue, the fixing of the Probandum and its details becomes a preliminary and independent process of great importance. This may be termed the process of *fixing the datum solvendum*.

The canon which rests on the feature of *Complexity* may be thus phrased :
(A) *Determine, classify, and state with precision, as many details as possible of the Datum Solvendum.*

The canon which rests on the feature of *Disputability* may be thus phrased :
(B) *Distinguish the (practically) disputable and indisputable details of the Datum Solvendum; treat as hypothetical all lines of proof of the Act which are dependent on the former; and for each disputable detail trace beforehand the effect of either settlement of it upon the lines of proof.*

Ordinarily, to be sure, the importance of thus giving explicit statement to the Datum Solvendum ends with the process of the detection of the doer and the preparation of the evidence. By the time a case is presented before the jury, all of the details of the Datum have taken a fixed shape, and all of the evidence is marshaled with a view to that precise shape. *E.g.* whether the deceased was a man or a woman would doubtless be important in searching for clues to the murderer, and in collating the evidence; but by the time the case is presented, the prosecution will have made up its mind which is the fact; and if that fact be that the deceased was a woman, then all the evidence *pro* and *con* will be directed to the issue, Did the deft kill this woman? Thus, the labor devoted to the settlement of this detail will have been spent before the issue is joined; the course of the evidence will already have been settled; and the deliberations of the tribunal will not be affected by any uncertainty of the Datum Solvendum.

But from time to time cases are presented in which both the complexity and the uncertainty of the Datum Solvendum remain after the evidence has been prepared. It is presented, in part, therefore, hypothetically. Thus the tribunal must use caution in separating the detailed issues and in noting the uncertainty of some part of the probandum. In Thornton's Case (*post*, No. 162), for example, the uncertainty of the place and time of death made all the difference in the effect of the alibi evidence. In Hatchett *v.* Com. (*post*, No. 378) the fact that the deceased had died from poison or from colic was open to argument. In such cases, therefore, the Datum Solvendum and its details remain for the consideration of the tribunal during the course of the evidence; and the tribunal's ultimate application of the evidence cannot be made until it has reached a conclusion as to the Datum Solvendum.

The following cases (Nos. 159–162) serve to illustrate the importance of an accurate fixing of the Datum Solvendum.

157. ALEXANDER M. BURRILL. *A Treatise on Circumstantial Evidence*. (1868. pp. 253, 583.) In the application of circumstantial evidence to the judicial investigation of the truth of criminal charges, the principal or central fact just spoken of is the crime supposed and charged to have been committed. The proof of the general fact of a crime committed, or "*corpus delicti*" (as it is technically termed), is sometimes a short and simple process;

the circumstances being few, but cogent in their indications, and the conclusion sought, manifest and irresistible. A cry of distress is heard from a building or apartment, followed, successively, by sounds as of a mortal struggle and a heavy fall. The place is entered as quickly as possible, and a person is found extended on the floor, dying from mortal wounds visibly inflicted with a sharp instrument, in such a part of the body, or in such numbers or directions, as to forbid the supposition of suicide, and the instrument itself is nowhere to be found. . . .

Supposing it proved, and returning to the general view just taken, of minor facts in their relative position as surrounding a principal fact, the process of *aggregating* these elementary circumstances into a body of evidence may be most conveniently illustrated by beginning with a single circumstance, and adding to it another; and so proceeding gradually by a succession of additions.

The original basis of all the investigation which is undertaken, is the case or transaction, *as it actually occurred*; composed, in addition to the principal act of the crime itself, of a variety of circumstances, — precedent, concomitant, and subsequent, — of physical facts, psychological facts, and facts of conduct, — all consistent with each other, and all connected with each other and with the criminal act, in a certain order and relation. This is the case or transaction, in its *absolute* form of reality and truth. But this transaction, having had only a transient existence, has passed away. . . . As a whole, in its full character and extent, and in the true relation of all its parts, it was unknown to any human being besides the perpetrator (supposing it the work of a single agent), and none but he can fully represent it in a narrative of the past. It has, however, left traces, more or less numerous, consisting of physical objects and appearances (some still existing in specie) and contemporaneous impressions made on the senses and memories of individual observers. The great object of all investigation is to collect these scattered remnants and vestiges of action; to examine and compare them; to adjust them to each other, by means of indications which they themselves immediately furnish, as well as by the aid of general principles of presumptive reasoning; to ascertain, as it were, their original places and positions; and, by this means, to *reconstruct* the case, as far as possible, out of them; to *recall* it from the past, and to present it as a subject for consideration, in a state of as close approximation to the form of its original occurrence as may be practicable. The more adequately this is done, the more easy does the process of investigation become, and the more accurate are the conclusions ultimately reached by it.

The following list of items illustrates the kinds of detail there to be sought in *Physical Facts or Circumstances*:

1. The *subject* of the offense. As, in murder, the person killed, or mortally injured, or the remains of such person: in arson, the building burned, or its remains: in rape and robbery, the person assaulted or violated: in robbery and larceny, the thing stolen: in burglary, the building broken into: in forgery, the money or instrument fabricated: and the like.

2. The *appearances* of such subject. As, in murder, the position of the body, as left by the criminal, or as concealed by burial, immersion in water, or otherwise; wounds and marks of violence visible upon it; the position, direction, and number of the wounds, and their particular appearances;

foreign substances, attached or adhering to the body; marks of violence visible upon the dress; mutilation, dismemberment, and destruction of the body, or portions of it; outward appearances indicative of poison; detection of poison in the body: in rape and robbery, marks of violence, stains of blood upon the person or clothing: in arson, the appearances of a fire kindled by design: in burglary and robbery, marks of violence upon windows, doors, walls, and the like.

3. The *instruments* of the offense. As, in murder, the weapon or instrument of death, — the gun, pistol, knife, dagger, razor, hatchet, axe, club, or stone; the poison and its vehicle; the cord or handkerchief for strangulation; the explosive machine: in rape and robbery, the stupefying liquor or drug: in arson, the combustibles, matches, lights, and inflammable substances: in burglary, the keys, picks, crows, saws, chisels, and other burglars' tools: in forgery and counterfeiting, the dies, presses, coining tools, chemical agents, and the like.

4. The *appearances* of such instruments: such as signs of a firearm having been recently discharged; stains of blood upon a knife, sword, or hatchet; curvature of a sword blade; indentations or fractures of a club; fragments of an exploded machine; combustible substances strewed about and saturated with an inflammable liquid.

5. The *place* of the offense, or scene of the crime: as the building, yard, street, road, field, thicket or wood, vehicle or ship, where the victim of the murderous or violent assault is found, or to which he or she is decoyed or forcibly carried; the chamber where the poison is administered, or into which the explosive machine is conveyed; the apartment where the coin is counterfeited; and the like.

6. The *place* of the offense, considered as the instrument or *means* of its commission: as the pond, pit, well, or stream where the body is drowned; the rock or precipice over which it has been pushed or thrown; and the like.

7. The *appearances* of the place or scene of the crime, or of neighboring bodies or places. As, in murder, the bloody floor, bed, chair, path, or road; spots or stains of blood on the walls, doors, etc., of a house; or on well curbs, gates, stiles, or fences; or on trees, grass, snow, or the ground itself; especially when concealed or attempted to be concealed from view; marks of instruments of violence, as indentations, discolorations, or perforations made by a ball from a firearm, or the stroke of a heavy implement; marks made by the explosion of a machine; marks of struggles, or resistance to violence; marks of footsteps at the place, or leading to or from it; marks or impressions of certain parts of the offender's body, as of the knee, or hand, bloody finger marks, etc.; marks made by dragging a body into a place of concealment; lights burning on premises at unusual hours; lights suddenly extinguished. In arson, traces of smoke or flame. In burglary, marks of burglars' instruments, and the like.

8. *Sounds* heard at the scene of crime, or in its vicinity: such as cries of distress; reports of firearms; sounds of an explosion, of bodies falling, of footsteps, of a scuffle, and of voices; alarms given by animals; the sound of wheels, or sleigh bells, or of the trampling of a horse; noises made by bursting in a door; sounds heard from locked-up premises, such as the clashing of steel, the shivering of glass, the moving of articles about, the tearing

of cloths, the rubbing of a floor, the running of water, the sawing of boards, hammering, and the like; total silence immediately following unusual or alarming sounds.

9. *Smells* of smoke or burning substances; the odor of poisonous substances; the odor of inflammable liquids prepared for arson and the like.

10. Impressions on the sense of *touch*: as the heat of a wall, indicating an unusual fire; the heat or coldness of ashes in a stove; and the like.

11. Impressions on the sense of *taste*: as of a poison to which the tongue is applied; of a garment saturated with salt water; and the like.

12. *Detached bodies* found at the scene of crime, or in its vicinity: as articles of dress, or portions of them; patches for the charge of a rifle; a ball extracted from the woodwork of a house, or found at the foot of a tree; the ramrod of a pistol; grains of wheat scattered about; and the like.

13. Symptoms of *poison*: as contortions of the body, spasms, vomiting, swelling, discoloration, complaint of burning and pricking sensations.

14. *Peculiarities* about the person of the *accused*: such as wounds, scratches, bruises; stains of blood upon the person or clothing; rents, incisions, and other injuries to clothing; disorder or wetness of the dress; stains of earth, or other substances; natural marks, such as the want of an eye, finger, or front tooth; the being left handed, or carrying the head on one side; peculiarities of size, shape, gait, and voice; appearances as of something concealed under the dress; and the like.

15. Peculiarities about *objects* in the possession of the accused: as the sweating and smoking of a horse in his stable, horsehair and lint adhering to a newly discharged rifle.

16. *Materials* of the subject-matter of the offense, or capable of being converted into instruments of the offense, including the means of their production. As, in murder, lead for casting bullets, bullet molds, leaves from which a poison could be distilled, utensils for distilling; in arson, materials for making inflammable substances; in forgery and counterfeiting, metal for coining, bank-note paper, bank-note plates engraved, or in process of being engraved, metallic or paper money in process of being fabricated; and the like.

17. *Receptacles* inclosing or having inclosed the subject, the instrument, or the fruits of the offense. As, in murder, the clothes of the person killed; the box or chest in which the body or its remains are concealed; the box for holding an explosive machine; the drawer, case, or trunk, in which pistols are found, or have been kept; vials or papers containing or having contained poison; in arson, the box or case for holding combustibles or secreting a candle; barrels containing inflammable liquids; in larceny or robbery, the closet, drawer, trunk, package, or case, containing or having contained the articles stolen; the floor or wall beneath or behind which they have been concealed; and the like.

158. HANS GROSS. *Criminal Investigation*. (transl. J. and J. C. Adam. 1907. p. 127.) . . . The investigator, however inexperienced, will commit no grave mistake if he always remembers the old and precious maxim of the jurist,

Quis, quid, ubi, quibus auxiliis, cur, quomodo, quando?

Who, what, where, with what, why, how, when?

“What was the crime, who did it, when was it done, and where,
How done, and with what motive, who in the deed did share?”

If these words be always kept prominently before one in one's office, they will be impressed on the memory and imagination, and prevent many a grave mistake. . . .

The extent of the description in the first place naturally depends on the nature of the crime. In all cases (we are not dealing with accidents) the following must be described:

1. The place itself; 2. The direction from which the guilty person came; 3. That in which he went away; 4. The spots whence the witnesses have seen, or could have seen, anything; 5. All points where traces of the crime are to be found or where they might have been expected to be found, but where in fact there are none.

The notification of even purely negative facts should not be neglected, for on the one hand they may lead to positive inferences and on the other reassure the reader and show him that they were not forgotten altogether. Suppose, *e.g.*, traces of blood are mentioned as having been found in the room of a murdered man; it is not sufficient merely to enumerate these, but what has not been found must also be stated, as *e.g.* that there was no bloody water in the wash-hand basin nor any imprints of blood-stained fingers — or hands; or if the report concerns a search for compromising papers which has been without result, it must be expressly stated that no ashes of burnt paper were to be found in the fireplace. The special circumstances attaching to each particular crime must of course be set out, *e.g.* in cases of arson the objects more especially exposed to danger or anything that may have assisted or impeded the wind — in riots, places from which weapons have been taken (such as a fence, pile of wood, thatched roof of a hut, etc.). After the general sketch, the actual place of occurrence must be described in detail, as *e.g.* in cases of murder the room containing the body of the victim, in cases of burglary the place where the house was broken into, or in arson the place where the fire first started. . . .

In doing this the Investigating Officer must proceed step by step examining minutely at the same time its description as written down. A piece of cloth, for instance, lying on the ground will be primarily described according to the impression it produced when first observed, as *e.g.* “Quite near the corpse, an inch from the left hand, a red cloth rolled up in a ball, apparently of cotton and about the size of a pocket handkerchief, one corner sticking out, lying on the ground in the direction of the head of the body. On picking up this piece of cloth it is found not to be cotton, but half silk. It is a three-cornered scarf with hemmed borders and each side 17 inches (43 cm.) in length. It is unmarked, and has a hole in the middle about the size of a pie-piece probably due to use. Under the scarf is no trace of blood or anything remarkable. It is not identified by any one present (naming those present, A, B, C, etc.); it probably therefore did not belong to the murdered person.” He then passes on to all the important details that may serve to throw light on the case, footprints, marks caused by firearms or tools, impressions of all kinds, in short everything which may

have been produced by the guilty person, and everything which may have been articles left behind by him. . . .

It is impossible to notice everything which may subsequently turn out to be of importance, even though folio volumes be written; for there are always certain details which will be passed over owing to the difficulty of foreseeing their value. In one case it turned out to be of great significance to know whether the sun shone into a certain part of the room at a certain hour of the day, and for this purpose the locality had to be specially revisited, though very far distant from the place where the court was sitting. In another case everything depended upon whether any sand was strewn about on the floor of the room, a point that no one had thought it worth while to observe. . . . The old axiom of the Civil Law "*De minimis non curat lex*" does not hold good for the Investigating Officer. Only too often he must seek the strongest proof in the smallest details. Every one has seen, every one has read in thousands of criminal tragedies, cases where some trifle has become the pivot upon which the whole case turned; and yet the capital fault in inspecting localities very often consists in the neglect of small details, the importance of which would have been apparent if a proper and sustained attention had been brought to bear upon them. The following cases are cited from the author's own experience. On one occasion everything rested on whether or not at the hour of the crime the latch of the door was oiled or made a noise; on another, whether a half-burnt cigar was in an ash tray or beside it; again, whether there was a spider's web near a nail in the wall; on another, whether there was still some kerosene in a lamp (*i.e.* whether it had been extinguished or had burnt itself out). In a murder case the assailant would certainly have gone undiscovered if the Investigating Officer had not thought of examining the top of a wooden partition about eight feet in height and not reaching to the ceiling. He saw that the top of the partition was covered with a thick coating of dust save in one place where the dust had been displaced, and naturally concluded that a man must have quite recently climbed over the partition at the spot. He made a search and discovered the accused among people living in the room separated from the scene of the crime by the partition in question.

159. CHRISTOPHER RUPPRECHT'S CASE. (ANSELM VON FEUERBACH. *Remarkable German Criminal Trials*. transl. Gordon. 1846. p. 112.)

In the year 1817 there lived in the town of M—— a goldsmith of the name of Christopher Rupprecht. He was between the ages of sixty and sixty-five, and in easy circumstances. He had been twelve years a widower, and had but one child living, a daughter, married to a furrier named Bieringer, a brother and two sisters. Rupprecht could neither read nor write and therefore kept no account either of his

trade or of the money he lent out at interest, but trusted entirely to his memory and to the assistance he occasionally received from others in arranging and drawing up his bills. He was a man of vulgar mind and coarse habits, fond of associating with people of the very lowest class, and of frequenting alehouses, where his chief delight was in slang and abuse, and where he suffered himself to be made the butt of the

roughest jokes and the most vulgar witticisms. His ruling passion was avarice and his favorite business the lending money at usurious interest. . . . For about a year he had been in the daily habit of frequenting a small beer shop, commonly called the Hell. . . . The party assembled there consisted of eleven respectable burghers, who sat talking and drinking together till about half past ten, when Rupprecht called for another glass of beer, and the host left the upper parlor where his guests were assembled, and went down into the tap to fetch it. As he was going upstairs with the beer, and had almost reached the top, he heard the bell over the street door, and on asking what was wanted, he was answered in a strange voice by the inquiry whether Mr. Rupprecht was there. Without looking round, the host answered that he was, and the stranger requested him to desire Rupprecht to step down to him for a moment. The host delivered the message to his guest, who instantly rose and left the room. Scarcely a minute had elapsed, when the other guests were alarmed by hearing loud groans like those of a person in a fit of apoplexy. They all hastened downstairs, and found Rupprecht lying just within the door, covered with blood which was pouring out of a large wound on his head. About a foot and a half from his body lay his cap, cut evidently by a sharp instrument. . . . The physician and surgeon attached to the Criminal Court was sent for, and found a wound four inches long, which had penetrated the skull. . . .

The Hell Tavern stands in the end of a narrow dark alley, from which there is no outlet. The side on which is the door forms an angle with the opposite house, so deep that no light falls into it by night. Two stone steps lead up to the house door, of which only one wing opens, and is provided with a bell. Outside the door, on the left of these

steps, is a stone bench. The hall within is small, narrow, and a little more than six feet high; the wound could not therefore have been inflicted upon Rupprecht in the hall, as space and height were required to give force to the blow. It would moreover have been madness to attempt the deed in a passage which was lighted by an oil lamp, which, though dim, would have enabled the victim or a passer-by to recognize the murderer. In the hall, too, Rupprecht coming down the stairs would have met his enemy face to face, and must have seen him prepare for the attack, from which he might easily have escaped by running to the rooms above. Supposing the wound — which slanted downward, and had evidently been inflicted from behind — to have been given during Rupprecht's flight up the stairs, those who ran down on hearing his screams would have found the wounded man on the staircase, or at any rate close to the foot of it. But he was found just within the house door after being wounded in endeavoring to escape up the stairs. Again, the wound was on the left side of the head, and the dark corner we have before mentioned is on the left hand of any one leaving the tavern. The probability therefore is that Rupprecht received the wound on the very doorstep. In this case he had but to totter one step back to fall on the spot where he was found. . . . It would have been scarcely possible for one in Rupprecht's condition to retain sufficient strength to crawl up the steps from the street into the hall. On the other hand, it would have been impossible for the murderer, standing in the street, to have struck Rupprecht from behind, while he stood on the doorsteps. This difficulty is, however, completely removed by the stone bench on the left of the door, which we have already mentioned.

Thus all circumstances combine to make us conclude that the occur-

rence took place as follows: As soon as the murderer had requested the landlord to send Rupprecht down to him, he went into the dark corner on the left, mounted the stone bench near the doorway, and stood there in readiness to strike. Rupprecht went downstairs, expecting

to find some one who wanted to speak to him on business, and seeing no one in the passage, went outside the door and turned to look down the street after the man who had sent for him, when he was struck a well-aimed heavy blow from the stone bench behind him. . . .

160. JOHN PAUL FORSTER'S CASE. (ANSELM VON FEUERBACH. *Remarkable German Criminal Trials.* transl. Gordon. 1846. p. 1.)

Christopher Baumler, a worthy citizen of Nürnberg, lived in the Königsstrasse, a wide and much-frequented street, where he carried on the trade of a corn chandler, which there includes the right of selling brandy. He had lately lost his wife, and lived quite alone, with only one maidservant, Anna Catharina Schultz. He had the reputation of being rich.

Baumler was in the habit of opening his shop at five o'clock in the morning at latest. But on the 21st of September, 1820, to the surprise of his neighbors, it remained closed until past six. Curiosity and alarm drew together a number of people before the house. They rang repeatedly, but no one came to the door. At last some neighbors, with the sanction of the police, entered the first-floor windows by a ladder. Here they found drawers, chests, and closets burst open, and presenting every appearance of a robbery having been committed. They hastened downstairs into the shop, where they discovered in a corner close to the street door the bloody corpse of the maid; and in the parlor they found Baumler lying dead beside the stove.

The house stands on the left hand in going along the Königsstrasse from the Frauen Thor, not far from the church of Saint Laurence. Several houses, chiefly inns and shops, flank it on either side; on the right, an inn called the Golden Lion stands out several feet beyond it. Close to this projecting wall is the door of Baumler's house, which is

entered by one low step; the hall serves as a shop, and the walls are lined with shelves, etc. The length of this hall from the street door to the opposite end, where a door opens into a court, is about sixteen feet; on the left, a staircase leads to the floor above. The breadth is unequal, for on the right hand near the door there is a corner about four feet wide and three feet deep, which forms part of the shop. On one side is the wall of Baumler's parlor; on the other, the main wall of the house towards the street, where a large bow window, always closed with shutters at night, admits the light into the shop, and thence into the parlor through a window opening into this corner. About seven feet from the entrance to the shop is the door of the small parlor, which is cut off from the street on all sides and furnished with tables and benches for the convenience of the customers for brandy. The house door, as is usually the case in shops of this kind in Nürnberg, is formed of two wings joined together, one of which folds back upon the other, and is fastened by a simple contrivance to the wall. During the day a glass door is fixed in the half of the doorway thus left open, which in the daytime serves to light the shop, and in the evening to show passers-by that the host is ready to receive customers. The door of Baumler's shop, behind the wing of which a man could perfectly conceal himself from any one entering, opens towards the left, exactly opposite to the corner we

have already described, so that any one coming in would turn his face towards the corner; and in the event of being attacked by a person hidden behind the door, would naturally run towards it. A bell hangs over the entrance which rings whenever either the glass or the wooden door is opened.

As soon as the police were informed of the murder, a commission was appointed to visit Baumler's house. Immediately on entering the shop, to the right of the door in the corner, between two bins of meal and salt, the maidservant Schultz lay on her back, with her head shattered, and her feet, from which both her shoes had fallen, turned towards the door. Her face and clothes, and the floor, were covered with blood; and the two bins between which her head lay, as well as the wall, were sprinkled with it. As no other part of the shop showed any marks of blood, it was evident that she had been murdered in this corner. Not far from the body they picked up a small comb, and at a little distance from that a larger one, with several fragments of a second small one. In the very farthest corner of the parlor, between the stove and a small table, upon which stood a jug, they found the body of Baumler stretched on his back, with his head, which was resting on a small overturned stool, covered with wounds and blood. A pipe and several small coins lay under the body, where they had probably fallen when the murderer ransacked the pocket (which was turned inside out and stained with blood) for money or for keys. The floor, the stove, and the wall were covered with blood, the stool was saturated, and even the vaulted ceiling, which was nine or ten feet high, was sprinkled with it. These circumstances, especially the stool on which Baumler's head still rested, and the pipe which lay under his body, showed that the murderer must have sud-

denly attacked him unawares and felled him to the earth, as he sat drinking his beer and smoking his pipe on that very spot.

One drawer of the commode in the upper chamber was pulled out, the doors of two cupboards in the adjoining room were open, and everything lay scattered about the floor. Several other presses, however, had not been opened, and many things of value, such as clothes, silver ornaments, a gold repeater, etc., were left in them, and even in those which had been opened. The rooms on the second story were found in their usual state. On the table, in the parlor, stood a wineglass with some red brandy at the bottom, and a closed clasp knife stained with blood on the back and sides.

Two newly baked rolls were found near the entrance door. The baker Stierhof stated that Baumler's maid had fetched these rolls from his shop the evening before, at about a quarter to ten. His wife, who was examined the next day on this point, recognized the rolls as those bought by the unfortunate maidservant on the evening of the 20th of September, adding, "The evening before last, at nearly a quarter to ten, the maid came to my house and asked for two half-penny rolls, which I gave her. I did not recognize her till she was going away, when I said, 'It is you, is it?' She answered sulkily, 'Yes.' I asked if they still had guests with them; and she said, 'Yes, there are a few fellows there still.' I then looked out of the window for a while: there was a deathlike silence in the street, so much so that I remarked it to my people. At a quarter to ten exactly I closed the shop." This evidence afforded a strong presumption that some person or persons who were still in Baumler's shop at a quarter to ten had committed this murder. Furthermore it was certain that the murder of the maidservant could not have taken place earlier than a quarter to ten;

the two rolls which she had fetched about that time from the Baker Stierhof, and which were found on the floor near the entrance, showed that the murderer had attacked her as she entered the shop on her return from the baker's, that she dropped the rolls in her fright, was driven into the corner of the shop, and there murdered. There could be no doubt that Baumler was murdered before the maidservant, for he was found beside the stool on which he usually sat smoking his pipe by the stove. Had he been alive when the murderer attacked his maid, he would have been alarmed by the noise, and have gone out into the shop; at any rate he would not have remained quietly seated for the murderer to dispatch him at his leisure. It was also evident that Baumler must have been murdered during the maid's absence. Now the distance from Baumler's house to the baker's shop is at most a hundred steps; thus, even supposing that Schultz, angry at being sent out so late, went very slowly, the walk there and back, including the short conversation with the baker's wife, could not have occupied above five minutes, and during this interval the murder of Baumler must have been completed, and that of Schultz prepared. This was proved by the following circumstance: As long as the glass door was there, the murderer could

neither attack Schultz on her entrance nor murder her within the threshold, as he could not possibly hide himself behind the glass door, which would moreover have exposed him to the risk of observation from every passer-by, and even to the chance of a stray guest of Baumler's entering the shop and surprising him in the act. It was therefore necessary to take the glass door off its hinges, and to shut the street-door, before attacking Schultz on her return to the house, — and this he accordingly did. Baumler's house was not usually closed until eleven, but on the night of the murder a Chandler of the name of Rossel, who lived opposite, happened to look out at a quarter to ten, and saw, to his surprise, that Baumler's house was then closed, — no doubt by the murderer. It was a quarter to ten when Schultz was at the baker's shop, at the same hour Rossel saw Baumler's house shut: we may therefore infer that the murderer killed Baumler soon after his maid's departure, quickly unhinged the glass door, lay in wait for the maid behind the street door, opened it for her, and attacked her as she came in; the concurring evidence of two witnesses thus distinctly proves that the murder of Baumler and his maid must have taken place during the few minutes before and after a quarter to ten.

161. **NEWTON'S CASE.** (W. WILLS. *Circumstantial Evidence*. Amer. ed. 1905. p. 148.)

A woman, Newton, who was tried for the murder of her mother, had lived for nine or ten years as housekeeper to an elderly gentleman, who was paralyzed and helpless; the only other inmate being another female servant, who slept on a sofa in his bedroom to attend upon him. The deceased occasionally visited her daughter at her master's house, and sometimes stopped all night, sleeping on a sofa in the kitchen.

She came to see her daughter about eight o'clock one night in December, 1848; the other servant retired to bed about half past nine, leaving the prisoner and her mother in the kitchen, and she afterwards heard the prisoner close the door at the foot of the stairs, which was usually left open that they might hear their master, if he wanted assistance. The prisoner usually slept upstairs. About two o'clock in the morning

the other servant was aroused by the smell of fire, and a sense of suffocation, and found the bedroom full of smoke; upon which she ran downstairs, finding the door at the bottom of the stairs still closed. As she went downstairs she saw a light in the yard, and she found the kitchen full of smoke, and very wet, particularly near the fireplace, as also was the sofa, but there was very little fire in the grate. She then unfastened the front door, and ran out to fetch her master's nephew, who lived near, and who hastened to the house. He found the front door fastened, but was admitted by the prisoner at the back door. He at once hastened upstairs, and ascertained that his uncle was safe, and then came down into the kitchen, where he found the sofa was on fire, and threw some water upon it. He then went to let the servant girl, who had fetched him, in at the front door, which he found bolted, and not merely latched. He then again went upstairs with the servant to his uncle's room, and they raised him up in bed, and saw that he was all right. On returning to the kitchen, they found the place was very wet; a little fire was still smoldering on the sofa, which they at once extinguished. The pillows and entire back part of the sofa cover were burnt to the breadth of a person's shoulders.

The prisoner then came in from the back premises in her night-dress; she was described as not drunk, but not quite sober. She took a bottle of rum from the cupboard, and drank from it, and after that she soon became thoroughly intoxicated, and lay down on the sofa. The girl then went out of the kitchen towards the brewhouse, and found the deceased lying on her face on the steps of the brewhouse, apparently burnt to death. Her arms were crossed in front over her breast, or, according to one witness, across her face; on the

back of the head lay a piece of the sofa cover, and near the body was a cotton bag which had been used in the house indiscriminately as a bag or a pillow; it was besmeared with oil. Near the feet of the body were the remains of four pairs of sheets which had been in the kitchen the night before. They were almost entirely consumed by fire; what was left of them was wet. The prisoner's clothes were on a chair in the kitchen — the explanation being given that she was in the habit of undressing there. Holes had been burnt through them, and it was found that the prisoner's hands were scorched and blistered, and that she had burns on her arms and body corresponding with the burns in her clothes. It appeared from the state of the bedclothes in her room upstairs that she had not been in bed, but there was a mark as if some one had been lying upon the bed. A butter boat, which had been full of dripping, and a pint bottle, which had been nearly full of lamp oil, and left near the fire overnight, were both empty, and there were spots of grease and oil on the pillow case, sheets, and sofa. A stocking had been hung up to cover a crevice in the window shutter, through which any person outside might have seen into the kitchen. The door post of the kitchen leading into the yard was much burnt about three feet high from the ground; and there was a mark of burning on the doorpost of the brewhouse. The surface of the deceased woman's body was completely charred, the tongue was livid and swollen, and one of the toes was much bruised, as if it had been trodden on. There was a small blister on the inner side of the right leg, far below where the great burning commenced, which contained straw-colored serum, but there was no other blister on any part of the body, nor any marks of redness around the blister, or at the parts where the injured and unin-

jured tissues joined. The nose, which had been a very prominent organ during life, was flattened down so as not to rise to more than the eighth of an inch above the level of the face, and as it never recovered its original appearance, it was stated that it must have been so flattened for some time before death. The lungs and brain were much congested, and a quantity of black blood was found in the right auricle of the heart.

From these facts the medical witnesses examined in support of the prosecution concluded, that the deceased had been first suffocated by pressing something over her mouth and nostrils so forcibly as to break and flatten the nose in the way described; but they had made no examination of the larynx and trachea, and other parts of the body. A physician who had heard the evidence but not seen the deceased, gave his opinion that the appearances described by the other witnesses were signs of death by suffocation; that the absence of vesication, and of the line of redness were certain signs that the body had been burnt after death; but he added that, as there were no marks of external injury, an examination should have been made of the parts of the body above mentioned, in order to arrive at a satisfactory conclusion. Another medical witness thought it possible that suffocation might have been produced by the flames preventing the access of air to the lungs, while others again thought it impossible that such could have been the case, as no screams had been heard in the night, and they were also of opinion that if alive, the deceased must have been in such intense agony that she could not, even if she had been strong enough to walk from the kitchen to the brewhouse, have refrained from screaming. One of these witnesses stated that he did not think it possible that the deceased, if alive, could have fallen in the posi-

tion in which she was found, as her first impulse would have been to stretch out her arms to prevent a fall; but, on the other hand, it was urged that it was not possible to judge of the acts of a person in the last agonies of death by the conduct of one in full life. Under the will of her grandfather the prisoner was entitled on the death of her mother to the sum of £200, and to the interest of the sum of £300 for her life. She had frequently cruelly beaten the old woman, threatened to shorten her days, bitterly reproaching her for keeping her out of her property by living so long, and declared that she should never be happy so long as she was above ground, and she had once attempted to choke her by forcing a handkerchief down her throat, but was prevented from doing so by the other servant. The magistrates had been frequently appealed to, but they could only remonstrate, as the old woman would not appear against her daughter.

The case set up on behalf of the prisoner was, that she was in bed and, perceiving a smell of fire, came downstairs, and finding the sofa on fire, fetched water and extinguished it, and that she knew nothing of her mother's death until she heard it from others. It appeared that the old woman was generally very chilly, and in the habit of getting near the fire; that on two former occasions she had burned portions of her dress; that on another she had burned the corner of the sofa cushion; that she used to smoke in bed, and light her pipe with lucifer matches, which she carried in a basket; and that on the night in question she had brought her pipe, which was found on the following morning in her basket. It was urged as the probable explanation of the position in which the body was found, that, finding herself on fire, she must have proceeded to the brewhouse, where she knew there was water, and leaned in her way

there against the doorpost, and that, feeling cold in the night, she had wrapped the sheets around her, and did not throw them off until she reached the yard. The prisoner, though accustomed to sleep upstairs, was in the habit of undressing in the kitchen, which was stated to be the reason why the stocking had been so placed as to prevent any person from seeing into the kitchen.

Mr. Justice PATTESON, in his

charge to the jury, characterized the evidence of the medical practitioners who had examined the body as extremely unsatisfactory in consequence of the incompleteness of their examination. The jury acquitted the prisoner; and indeed it would have been contrary to all principle to do otherwise, in the midst of so much uncertainty as to the *corpus delicti*.¹

162. ABRAHAM THORNTON'S CASE. (W. WOODALL. *Reports of Celebrated Trials*. 1873. Vol. I, p. 1.)

On the evening of the 26th of May, 1817, the deceased, Mary Ashford, accompanied by a friend of hers, Hannah Cox, went to a dance at a public house called Tyburn, not far from Erdington, a village a few miles distant from Birmingham. The prisoner Thornton was at the dance; and about half past eleven, or from that to twelve, he and the deceased left the house, and went together along the highroad in the direction in which Mary Ashford resided. They were left together on the highroad about midnight. From that time until three o'clock in the morning nothing was seen of them; but a little before three, a man named Umpage, on his way home, came across the prisoner, whom he knew, and a woman, whom he could not recognize, but who was, beyond all doubt, the deceased, at a stile leading into Bell Lane. Near this stile was a harrowed field, through which it was proved Thornton and Mary Ashford had been in the course of the night, and in which footsteps, undoubtedly those of the deceased and Thornton, were afterwards traced.² Nothing was seen of Thornton after this for some time; but Mary Ashford was traced to her friend's, Hannah Cox's, house

in Erdington, alone, where she changed her clothes. She left Cox's at about fourteen minutes past four in the morning, and went up to Bell Lane; and was last seen alive going in the direction of the harrowed field where the footsteps were found, at about eighteen minutes past four. She had then some way to go to the spot where her body was afterwards found in a pit of water; and in all probability she could not reach the pit until half past four at the earliest. Her body was discovered in the pit about half past six.

The theory of the prosecution was, that Thornton waylaid Mary Ashford on her way home from Cox's, and assaulted her: that she fainted; and that he then threw her body into the pit. In support of this it was sought to prove, from the footmarks in the field, that Thornton had chased, and had ultimately overtaken the deceased, and then violated her, not far from the pit. There was undoubtedly the impress of a human figure on the grass near the pit, and blood was traced from it, without any footmarks, close up to the edge of the pit. It was inferred from this that Thornton had carried Mary Ashford in his arms, and had then

¹ *Reg. v. Newton*, Shrewsbury Spring Assizes, 1850. Two former juries, at the Assizes in the preceding year, had been unable to agree, and had been discharged — a circumstance unparalleled, it is believed, in English jurisprudence.

² [A diagram of the locality is given with No. 63, *ante*, p. 160. — Ed.]

thrown her into the water. Allowing the least possible time for the commission of the crime, the deceased having been last seen alive at about eighteen minutes past four, it occurred in all probability not until a quarter to five. At half past four, however, the prisoner was indisputably proved to have been seen at a distance from the pit, in a straight line, of one mile and a half; but by the nearest road, of two miles and a quarter.¹ He was calm and did not seem as if he had been running. On being apprehended, he admitted being with the deceased until four in the morning, and that he had been intimate with her, but, as he asserted, with her consent. . . .

The trial took place before Mr. Justice HOLROYD on the 8th of August, 1817, at Warwick. . . .

Hannah Cox, examined by Mr. Sergeant *Copley*, said: "I lived in the service of Mr. Machell, of Erdington, in the month of May last. I slept at my mother-in-law's, Mrs. Butler, on the morning of the 27th; her house is nearly opposite to my master's. I was acquainted with Mary Ashford. . . . She called on me at Mr. Machell's about ten o'clock, on her road to Birmingham market. She had a bundle with her, and said she was going to Birmingham market. In the bundle were a clean frock, a white spencer, and a pair of white stockings. The deceased was dressed in pink cotton frock or gown, a straw bonnet with straw-colored ribbons, a scarlet spencer, half-boots, and black stockings. I went with her to Mrs. Butler's to leave the bundle. The deceased then went to Birmingham, having first agreed that she and I should go together that night to Daniel Clarke's, at Tyburn House, to a dance. The deceased returned about six o'clock in the evening, and called on me at Machell's. I went with her to Mrs. Butler's,

where she put on the clean dress she had left there in the morning, and a new pair of shoes, which I bought for her at a shoemaker's at Erdington in the course of the day. The clothes she pulled off she made up into a bundle and left at Butler's. We set off for Tyburn between seven and eight o'clock. The dance was at a public house there. . . . Mary Ashford was at the room door when I was going; she told me she would not be long before she would follow me. . . . Were you called up again any time in the course of the morning?—Yes.—Who called you up?—Mary Ashford.—You got up and let her in to your mother's house?—Yes.—Do you know what time it was; did you look at the clock?—Yes. . . . Was the deceased in the same dress then as she had on overnight?—Yes. . . .—The deceased did not go into another room to change her dress, did she; she remained in the house all the time and you stayed with her?—Yes.—What did the deceased do with the clothes she took off?—She tied them up in a bundle along with some market things; she wrapped the boots in a handkerchief, and kept on her shoes." . . .

William Lavell was the first of the witnesses who spoke to the footmarks. . . . "I went along the footpath to see if I could discover any footsteps. . . . At about eight yards distance I discovered a woman's footsteps going from the footpath in the same way to my right. . . . I afterwards went with a woman's shoe in company with Bird. It was Mary Ashford's shoe. I compared that shoe with the woman's steps I had traced, and with those that turned to the right and with those where the man and woman appeared to be running, and where the doubling was, in every place. The shoe corresponded. We took both shoes. I have no doubt in my mind that the woman's

¹ [See the testimony set forth *ante*, No. 63.]

steps all along were made by those shoes." . . .

This part of the evidence goes to show that shoes with which the footsteps were compared were those in which Mary Ashford had been to the dance, and in which she had been walking with Thornton for three hours, over or in the neighborhood of this identical field. At Hannah Cox's, it will be remembered, she changed everything except her shoes. If she had also changed her shoes, the whole face of this evidence against Thornton might have assumed a very different aspect. It is curious to think what the effect would have been if Mary Ashford had put on the shoes which she had left at Hannah Cox's in the evening on her return from

Birmingham, and in which she had not been to the ball. In that case, if the footsteps in the field were made by her in the shoes which she had changed at Hannah Cox's in the morning after the ball, they would have been conclusive evidence against Thornton. As however they were not, but were made by the shoes which she wore at and after the ball up to half past three, all which time she was voluntarily in Thornton's company, the value of the footsteps as evidence is much weakened. It is singular and unfortunate that the only article of dress, the change of which could have thrown any light on the question of the deceased's death, were those, which by some fatality or other, were not changed.

PART II: TESTIMONIAL EVIDENCE

INTRODUCTION

163. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹

The phrase "testimonial" evidence must not be understood as applicable exclusively to assertions made on the witness stand. Any assertion, taken as the basis of an inference to the existence of the matter asserted, is testimony, whether made in court or not (*ante*, No. 1). Thus, all the statements received under the exceptions to the hearsay rule are genuinely testimony. Assertions made on the witness stand are merely the commonest class of testimonial evidence. It follows that the considerations applicable to a witness are equally applicable in the use of extrajudicial assertions.

1. When a witness's statement is offered as the basis of an evidential inference to the truth of his statement, — for example, the statement of A that B struck X, — it is plain that at least three distinct elements are present; or, put in another way, that there are three stages to the process, in the absence of any one of which we cannot conceive of testimony. *First*, the witness must know something, *i.e.* must have observed the affray and received some impressions on the question whether B struck X; to this element may be given the generic term Perception. *Secondly*, the witness must have a recollection of these impressions, the result of his Perception; this may be termed Recollection, or Memory. *Thirdly*, he must communicate this recollection to the tribunal; that is, there must be Communication, or Narration, or Relation (for there is no single term entirely appropriate). Now the very notion of taking a human utterance as the basis of belief in the truth of the fact asserted impliedly attributes these three processes to the witness, — Perception, Recollection, Communication. Whatever principles, therefore, govern the belief in testimonial assertions must have reference to some one or more of these elements.

Moreover, in the function fulfilled by each of the three elements or processes are to be found in general form the fundamental canons for assigning to each its probative value. Thus, the notion of Perception is that the external event has in some way or other impressed itself on the witness's senses, to be now reproduced to us in court. This impression of the witness, then (knowledge, perception, or whatever it be called), should adequately represent or correspond to the fact itself as it really existed or exists; and the practical object is to secure the probability of a fairly accu-

¹[Adapted from the same author's *Treatise on Evidence*. . (1905. Vol. I, § 478.)]

rate perception on the part of the witness. Again, the function of Recollection is to recall or reproduce the original impressions of observation; and the fundamental basis of trust is that Recollection fairly corresponds with or reproduces the original Knowledge or Perception. Finally, the function of Narration (or, Communication) is to reproduce for the apprehension of the tribunal the Recollected results — themselves already reproduced from Observation; and the common aim in the varied problems under this head is to insure that the story as told shall represent with fair accuracy what the witness once observed and now recollects.

2. But this process of the individual witness's testimony is affected, not merely by his individual traits, but also by certain general traits, common to humanity, in which experience has enabled us to generalize. These generalizations affect traits common to large groups of individuals, or large classes of situations in which any individual may at times find himself. Hence the elements of trustworthiness in testimony may conveniently be studied under two separate heads:

- I. Generic Human Traits affecting the Testimonial Process in general;
- II. The Testimonial Process itself.

The principal generic traits may be taken up under the following heads: 1. Race; 2. Age; 3. Sex; 4. Mental Disease; 5. Moral Character; 6. Feeling, Emotion, and Bias; 7. Experience (acquired skill).

TITLE I: GENERIC HUMAN TRAITS AFFECTING THE TRUSTWORTHINESS OF TESTIMONY

SUBTITLE A: RACE

164. EDWARD WESTERMARCK. *Origin and Growth of Moral Ideas*. (1908. Vol. II, p. 72.) . . . Various uncivilized races are conspicuous for their great regard for truth; of some savages it is said that not even the most trying circumstances can induce them to tell a lie. Among others, again, falsehood is found to be a prevailing vice and the successful lie is a matter of popular admiration. . . .

"The genuine Wood-Wedda always speaks the truth; we never heard a lie from any of them; all their statements are short and true." A Veddah who had committed murder and was tried for it, instead of telling a lie in order to escape punishment, said simply nothing. Other instances of extreme truthfulness are provided by various uncivilized tribes in India. The Saoras of the province of Madras, "like most of the hill people, . . . are not inclined to lying. If one Saora kill another, he admits it at once and tells why he killed him." The highlander of Central India is described as "the most truthful of beings, and rarely denies either a money obligation or a crime really chargeable against him." A true Gond "will commit a murder, but he will not tell a lie." The Kandhs, says Macpherson, "are, I believe, inferior in veracity to no people in the world. . . . It is in all cases imperative to tell the truth, except when deception is necessary to save the life of a guest." . . . The Dyaks of Borneo are praised for their honesty and great regard for truth. Mr. Bock states that if they could not satisfactorily reply to his questions, they hesitated to answer at all, and that if he did not always get the whole truth, he always got at least nothing but the truth from them. Veracity is a characteristic of the Alfura of Halmahera and the Bataks of Sumatra, who only in cases of urgent necessity have recourse to a lie. The Javanese, says Crawford, "are honorably distinguished from all the civilized nations of Asia by a regard for truth." "In their intercourse with society," Raffles observes, "they display, in a high degree, the virtues of honesty, plain dealing, and candor. Their ingenuousness is such that, as the first Dutch authorities have acknowledged, prisoners brought to the bar on criminal charges, if really guilty, nine times out of ten confess, without disguise or equivocation, the full extent and exact circumstances of their offenses, and communicate, when required, more information on the matter at issue than all the rest of the evidence." . . . Castren states that the Zyrians, like the Finnish tribes generally, are trustworthy and honest, and that the Ostyaks have no other oaths but those of purgation.

Among them "witnesses never take the oath, but their words are unconditionally believed in, and everybody, with the exception of lunatics, is allowed to give evidence. Children may witness against their parents, brothers against brothers, a husband against his wife and a wife against her husband." The Aleuts were highly praised by Father Veniaminof for their truthfulness: "These people detest lying, and never spread false rumors. . . . They are very much offended if any one doubts their word." They "despise hypocrisy in every respect," and "do not flatter nor make empty promises, even in order to escape reproof."

The regard in which truth is held by the Eskimo seems to vary among different tribes. Armstrong blames the Western Eskimo for being much addicted to falsehood, and for seldom telling the truth, if there be anything to gain by a lie. . . . The Greenlanders are generally truthful towards each other, at least the men. But if he can help it, a Greenlander will not tell a truth which he thinks may be unpleasant to the hearer, as he is anxious to stand on as good a footing as possible with his fellow men. . . . Of the Australian aborigines we are told that some tribes and families display on nearly all occasions honesty and truthfulness, whereas others "seem almost destitute of the better qualities." . . .

Very different from these accounts is Mr. Gason's statement concerning the Dieyerie in South Australia. "A more treacherous race," he says, "I do not believe exists. They imbibe treachery in infancy, and practice it until death, and have no sense of wrong in it. . . . They seem to take a delight in lying, especially if they think it will please you. Should you ask them any question, be prepared for a falsehood, as a matter of course. They not only lie to the white man, but to each other, and do not appear to see any wrong in it." . . . We are told by Polack that among the Maoris of New Zealand lying is universally practiced by all classes, and that an accomplished liar is accounted a man of consummate ability. But Diefenbach found that, if treated with honesty, they were always ready to reciprocate such treatment; and, according to another authority, they believed in an evil spirit who they said was "a liar and the father of lies." The broad statement made by von Jhering, that among the South Sea Islanders lying is regarded as a harmless and innocent play of the imagination, is certainly not correct. . . . Nowhere in the savage world is truth held in less estimation than among many of the African races. . . . Miss Kingsley's experience of West African natives is likewise that they "will say 'Yes' to any mortal thing, if they think you want them to." The Wakamba are described as great liars. . . . To the Wanika, says Mr. New, lying is "almost as the very breath of their nostrils, and all classes, young and old, male and female, indulge in it. A great deal of their lying is without cause or object; it is lying for lying's sake. You ask a man his name, his tribe, where he lives, or any other simple question of like nature, and the answer he gives you will, as a rule, be the very opposite to the truth; yet he has nothing to evade or gain by so doing. Lying seems to be more natural to him than speaking the truth. He lies when detection is evident, and laughs at it as though he thought it a good joke. He hears himself called 'mulongo' (liar) a score of times a day, but he notices it not, for there is no opprobrium in the term to him. To hide a fault he lies with the most barefaced audacity and blindest obstinacy. . . . When his object is gain,

he will invent falsehoods wholesale. . . . He boasts that 'ulongo' (lying) is his 'pesa' (piece, ha'pence), and holds bare truth to be the most unprofitable commodity in the world. But while he lies causelessly, objectlessly, recklessly, in self-defense or self-interest, he is not a malicious liar. He does not lie with express intent to do others harm; this he would consider immoral, and he has sufficient goodness of heart to avoid indulging therein. . . . I have often been struck with the manner in which he has controlled his tongue when the character and interest of others have been at stake." . . .

But in Africa, also, there are many people who have been described as regardful of truth and hostile to falsehood. Early travelers speak very highly of the sincerity of the Hottentots. . . . As regards the truthfulness of the African Arabs opinions vary. Parkyns asks, "Who is more trustworthy than the desert Arab?" According to Rohlf's and Chavanne, on the other hand, the Arabs of the Sahara are much addicted to lying; and of the Arabs of Egypt Mr. St. John observes: "There is no general appreciation of a man's word. . . . 'Liar' is a playful appellative scarcely reproachful; and 'I have told a lie' a confession that may be made without a blush." . . . In Japan, Burma, and Siam truth is more respected than in China. "In love of truth," says Professor Rein, "the Japanese, so far as my experience goes, are not inferior to us Europeans." The Burmese, though partial to much exaggeration, are generally truthful. And "the mendacity so characteristic of Orientals is not a national defect among the Siamese. Lying, no doubt, is often resorted to as a protection against injustice and oppression, but the chances are greatly in favor of truth when evidence is sought." Lying has been called the national vice of the Hindus. "It is not too much to assert that the mass of Bengalis have no notion of truth and falsehood." . . .

Not without reason did the Romans of the republican age contrast their own "fides" with the mendacity of the Greeks and the perfidy of the Phœnicians. . . . The ancient Scandinavians considered it disgraceful for a man to tell a lie, to break a promise, or to commit a treacherous act. . . . "Speak every man truth with his neighbor," was from early times regarded as one of the most imperative of Christian maxims. . . .

Yet from early times we meet within the Christian Church a much less rigorous doctrine, which soon came to exercise a more powerful influence on the practice and feelings of men than did St. Augustine's uncompromising love of truth. . . . This zeal, together with an indiscriminate devotion to the Church, led to those "pious frauds," those innumerable falsifications of documents, inventions of legends, and forgeries of every description, which made the Catholic Church a veritable seat of lying, and most seriously impaired the sense of truth in the minds of Christians. . . . An oath which was contrary to the good of the Church was declared not to be binding. The theory was laid down that, as faith was not to be kept with a tyrant, pirate, or robber, who kills the body, it was still less to be kept with an heretic, who kills the soul. Private protestations were thought sufficient to relieve men in conscience from being bound by a solemn treaty or from the duty of speaking the truth; and an equivocation, or play upon words in which one sense is taken by the speaker and another sense intended by him for the hearer, was in some cases held permissible. . . .

Adherence to truth and especially perfect fidelity to a promise were strongly insisted upon by the code of Chivalry. . . . The knightly duty of sincerity seems to have gone little beyond the formal fulfillment of an engagement. "The age of Chivalry was an age of chicane, and fraud, and trickery, which were not least conspicuous among the knightly classes." . . . In modern times, according to Mr. Pike, the Public Records testify a decrease of deception in England. Commercial honesty has improved, and those mean arts to which, during the reigns of the Tudors, even men in the highest positions frequently had recourse, have now, at any rate, descended to a lower grade of society.

At present, in the civilized countries of the West, opinion as to what the duty of sincerity implies varies not only in different individuals, but among different classes or groups of people, as also among different nations.

165. G. F. ARNOLD. *Psychology Applied to Legal Evidence*. (1906. p. 435.) . . . There is a general danger, to which the psychologist is always alive, of misinterpreting other minds, and this is intensified when we are trying to understand one of another race. Professor Sully describes it as follows: "There is a characteristic danger in reading the minds of others which arises from an excessive propensity to project our own modes of thinking and feeling into them. This danger increases with the remoteness of the mind we are observing from our own. To apprehend, *e.g.* the sentiments and convictions of an ancient Roman, of a Hindu, or of an uncivilized African, is a very delicate operation. It implies close attention to the differences as well as the similarities of external manifestation, also an effort of imagination by which, though starting from some remembered experiences of our own, we feel our way into a new set of circumstances, new experiences, and a new set of mental habits. Children, again, owing to their remoteness from adults, are proverbially liable to be misunderstood."¹ A similar warning is given by Professor James: "The truth is that we are doomed, by the fact that we are practical beings with very limited tastes to attend to, and special ideas to look after, to be absolutely blind and insensible to the inner feelings and to the whole inner significance of lives that are different from our own. Our opinion of the worth of such lives is absolutely wide of the mark, and unfit to be counted at all."² It may probably be safely asserted that the difficulties of understanding others arise mainly from want of sympathy with them, and it is not possible to have such sympathy without some experience of pleasures and pains similar to theirs, or without the exercise of an imagination which must be based in part on such experience. Only thus can a man know what causes such feelings in them. Now it is specially difficult to enter into the feelings of others, when their conditions of life (internal or external) are very different from our own. Difference of language (as between Greeks and Barbarians), of color (as with Negroes), of rank and of faith, have afforded long and stubborn resistance to the growth of sympathy in the human race. . . .

It follows from this that the highly civilized European must be extremely careful when judging what it is probable a less civilized man of another race said or did; for what is improbable to him, because it conflicts with his knowledge and experience, would not be so to a person endowed with less knowl-

¹ Sully, *Outlines of Psychology*, p. 6.

² W. James, *Human Immortality*, p. 125.

edge and different experience, and courses of action, which to the European are manifestly inferior to others, will be those pursued by the more savage race because they will be the only courses to occur to their minds. . . .

A defect of Eastern races which particularly strikes the European mind is their want of veracity. It has always seemed to us that to so great an extent does this prejudice some Europeans against them that it renders them blind to many good qualities which these nations possess, an unfortunate result which has done much to keep the two races apart, for to a mind which does not value this single virtue at so high a rate such wholesale condemnation naturally appears most unjust. Yet, as the late Mr. Lecky points out, there is nothing so intrinsically great about veracity, in the sense in which we now employ the term, and it is only the force of circumstances which has led the Englishman to prize it so highly. "That accuracy of statement or fidelity to engagements which is commonly meant when we speak of a truthful man, is usually the special virtue of an industrial nation, for although industrial enterprise affords great temptations to deception, yet mutual confidence, and therefore strict truthfulness, are in these occupations so transcendently important that they acquire in the minds of men a value they had never before possessed. Veracity becomes the first virtue in the moral type, and no character is regarded with any kind of approbation in which it is wanting. It is made more than any other the test distinguishing a good from a bad man. . . . The usual characteristic of nations where the industrial spirit is wanting (*e.g.* the Italians, Spaniards, or Irish) is a certain laxity or instability of character, a proneness to exaggeration, a want of truthfulness in little things, an infidelity to engagements from which an Englishman, educated in the habits of industrial life, readily infers a complete absence of moral principle. But a larger philosophy and a deeper experience dispel his error. He finds that where the industrial spirit has not penetrated, truthfulness rarely occupies in the popular mind the same prominent position in the catalogue of virtues. It is not reckoned among the fundamentals of morality; and it is possible and even common to find in these nations — what would be scarcely possible in an industrial society — men who are habitually dishonest and untruthful in small things, and whose lives are nevertheless influenced by a deep religious feeling, and adorned by the consistent practice of some of the most difficult and painful virtues. Trust in Providence, content and resignation in extreme poverty and suffering, the most genuine amiability and the most sincere readiness to assist their brethren, an adherence to their religious opinions which no persecutions and no bribes can shake, a capacity for heroic, transcendent, and prolonged self-sacrifice, may be found in some nations in men who are habitual liars and habitual cheats." ¹

We have reproduced this somewhat lengthy quotation because so much of it appears to us to apply to Eastern races, especially to the Burmese people, and because it not only appears to explain the want of veracity among them, but also at the same time to correctly estimate the whole character of such a people.

166. F. W. COLEGROVE. *Memory, an Inductive Study*. (1900. p. 246.) The Indians who sent returns represent 25 different tribes, and may be con-

¹ E. H. Lecky, *History of European Morals*, Vol. I, pp. 137 *et seq.*

sidered fairly representative. Some of the tribes are in a low state of civilization, but many came from families of wealth and culture. Many of these memories may be termed crystalized racial experiences, and the question arises whether the memory tone is not modified by atavistic tendencies. As will be seen later, their memories for pleasant and unpleasant occurrences savor of racial experiences. The curves for the first three memories of both males and females average higher than those of the whites.

Comparing the Indian males with the white males of the same period, the Indians show a higher percentage of memories for hearing, taste, mother and playmates, crying and grief, corporal punishment, trees, quarrels, and almost double for domestic fowls and animals. They have a higher percentage of tactile memories, and a smaller percentage for dress and persons not relatives. The following memories are wholly or chiefly Indian: fishing, snakes, squirrels, negroes, hunting (bow and arrows), lakes and streams, and tobacco.

Comparing Indian females with white females of the same age, the Indians have a larger percentage of auditory, gustatory, and motor memories, also for father, mother, playmates, fear, and dolls; much greater for crying and grief, and double the percentage for domestic fowls and animals. They have a smaller percentage of memories for persons not related, dresses and other clothing, fewer typographical and logical memories, and less for sickness and accident to self and others, and for the activity of others. The following memories belong wholly or chiefly to the Indians: lakes, rivers, wolves, coons, owls, fishing, skating, and negroes.

The curves for the age of the negroes at the time of the first three memories show a higher average than those for the whites. The negroes do not seem to differentiate the memories from the memory complex until late in life. This may be due to the poverty of the mental experience in early life. The memory tone is monotonous. Further evidence of this is a strong tendency to remember by comparison. Such an event occurred "in Garfield's" or "in Harrison's administration," or "after I went to school." But the best-educated negroes, as would be expected, have sharply defined and well differentiated early experiences. Their memories, too, have less of the grotesque character. The story of hardships, wrong, and suffering is deeply imprinted on many memories. . . .

The pleasant and unpleasant memories of the male whites rise and fall together until the age of 21. At 22, in the case of the males, the curve for unpleasant memories is the higher, after which the pleasant memories are in the ascendancy. After the age of 30, unpleasant memories are little recalled by the males. The unpleasant memories play the important rôle in the case of the Indian and negro males. One can hardly fail to see in it a suggestion of persecution and slavery. The Indian females show a slight tendency toward remembering unpleasant experiences best, and share the sorrowful experiences of their brothers. On the other hand, in the case of the negro females, unpleasant experiences play a very minor part indeed. With them a dress of striking color appears easily to efface grief.

167. M. D. CHALMERS. *Petty Perjury*. (1895. *Law Quarterly Review*. Vol. XI, p. 219.) . . . Though most of the perjury committed in county courts and police courts is of a petty nature, still in the aggregate it constitutes a serious impediment to the administration of justice. . . . Few people,

I think, realize the extent to which perjury is prevalent among the lower classes in England. I happen to have administered justice in three different countries, namely, England, Gibraltar, and India, so perhaps I have some basis of comparison. In Gibraltar there was a mixed population of Spaniards, Maltese, and Barbary Jews, but there was nothing to complain of in the way of perjury. In India, no doubt, there was a good deal of lying, but many of the lies were of a stereotyped form (like fictitious averments in pleading), and I certainly think it is harder to get at the truth in an English county court than it was in a northwest cutcherry. In the High Court a higher grade of witnesses is reached, and perjury is comparatively rare. Moreover, a witness who will freely commit a perjury in a money matter will hesitate to do so in a criminal cause. Wales has not a high reputation for truth-telling, but if I may judge from a single circuit, the Welshmen are no worse than their neighbors. With one exception, I was struck with the careful honesty of the witnesses all round the circuit. . . . Some time ago I took a note of a hundred consecutive cases for less than £20 tried before me at Birmingham. I found there was hard cross-swearing in sixty-three. Of course there is much hard swearing which is not perjury. . . . My county-court experience is mainly confined to Birmingham, but I have no reason to believe, and I do not believe, that Birmingham is worse than other large urban courts. If that be so, after making all allowance for hard swearing which is not perjury, there remains a terrible residuum of willful and corrupt perjury, which urgently calls for a remedy, if the administration of justice is not to be reduced to a farce.

168. MINNIE MOORE-WILLSON. *The Seminoles of Florida*. (1910. p. 93.)
 . . . *The Seminole's Unwritten Verdict of the White Race*.

"Es-ta-had-kee, ho-lo-wa-gus, lox-ee-o-jus"
 (White man no good, lie too much.)

In some mysterious way, the Seminole's conception of the Decalogue neither to lie, nor steal, nor cheat, is the foundation stone upon which he builds his character, principle, and honor; for it is taught to the race, from the cradle to the grave, to the swinging papoose on its mother's shoulders, all through life, till the Great Spirit calls to the Happy Hunting Grounds. Let the reader stop and consider that here is a community of hundreds, living in open palmetto camps. No locks, no doors, no courts, and no officers to keep the law; a people, who for generations have lived, pure in morals, with no thieving, no trespassing, and no profanity (for the Seminole has no oath in his language). . . . With the Seminole's power to condense into a single phrase, he crystallizes his verdict of the white man into the above forcible expression. In pathetic but terse language, it tells of generations of wrong treatment at the hands of the white brother; sharp practices and broken treaties and misrepresentations are all included in the general summing up. From his oral lexicon, he has chosen these few words, which reveal the throbbing inner soul of these red children of the forests. . . . With a stoicism born of generations of training, the Seminole shows no ill will, no resentment, and the harshest criticism he ever makes against his white conquerors and victorious brothers is this phrase, "Es-ta-had-kee, ho-lo-wag-us, lox-ee-o-jus." And whether in vindication of some offense, or given as a simple opinion, his pent-up feelings find expression in this one forcible epithet, and

seems to be the missile he hurls at the white man. The average American, with his standard of morals calloused by dealings in the business and social world, smiles at the Seminole's verdict of his character, and with indifferent shrug jocularly repeats it as being only — the opinion of an Indian.

169. **SHELP v. UNITED STATES.** (1897. FEDERAL CIRCUIT COURT OF APPEALS. 81 Fed. 694.) . . .

HAWLEY, District Judge. This appeal is taken from a judgment of the District Court of Alaska, upon the conviction of the plaintiffs in error (hereinafter designated as "defendants") of the crime of unlawfully selling intoxicating liquor. . . . The next error assigned is that the Court erred in its charge to the jury. In order to fully understand the parts of the charge objected to, it is essential to state briefly the general character of the testimony at the trial.

One Indian witness, on behalf of the government, testified as follows: "My name is Dennis. I live at Chilkoot. . . . I know these defendants. . . . Their boat was anchored off the shore. The younger man (meaning the defendant Cleveland) waved his hat to me; picked up a keg; then drank out of a tin cup. When I came to their boat, they gave me whisky to drink, and told me to tell the other people at the village that they had plenty of whisky. I went and told at the village, and 12 of us came down in a canoe, and got whisky from the white men. I got two bottles and paid four (\$4) for it." Several other Indians testified substantially to the same effect. The defendants testified that they resided at Douglas; that on the 12th of August, 1894, they started on a prospecting expedition in a sloop; that they went to Bear Creek, on Douglas Island; that they left there, and arrived at Funter Bay, on Admiralty Island, August 16th, and left on the 17th, and arrived at Bartlett Bay on the 18th; left there on the 19th, and arrived at Hoona Sound on the 20th; and stayed there, prospecting

around the sound, for 8 or 10 days. The defendant Shelp, in the course of his testimony, said: "I was never at Chilkoot in my life. I never saw, to my knowledge, any of the Indians who testified in this case. We had no whisky on board of our sloop; neither sold nor gave away any whisky to Indians."

It is also necessary to consider what was said by defendants' counsel in the argument to the jury, for it is evident that some of the sentences objected to in the charge were given by the Court in reply thereto. In discussing the weight to be given to the evidence by the jury, one of the defendants' attorneys said: "That the evidence of ignorant, half-civilized barbarians, whose moral and religious sense was not developed, and who did not understand and appreciate the binding force of an oath as understood by Christian people, and who had little or no appreciation of our religious ideas, from which the oath gets its binding force and efficacy, and who had no appreciation of the enormity of perjury, — that the evidence of such witnesses was not entitled to as much credit as the evidence of a witness whose moral ideas were more fully developed, and who understood the binding nature of an oath, and the pains and penalties of perjury." The Court, after referring to the remarks of counsel, charged the jury as follows: "(1) It is a fact that Indians lie, and it is also a fact that white men lie, and some of the most civilized and cultured men are among the greatest liars. The evidence of Indian witnesses is entitled to as much credit and weight as the evidence of white men, and such

Only one witness, a Chinese person born in China, an alleged uncle of the defendants, gave testimony. He says: "Am 36 years

Have been in the United States 23 years. Came from China with my brother and sister-in-law (brother's wife, presumably), and at San Francisco, and remained there ten years, at 503 Dupont street," and while there the defendants were born, and are the sons of the witness. It is to conjecture whether or not they are the children of the brother who came over with him; whether or not the sister-in-law who came with him at that time is the mother. That at the end of the ten years he returned to China, and his brother, sister-in-law, and the defendants remained with him. Witness remained in China one year, then returned to the United States, landed at San Francisco, where he remained five days, when he came on to New York, where he remained ten days, and then went to Brooklyn, where he remained eight years, and then returned again to China, and remained one year. States that he saw the defendants there daily during that year. The witness then returned to Brooklyn, and has resided at 457 Central avenue, Brooklyn. Says the boys, Ho Fong Sing and Ho Lee Duck, identifying the defendants in court, are the same persons who were born in Dupont street, San Francisco, California, and the same he saw in China, as stated. On cross-examination, says he lived at Ho Uk with his father and this brother before he first came to the United States, and attended school two years. The brother married Wong She, who lived at Wong Uk, two thirds of a mile from his father's home, but witness does not know whether she had any brothers or sisters. In China he knew Ho Sew, Ho Lew, and Ho Fat, aged 14, 12, and 13 years, respectively, but remembers no other persons he knew in China. He gives the day, hour, and minutes of his leaving home, arrival in Hong Kong (except the day and minute), and arrival in San Francisco (ex-

cept minutes). He then says he and this brother (alleged father of defendants) ran a store at Dupont street those ten years, and that he (the witness) had \$300 in the firm, which he borrowed from a friend, Ho Kong, who came with him from China to the United States. He had failed to recall the existence of this financial friend and backer of his childhood when asked to give the name of persons he knew in China. He names the firm of Hop Lung, on Dupont street, but forgets the address, and cannot remember the name of any other firm or the location of any firm in Dupont street, except his own. Says he seldom went out, and does not know or remember the streets running parallel with, or those crossing, Dupont street, although he was doing business in the store No. 503 Dupont street, buying and selling goods and cooking, all the time while he grew from 13 to 23 years of age. Does not remember the particulars of his arrival in New York and Brooklyn. He does not state, and no one asked, the ages of the defendants, or as to any of the circumstances of their birth or life in San Francisco.

All this evidence amounts to is that the defendants enter the United States from Canada and are arrested. A Chinese person from Brooklyn, whose general character is not impeached or questioned, claims to be their uncle, and says they were born in Dupont street, San Francisco, California, at some time during the ten years following the coming of their parents to the United States, and went with their parents to China, where they were seen by this uncle every day for a year on a visit he made to his native land eight years later. This witness exhibited such a vivid, special, and remarkable memory as to some things, and such an absolutely blank memory as to others he would naturally observe and remember, that the commissioner doubted his truth and

person. Such a rule would make most witnesses in a court of justice interested witnesses, and, if interest alone justifies the court in refusing credence to the testimony of a witness, then many in every trial would be more or less discredited by reason of mere national kinship, and the court or jury, as the case might be, would be at liberty to refuse to be bound by their testimony when testifying in favor of a party of their own nationality. There is no rule of law that justifies the assumption that a Chinese person is more interested in his countrymen than is a person of some other nationality in his. A Yankee may testify for a Yankee, but he is not therefore interested. An Irishman may testify for an Irishman, an Englishman for an Englishman, a German for a German; but such witnesses are not, in the eye of the law, interested. No discredit can legally attach to the testimony of a person because he gives his evidence in behalf of a party who belongs to his own nationality. A Chinese witness in one of these cases, if engaged in securing the entrance of Chinese persons into the United States, is open to suspicion; and if he is engaged in aiding the entrance of such a person, and gives evidence in that behalf, he is interested, and such fact tends to legitimately discredit his testimony. We are all brothers in the family of Adam, — all brothers in the national family to which by birth or adoption we belong, — but these ties of race or color do not make us interested witnesses when we testify in court, within the rule that permits interest to be used as a discrediting circumstance. If it affirmatively appears that a witness has a bias in favor of persons of his own nationality, in whose behalf he is testifying, or against the other party to the litigation, or a bias in favor of persons of his own nationality generally, or against those of another nationality, such fact may be used to discredit his testimony. Such

facts may be considered by the court and jury, but we cannot assume or presume the existence of such a bias either in favor of persons of the same nationality, or against persons of another nationality. The one assumption is as unjust and ill-founded as the other.

It is quite true, however, that the testimony of foreigners and of others who are brought from a distance to the place of trial requires to be scrutinized with more than common caution. The tribunal before which they speak knows little of them, and they care little for it, and may have no respect for the laws of the country in which they are giving evidence. They have little to fear from having their falsehoods exposed, as there is little danger of conviction for perjury, and they lose nothing in reputation among their fellows. In our courts a witness who does not understand or who cannot speak our language, but who speaks through an interpreter, if at all, has the time and opportunity to prepare his answers to each question with care, and hence the force of a cross-examination is broken, if not destroyed.

So, too, it is common knowledge that enslaved peoples develop an inordinate propensity for lying, and this is characteristic of most oriental nations. This comes largely from their being subject to the caprice and exactions of their masters or superiors, and, having no sense of moral responsibility to them, they come to regard lying to them as no sin, and an habitual disregard of the truth is thus engendered. . . . Hence in all these Chinese exclusion cases the testimony of Chinese witnesses, unknown and coming from a distance, — especially that of foreigners, — may be regarded as more or less weak; and, when contradicted or really impeached in any of the modes suggested and recognized by our law, the commissioner is justified in regarding such testimony, standing alone, as insufficient to convince

the judicial mind. This conclusion must not be reached arbitrarily or capriciously or from prejudice, but from conviction that the case is not made out; and in such cases the appellate court or judge is not justified in reversing the finding of the tribunal which had the opportunity of observing the witness, and noting his manner and sincerity or

want of sincerity in giving testimony. . . .

A full and careful examination and consideration of all of the evidence in each of the cases now before the court fails to disclose any ground of reversal in either case, and hence the judgments of deportation must be affirmed.

171. **THE GENERAL RUCKER.** (1888. FEDERAL DISTRICT COURT, TENNESSEE. 35 Fed. 152.)

. . . In Admiralty. Libel in personam demanding \$2500 damages for personal injuries to the libelant, caused by a blow on the head with a monkey-wrench in the hand of the mate while both were engaged in loading machinery from a barge alongside of the steamboat *General Rucker*, of which the defendant was the owner. The facts are stated in the opinion of the Court.

J. S. Duval and *J. M. Greer*, for libelant. *Poston & Poston*, for defendant.

HAMMOND, J. — The disputed issue of fact in this case must be decided for the libelant, unless it is to be taken as a rule of evidence that the testimony of a white man shall prevail, "per fas et nefas," over that of a negro; which can never be tolerated in any intelligent and impartial tribunal for the trial of such issues, whether by judge or jury, either avowedly or covertly, by the invention of some pretense to disguise the operation of pure prejudice on that subject. In what was said about this matter at the bar, the learned counsel for the defendant justly and somewhat indignantly repudiated any reliance upon such a prejudice, but insisted that the difference between witnesses in intelligence, moral stamina, and like elements of substantial character entering into the problem of decision, should turn the scale in any event, whether that difference arises from race distinctions or other causes; and there can be no doubt of the

justice of that rule, as he states it. But; like all other considerations of that kind, in the application of the principle, there must be a careful scrutiny into all the circumstances, so that there shall be no unjust exaggeration of it into one of mere aversion against the testimony of the witness on account of his race.

The mate swears positively that he did not strike the libelant at all, and, if they were both white or both black, the burden being on the libelant, he would necessarily fail, if that were all the proof, and each were equally with the other entitled to credit. But the corroborating circumstances certainly proved are with the libelant. First, his wounded skull, exhibited immediately after the occurrence, with a persistent statement that the wound was made in the manner he now states it to have been, corroborates his story. There is not the faintest suggestion in the proof to account for that wound in any other way except the reluctant and very evasive answers of the mate, on cross-examination, that he might have struck him with the stick which he admits he threw at the gang of roustabouts at work on the vessel. But another one of them it was he struck on that occasion, and he was arrested at the time on the affidavit of that other. The counsel here suggests that the wound may have been made by contact with the sides of the vessel or barge as the libelant fell into the river between them, or by some con-

tact like that in falling. Certainly, it may have been, but nothing then occurring in relation to that circumstance suggests that as a cause of the wound. The libelant's witnesses swear that he then and there vociferously accused the mate of striking him with the monkey-wrench, and knocking him into the river, and that the mate suppressed his complaints by compelling him to return to work, with threats of shooting him. The mate denies this, as he does the striking, and his witnesses did not hear it, some of them saying they saw no wounds or blood on the face; but two of his witnesses, most favorably situated to see what occurred, did see the wound and blood. One of these, Pat Sheridan, heard no remark about the wound, being evidently attentive to his duty as engineer of the "nigger engine," with which the machinery was being lifted from the barge to the vessel, and possibly too far away to hear everything that was said; but the other, Bradford, another mate, whom all agree was right at hand, not only saw the wound and blood on the face, but also heard libelant accuse the mate of striking him and knocking him into the river. He says the mate denied it, and that he remarked that libelant might have got the hurt in falling, but that he continued to accuse the mate of having struck him, which corroborates the libelant's witnesses on that point. . . .

Again, the conduct of the libelant, and others who were struck, of going to the magistrate that night and swearing out warrants for the mate's arrest, corroborates libelant. Of course it is possible that this negro man of inferior intelligence conceived the idea, as did the other two, of taking advantage of the circumstance that in falling he had cut his head, to wholly fabricate a story of being beaten, and of all three going before a justice of the peace, and each falsely complaining of an assault and beating by this mate;

also that he would set up such a charge in order to bring this suit for damages. But that theory of accounting for their conduct is improbable; for it was well said by the learned counsel of libelant that these simple-minded negroes are scarcely equal to such a scheme as that. Under the explanation given by Capt. Sims, the defendant, for settling those prosecutions and paying the costs, that circumstance cannot be taken as corroborative of libelant's testimony; but the mere fact of an immediate accusation before the officers of the law is, considering the simplicity of the negro character, taken in connection with his then bleeding wound, and the complaints of the others of a beating at the same time, strongly suggestive of the fact that this mate was pursuing the usual method — to which they are nearly all addicted, and which they dislike to give up — of enforcing obedience to his orders by physical force. Under these circumstances it is more probable that he struck this man than that he did not, notwithstanding that he denies doing it and that he is a white man and the other a negro.

But, besides this, we have the positive testimony of libelant's witnesses that they saw the blow struck, and the story they tell is reasonable enough, after making allowance for their exaggerations of the enormity of the mate's conduct. Their belief that the mate intentionally knocked libelant into the river is probably not at all true, and they no doubt magnify the force of the blow, and all their impressions of the occurrences are crude and distorted, perhaps; and yet out of it all the real facts are easily discernible. It is fairly to be inferred that, substantially, the facts are that the mates were engaged in driving the hands to the speedy work necessary to enable the boat to leave that evening, and trying to keep them up to the mark of efficiency necessary to accomplish that purpose; and that, in reply to

libelant's suggestion that they were green hands at the business, he tapped him on the head with the monkey-wrench, or some like instrument, severely enough to make an ugly wound, which turned out to be not very serious, and that the libelant, in his haste to get away and escape further blows, or to get about his work, fell between the vessel and the barge from which the machinery was being transferred and into the river, from which danger the mate promptly rescued him, and saved his life.

Turning now to the defendant's proof, I find nothing in it necessarily overcoming the circumstances tending to establish the above conclusion of fact. Of course, there is the denial of the mate; but that has already been treated, and the other proof must prevail against it. Nothing in the proof of the other witnesses establishes his denial or necessarily tends to support it. Every one of them testifies, to be sure, that he did not see the blow, and some of them think they would have seen it if there had been one struck; but it is manifest from the nature of the act and the situation of each, as described by himself, that the blow could have been struck and not one of them have seen it. It is a kind of negative testimony of not much value. . . . The libelant says that the other mate, the witness Bradford, stood by and saw the blow, and no doubt he was close enough to have seen it; but that witness was himself engaged in the business of hurrying up the work by superintending it, and, notwithstanding his proximity, may not have seen the blow. He is very positive none was struck; but he did not belong to the "gang" of workmen and was not, like them, at that moment subjected to the immediate supervision of the mate and brought into direct contact with him. . . .

Now, there can be no question whatever that if we rigidly confine the libelant to the minutiae of his

story and that of the witnesses, and demand that every detail of it shall be precisely consistent with the ascertained fact before any corroboration shall be established by those facts, it would fail. So would the story of the mate and his witnesses fail under such a process. But it is an unreasonable requirement, and the law of evidence does not demand such consistency of detail in the relation of occurrences of that nature. The truth is that no two witnesses on such occasions quite agree as to the details of an occurrence, and no single witness can tell with absolute precision what took place and describe accurately all the details. The most that any trier of the issue can do is to extract from the consistencies and the inconsistencies of statements the truth as nearly as it may be. That the blow was struck in this case will always remain, argumentatively, perhaps, a matter of doubt; but for the practical purposes of judicial judgment it must be taken as an established fact.

Perhaps I should refer to the attack on the libelant for his false statement that he remained at home six weeks, when the proof shows that in less than ten days he worked a week in Memphis. If this be material, it may be said that it is doubtful if negroes of this class can ever be accurate as to time and its relation to events. It is notorious that the most intelligent witnesses find difficulty in estimating time, and generally say, "four or five weeks," and "five or six days," etc., in measuring it; but negroes seem to be most unreliable in this respect, almost always. The libelant doubtless thought to exaggerate his sufferings by making the time longer, but it is hardly fair, under the circumstances already stated, to disbelieve him on that account as to the blow. Moreover, he may well reply "tu quoque"; for this mate swore positively that he paid the libelant that night before he left the boat, while the truth

is that he escaped from the boat with the other negroes, and went to the magistrate's office, and returned next day for his pay, slipping on board to avoid the mate, whom he was evidently afraid to meet. It is not quite satisfactory to argue that the one statement is material and the other immaterial to the issue. The mate's statement, if true, would have been quite as strong as a corroborating circum-

stance of his story as the libelant's would have been a material aggravation of his damages.

So much attention to a dispute about a mere matter of fact is necessary, under the circumstances, to avoid any misunderstanding or misrepresentation as to the grounds of this judgment. . . . The libelant will be allowed \$100 damages, and his costs of suit. So ordered.

SUB-TITLE B: AGE

172. ROBERT LOUIS STEVENSON. *Virginibus Puerisque*. Essay on *Child's Play*. The regret we have for our childhood is not wholly justifiable: so much a man may lay down without fear of public ribaldry; for although we shake our heads over the change, we are not unconscious of the manifold advantages of our new state. What we lose in generous impulse, we more than gain in the habit of generously watching others; and the capacity to enjoy Shakespeare may balance a lost aptitude for playing at soldiers. Terror is gone out of our lives, moreover; we no longer see the devil in the bed-curtains nor lie awake to listen to the wind. We go to school no more; and if we have only exchanged one drudgery for another (which is by no means sure), we are set free forever from the daily fear of chastisement.

And yet a great change has overtaken us; and although we do not enjoy ourselves less, at least we take our pleasure differently. We need pickles nowadays to make Wednesday's cold mutton please our Friday's appetite; and I can remember the time when to call it red venison, and tell myself a hunter's story, would have made it more palatable than the best of sauces. To the grown person, cold mutton is cold mutton all the world over; not all the mythology ever invented by man will make it better or worse to him; the broad fact, the clamant reality, of the mutton carries away before it such seductive figments. But for the child it is still possible to weave an enchantment over eatables; and if he has but read of a dish in a story book, it will be heavenly manna to him for a week. . . . Children may be pure spirits, if they will, and take their enjoyment in a world of moonshine. Sensation does not count for so much in our first years as afterwards; something of the swaddling numbness of infancy clings about us; we see and touch and hear through a sort of golden mist. Children, for instance, are able enough to see, but they have no great faculty for looking; they do not use their eyes for the pleasure of using them, but for by-ends of their own; and the things I call to mind seeing most vividly were not beautiful in themselves, but merely interesting or enviable to me as I thought they might be turned to practical account in play. Nor is the sense of touch so clean and poignant in children as it is in a man. If you will turn over your old memories, I think the sensations of this sort you remember will be somewhat vague, and

come to not much more than a blunt, general sense of heat on summer days, or a blunt, general sense of well-being in bed. . . . As for taste, when we bear in mind the excesses of unmitigated sugar which delight a youthful palate, it is surely no very cynical asperity to think taste a character of the maturer growth. Smell and hearing are perhaps more developed ; I remember many scents, many voices, and a great deal of spring singing in the woods. But hearing is capable of vast improvement as a means of pleasure ; and there is all the world between gaping wonderment at the jargon of birds, and the emotion with which a man listens to articulate music.

At the same time, and step by step, with this increase in the definition and intensity of what we feel which accompanies our growing age, another change takes place in the sphere of intellect, by which all things are transformed and seen through theories and associations as through colored windows. We make to ourselves day by day, out of history, and gossip, and economical speculations, and God knows what, a medium in which we walk and through which we look abroad. We study shop windows with other eyes than in our childhood, never to wonder, not always to admire, but to make and modify our little incongruous theories about life. . . . According to my contention, this is a flight to which children cannot rise. . . . We grown people can tell ourselves a story, give and take strokes until the bucklers ring, ride far and fast, marry, fall, and die ; all the while sitting quietly by the fire or lying prone in bed. This is exactly what a child cannot do, or does not do, at least, when he can find anything else. He works all with lay figures and stage properties. When his story comes to the fighting, he must rise, get something by way of a sword and have a set-to with a piece of furniture, until he is out of breath. When he comes to ride with the king's pardon, he must bestride a chair, which he will so hurry and belabor and on which he will furiously demean himself, that the messenger will arrive, if not bloody with spurring, at least fiery red with haste. If his romance involves an accident upon a cliff, he must clamor in person about the chest of drawers and fall bodily upon the carpet, before his imagination is satisfied. Lead soldiers, dolls, all toys, in short, are in the same category and answer the same end. Nothing can stagger a child's faith ; he accepts the clumsiest substitutes and can swallow the most staring incongruities. The chair he has just been besieging as a castle, or valiantly cutting to the ground as a dragon, is taken away for the accommodation of a morning visitor, and he is nothing abashed ; he can skirmish by the hour with a stationary coal scuttle ; in the midst of the enchanted pleasance, he can see, without sensible shock, the gardener soberly digging potatoes for the day's dinner. He can make abstraction of whatever does not fit into his fable ; and he puts his eyes into his pocket, just as we hold our noses in an unsavory lane. . . .

In the child's world of dim sensation, play is all in all. "Making believe" is the gist of his whole life, and he cannot so much as take a walk except in character. I could not learn my alphabet without some suitable "mise-en-scène," and had to act a business man in an office before I could sit down to my book. Will you kindly question your memory, and find out how much you did, work or pleasure, in good faith and soberness, and for how much you had to cheat yourself with some invention ? I remember, as though it were yesterday, the expansion of spirit, the dignity and self-reliance, that came with a pair of mustachios in burnt cork, even when there was none to see.

Children are even too content to forego what we call the realities, and prefer the shadow to the substance. When they might be speaking intelligibly together, they chatter senseless gibberish by the hour, and are quite happy because they are making believe to speak French. I have said already how even the imperious appetite of hunger suffers itself to be gulled and led by the nose with the fag end of an old song. . . . When my cousin and I took our porridge of a morning, we had a device to enliven the course of the meal. He ate his with sugar, and explained it to be a country continually buried under snow. I took mine with milk, and explained it to be a country suffering gradual inundation. You can imagine us exchanging bulletins; how here was an island still unsubmerged, here a valley not yet covered with snow; what inventions were made; how his population lived in chains on perches and traveled on stilts, and how mine was always in boats; how the interest grew furious, as the last corner of safe ground was cut off on all sides and grew smaller every moment; and how, in fine, the food was of altogether secondary importance, and might even have been nauseous, so long as we seasoned it with these dreams. . . .

One thing, at least, comes very clearly out of these considerations: that whatever we are to expect at the hands of children, it should not be any peddling exactitude about matters of fact. They walk in a vain show, and among mists and rainbows; they are passionate after dreams and unconcerned about realities; speech is a difficult art not wholly learned; and there is nothing in their own tastes or purposes to teach them what we mean by abstract truthfulness. When a bad writer is inexact, even if he can look back on half a century of years, we charge him with incompetence and not with dishonesty. And why not extend the same allowance to imperfect speakers? Let a stockbroker be dead stupid about poetry, or a poet inexact in the details of business, and we excuse them heartily from blame. But show us a miserable, unbreeched, human entity, whose whole profession it is to take a tub for a fortified town, and a shaving brush for the deadly stiletto, and who passes three fourths of his time in a dream and the rest in open self-deception, and we expect him to be as nice upon a matter of fact as a scientific expert bearing evidence. Upon my heart, I think it less than decent. You do not consider how little the child sees, or how swift he is to weave what he has seen into bewildering fiction; and that he cares no more for what you call truth, than you for a gingerbread dragoon.

I am reminded, as I write, that the child is very inquiring as to the precise truth of stories. But indeed this is a very different matter, and one bound up with the subject of play, and the precise amount of playfulness, or playability, to be looked for in the world. Many such burning questions must arise in the course of nursery education. Among the fauna of this planet, which already embraces the pretty soldier and the terrifying Irish beggarman, is, or is not, the child to expect a Bluebeard or a Cormoran? Is he, or is he not, to look out for magicians, kindly and potent? May he, or may he not, reasonably hope to be cast away upon a desert island, or turned to such diminutive proportions that he can live on equal terms with his lead soldiery, and go a cruise in his own toy schooner? Surely all these are practical questions to a neophyte entering upon life with a view to play. Precision upon such a point, the child can understand. But if you merely ask him of his past behavior, as to who threw such a stone, for instance,

or struck such and such a match; or whether he had looked into a parcel or gone by a forbidden path, — why, he can see no moment in the inquiry, and it is ten to one he has already half forgotten and half bemused himself with subsequent imaginings.

173. HANS GROSS. *Criminal Psychology* (transl. Kallen, 1911. §§ 79–82, pp. 368–374, in part); and *Criminal Investigation* (transl. Adam, 1907. p. 91.) . . . Of course we cannot fix absolutely the age at which witnesses are more or less worthy of credit; we must in addition and even to a greater extent take into account all the other elements which go to make up a man, his natural qualities and intellectual culture. But still certain broad rules may be laid down as to age. The conditions of the child's bringing-up, the things he learned to know, are what we must first of all learn. If the question in hand can fit into the notion the child possesses, he will answer better and more, though quite unendowed, than if a very clever child who is foreign to the notions of the defined situation. I should take intelligence only to be of next importance in such cases, and advise giving up separating clever from stupid children in favor of separating practical and unpractical children. The latter makes an essential difference. Both the children of talent and stupid children may be practical or unpractical. . . . The practical child will see, observe, properly understand, and reproduce a group of things that the unpractical child has not even observed. Of course, it is well, also, to have the child talented, but I repeat: the least clever practical child is worth more as witness than the most clever unpractical child. What the term "practical" stands for is difficult to say, but everybody knows it, and everybody who has cared about children at all, has seen that there are practical children.

In one sense the best witnesses are children of 7 to 10 years of age. Love and hatred, ambition and hypocrisy, considerations of religion and rank, of social position and fortune, are as yet unknown to them; it is impossible that preconceived opinions, nervous irritation, or long experience, should lead them to form erroneous impressions; the mind of the child is but a mirror that reflects accurately and clearly what is found before it. These are great advantages, accompanied by certain corresponding drawbacks. The greatest is that we cannot place ourselves at the point of view of the child; it uses indeed the same words as we do, but these words convey to it very different ideas. Further, the child perceives things differently from grown-up people. The conception of magnitude — great or small, of pace — fast or slow, of beauty and ugliness, of distance — near or far, are quite different in the child's brain from in ours; still more so when facts are in question. Facts to us perfectly indifferent delight or terrify the child, and what for us is magnificent or touching does not affect it in the least. We are ignorant of the impression produced on the child's mind. There is yet another difficulty; the horizon of the child being much narrower than ours, a large number of our perceptions are outside the frame within which alone the child can perceive. We know, within certain limits, the extent of this frame; we should not, for instance, question a child as to how a complicated piece of roguery was committed, or how adulterous relations have developed; we know it is ignorant of such things. But in many directions we do not know the exact point where its faculty of observation commences

or stops. At times we cannot explain how it does not understand something or other, while at other times we are astonished to see it find its bearings easily among matters thought to be well beyond its intelligence.

We are, as a rule, too distrustful of the capacity of a child. We have rarely found too much expected of it, while we have often discovered that it knew and noted much more than any one imagined. The same experience occurs to us in daily life. How many times do not people speak in its presence of things a child is not supposed to understand, only to discover later that it has not only understood very well, but has combined the information with other things heard before or after. Again it must not be forgotten that a child is peculiarly exposed to external influences, whether designed or accidental. Any one, knowing that a child is to appear as a witness in a court of justice, if he is interested in his statements, and has the chance of influencing it himself, will almost certainly exert that influence. The child, as yet devoid of principles, places great faith in the words of grown-up people; so if a grown-up person brings influences to bear on it, especially some time after the occurrence, the child will imagine it has really seen what it has been led to believe. This result is obtained with certainty if the man proceeds slowly and by degrees, leading the child to the desired goal by repeated simple questions, as "Is it not so?" "It was not so, was it not thus?" The result is the same, when the influence is undesigned. An important event happens; it is naturally much talked of, all sorts of hypotheses are started, there is gossip of what others have seen or might in certain circumstances have seen. If a child, which has itself seen something of the occurrence, hears these conversations, they become deeply engraved on its young mind, and ultimately it believes it has itself seen what the others have related. One must therefore be always careful in questioning children, but their statements, if judiciously obtained, generally supply material of great value.

In passing from the child to the succeeding age, it becomes necessary to distinguish sex; for just as sex differentiates in external appearance the youth from the girl, so are they differentiated in their methods of perception. An intelligent boy is undoubtedly the best observer to be found. The world begins to take him by storm with its thousand matters of interest; what the school and his daily life furnish cannot satisfy his overflowing and generous heart. He lays hold of everything new, striking, strange, all his senses are on the stretch to assimilate it as far as possible. No one notices a change in the house, no one discovers the bird's nest, no one observes anything out of the way in the fields; but nothing of that sort escapes the boy, everything which emerges above the monotonous level of daily life gives him a good opportunity for exercising his wits, for extending his knowledge, and for attracting the attention of his elders, to whom he communicates his discoveries. The spirit of the youth not having as yet been led astray by the necessities of life, its storms and battles, its factions and quarrels, he can freely abandon himself to everything which appears out of the way; his life has not yet been disturbed by education though he often observes more clearly and accurately than any adult. . . . We say again that an intelligent boy is, as a rule, the best witness in the world.

It is a different affair with a young girl of the same age. Her natural qualities and her education prevent her acquiring the necessary knowledge

and the breadth of view which the boy soon achieves, and these are the conditions absolutely indispensable for accurate observation. The girl remains longer in the narrow family circle, at her mother's apron strings. . . . The girl has no training of the boy's sort; she goes out less, she has little to do with workmen, artisans, or tradesmen, who are in many ways the schoolmasters of the boy anxious to learn; she sees nothing of human life, and when anything extraordinary happens she is incapable, one might almost suggest, of seizing it with her senses, that is to say, of observing accurately. If besides there be danger, noise, fear, all which attract the boy and serve to excite his curiosity, she gets out of the way in alarm, and either sees nothing or sees it indistinctly from a distance. A young girl may even in certain circumstances be a dangerous witness, when she is interested in the matter or is herself perchance the center. In such a case strong exaggerations and even pure inventions are to be feared. Natural gifts, imagination, dreaming, romantic exaltation, such are the natural degrees by which the girl, too young yet to have had any interesting experiences of her own, arrives at last at "Byronism." Now Byronism is a sort of ennui or weariness of life, always urging one to seek for change; and what happier variety could there be than a criminal matter in which the little lady finds herself mixed up. It is interesting enough in itself to appear in the witness box, to make a deposition and to intervene in the destiny of another; but how much more noteworthy is it when an important matter is in question, when the attention of every one is turned upon the witness, when all the world is breathless to learn what she has been asked, what she has replied, and how the case is going to turn. Thus an insignificant theft is easily magnified into a robbery with violence; the witness, out of a miserable swindler, manufactures a pale and interesting young man; a coarse word becomes a blow; an insignificant event develops into a romantic abduction; stupid chaff turns up as a great conspiracy. . . . But, to be just, we must recognize on the other hand that no one notices and knows certain things more cleverly than a young girl. If her imagination does not carry her away, she can furnish information more valuable than any grown-up person. . . . No one discovers more rapidly than, a sprightly young girl approaching maturity the little carryings-on and intrigues of her neighbors. . . . Connected with this is the trick young girls have of spying on certain people. An interesting beauty or a young man acquaintance have no more vigilant watcher of all their goings on than their neighbor — a little girl of twelve to fourteen. No one knows better than she who they are, what they do, what company they keep, when they go out, and how they dress. She even notes the moral traits of those coming under her supervision, — their joy, their grief, their disappointments, their hopes, and all their experiences. If one desires information on such subjects, the best witnesses are schoolgirls — always supposing that they are willing to tell the truth.

From youth we pass to adults, who though in the flower of their existence, are far from furnishing the best witnesses. The adult is in general the worst of all observers. Finding himself in the happiest epoch of his life, full of hope and ideals, interested only in himself and his desires, the young man finds nothing important but himself. . . . The typical representative of this age is the young lady, to whom the disappearance of the

world would be a matter of no moment compared with the momentous matter of a ball; or the student, to whom his club or society is the most serious thing under the sun. All this of course changes with time; but youth with its plenitude of force is the personification of that robust egoism which takes possession of the world and in all its diversions sees only itself. Any one who has critically watched himself and watched others knows all this; whoever has had the opportunity of questioning young people about important facts happening in their neighborhood is at once irritated and delighted at the sublime indifference exhibited. But if perchance the young man has observed, his deposition will be true and trustworthy; he has preserved his good principles, not yet scattered by the storms of life.

In middle age, man employs all the forces with which he has been endowed by nature; his good and bad qualities alike have reached their fullest development; and what the middle-aged man and woman want to perceive, they can perceive and describe. Their career, the goal of their labors is fixed; their likes and their dislikes are formed, and that decisively; the middle-aged man thus has a clearly defined position in all circumstances; when it is a question of testimony as to justice or injustice he advances with a firm and a decided step. True, this is the case only with the man of sound moral principles. For there is no period of life in which man is assailed more violently by his passions, malevolence, egoism, self-seeking, discord, than when he mounts to the highest plane of his life, when he is the most active but also the most unreasonable. These passions never exert their influence on him more strongly than at this age; their omnipotence makes him an unconscious liar; and there is no witness more difficult to tackle, or more dangerous, than the man in full possession of all his faculties, both good and bad. . . .

The old man comes last; he is either sweet and conciliatory, or sour and cynical, according to his luck in life. His senses and faculties of observation are weakened; but experience tells him by a sort of insight what his eyes do not catch, and frequently his opinion may be summed up in the words, "To understand is to forgive." In fact, the old man has become a child again; accurate perception of external objects is wanting, but also his passions are dulled. He sees simply and without cunning, the difference between the sexes is again accentuated, the old man and the old woman see and understand things like children, and the suggestions of another in favor of this or that regain their power, just as when they were young.

Senile individuals require especial treatment as witnesses. . . . Accurate observation will reveal only two types of senility. There is the embittered type; and there is the character expressed in the phrase, "to understand all is to forgive all." Senility rarely succeeds in presenting facts objectively. Everything it tells is bound up with its judgment, and its judgment is either negative or positive. The judgment's nature depends less on the old man's emotional character than on his experience in life. If he is one of the embittered, he will probably so describe a possibly harmful, but not bad, event as to be able to complain of the wickedness of the world, which brought it about, that at one time such and such an evil happened to him. The excusing senile will begin with "Good God, it wasn't so bad. The people were young and merry, and so one of them —." That the same event is presented in a fundamentally different light by each is obvious. For-

unately the senile is easily seen through and his first words show how he looks at things. He makes difficulties mainly by introducing memories which always color and modify the evidence. The familiar fact that very old men remember things long past better than immediate occurrences, is to be explained by the situation that the ancient brain retains only that which it has frequently experienced.

174. G. STANLEY HALL. *Children's Lies*. (American Journal of Psychology, 1891. Vol. III, p. 59.) These returns [from a systematic inquiry] now represent nearly three hundred city children of both sexes, mostly from twelve to fourteen years of age. . . . A general statement of them, according to the groups into which they naturally fall, will be serviceable, it is hoped, to thoughtful parents and teachers as well as to psychologists.

I. No children were found destitute of high ideals of truthfulness. Perhaps the lowest moral development is represented by about a dozen children who regarded every deviation from the most painfully literal truth as alike heinous, with no perspective or degrees of difference between white and black fibbing and the most barefaced intended or unintended lies. This mental state, though in a few cases probably priggish and affected, became in others so neurotic that to every statement, even to yes and no, "I think" or "perhaps" was added mentally, whispered, or in two cases aloud, and nothing could prompt a positive, unqualified assertion. This condition (not unknown among adults in certain morbid states of conscience) we will designate as pseudophobia, and place it among the many other morbid fears that prey upon unformed or unpoised minds. One boy told of "spells" of saying over hundreds of times when alone the word "not," in the vague hope it might somehow be interpolated into the divine record of his many wrong stories, past and future, to disinfect them and neutralize his guilt. Another had a long period of fear that like Ananias and Sapphira he might some moment drop down dead for a chance and perhaps unconscious lie. . . . This moral superstition, which seemed mostly due to mixing ethical and religious teaching in unpedagogic ways or proportions in home or Sunday school, is happily rare, generally fugitive, is not germane to the nature of childhood, and is likely to rectify itself. Where it persists, it begets a quibbling, word-splitting tendency, a logolatry, or a casuistic habit, resulting sometimes in very systematic palliatives, tricks, and evasions, which may become distinctly morbid. . . .

II. Strongly contrasted with this state, and far more common, is that in which lies are justified as means to noble ends. Children all admire burly boys who by false confessions take upon themselves the penalties for the sins of weaker playmates, or even girls who are conscious of being favorites with teacher or parent, or of superior powers of blandishment, and who claim to be the authors of the misdeeds of their more disfavored mates. . . . A teacher who told her class of thirteen-year-old children the tale of the French girl in the days of the Commune, who, when on her way to execution on a petty charge, met her betrothed and responded to his agonized appeals, "Sir, I do not know you," and passed on to death alone, because she feared recognition might involve him in her doom, was saddened because she found it so hard to make her pupils name as a lie what was so eclipsed by heroism and love. Children have a wholesome

instinct for viewing moral situations as wholes, but yet are not insensitive to that eager and sometimes tragic interest which has always for men invested those situations in both life and literature where duties seem to conflict. The normal child feels the heroism of the unaccountable instinct of self-sacrifice far earlier and more keenly than it can appreciate the sublimity of truth. . . .

III. With most children, as with savages, truthfulness is greatly affected by personal likes and dislikes. In many cases they could hardly be brought to see wrong in lies a parent or some kind friend had wished them to tell. Often suspected lies were long persisted in, until they were asked if they would have said that to their mothers, when they at once weakened. . . . The girls in our returns were more addicted to this class of lies than boys. Boys keep up joint or plotted lies, which girls rarely do, who "tell on" others because they are "sure to be found out," or "some one else will tell"; while boys can be more readily brought to confess small thefts, and are surer to own up if caught, than girls. . . . All children find it harder to cheat in their lessons with a teacher they like. . . . To simulate or dissimulate to the priest, or above all, to God, was repeatedly referred to as worst of all. . . . Truth for our friends and lies for our enemies is a practical, though not distinctly conscious rule, widely current with children, as with uncivilized and, indeed, even with civilized races. . . .

IV. The greatest number of lies in our collections are prompted by some of the more familiar manifestations of selfishness. Every game, especially every exciting one, has its own temptation to cheat; and long records of miscounts in tallies, moving balls in croquet, crying out "no play" or "no fair" at critical moments to divert impending defeat, false claims made to umpires, and scores of others, show how unscrupulous the all-constraining passion to excel often renders even young children. . . . School life is responsible for very many, if not most, of the deliberate lies of this class. . . . Children copy school work, and monitors get others to do theirs as pay for not reporting them, while if a boy is reported, he tells of as much disorder as possible on the part of others, to show that the monitor did not do his duty. . . . The long list of headaches, nosebleeds, stomach-aches, etc. feigned to get out of going to school, of false excuses for absence and tardiness, the teacher, especially, if disliked, being so often exceptionally fair game for all the arts of deception, — all this seems generally prevalent. This class of lies ease children over so many hard places in life and are convenient covers for weakness and even vice. . . .

V. Much childish play owes its charm to partial self-deception. Children imagine or make believe they are animals, making their noises and imitating their activities; that they are soldiers, and imagine panoramas of warlike events; that they are hunters in extreme peril from wild beasts; Indians, artisans, and tradesmen of many kinds; doctors, preachers, angels, ogres. They play school, court, meeting, congress. If hit with wooden daggers in the game of war, they stand aside and play they are dead. . . . They baptize cats, bury dolls, have puppet shows with so many pin admission, all with elaborate details. They dress up and mimic other, often older, people, ride on the horse cars and imagine them fine carriages, get up doll hospitals and play surgeon or Florence Nightingale. The more severe the discipline of the play-teacher and the more savage the play-mother, the

better the fun. . . . It seems almost the rule that imaginative children are more likely to be dull in school work, and that those who excel in it are more likely to have fewer or less vivid mental images of their own. . . . One early manifestation of the shadowy falsity to fact of the idealizing temperament is often seen in children of three or four, who suddenly assert that they saw a pig with five ears, a dog as big as a horse, or, if older, apples on a cherry tree, and other Munchausen wonders, which really means at once but little more than that they have that thought or have made that mental combination independently of experience. They come to love to tell semiplausible stories, and perhaps, when the astonishment is over, to confess. . . . We might almost say of children at least, somewhat as Froschamer argues of mental activity, and even of universe itself, that all their life is imagination. . . .

VI. A less common class of what we may call pathological lies was illustrated by about a score of cases in our returns. The love of showing off and seeming big, to attract attention or to win admiration, sometimes leads children to assume false characters, *e.g.* on going to a new town or school, kept up with difficulty by many false pretenses awhile, but likely to become transparent and collapse, and getting the masker generally disliked. A few children, especially girls, are honeycombed with morbid self-consciousness and affectation, and seem to have no natural character of their own, but to be always acting a part and attracting attention; boys preferring fooling, and humbugging by tricks or lies, sometimes of almost preternatural acuteness and cleverness.

VII. Finally, children have many palliatives for lies that wound the conscience. . . . An acted lie is far less frequently felt than a spoken one; so to nod is less sinful than to say yes; to point the wrong way, when asked where some one is gone, is less guilty than to say wrongly. Pantomimed lies are, in short, for the most part easily gotten away with. It is very common for children to deny in the strongest and most solemn way wrongs they are accused of, and when, at length, evidence is overwhelming, to explain or to think, "My hand or foot did it, not I." The distinction is not unnatural in children whose teachers or parents so often snap or whip the particular member which has committed the offense. In short, hardly any of the sinuosities lately asserted, whether rightly or wrongly, of the earlier Jesuit confessionals, and all the elaborated pharmacopœia of placebos they are said to have used to ease consciences outraged by falsehood, seemed reproduced in the spontaneous endeavors of children to mitigate the poignancy of this sense of guilt.

In fine, some forms of the habit of lying are so prevalent among young children that all illustrations of it, like the above, seem trite and commonplace. Thoroughgoing truthfulness comes hard and late, and school life is so full of temptation to falsehood that an honest child is its rarest, as well as its noblest, work. The chief practical point is for the teacher to distinguish the different forms of the disease and apply the remedies best for each. So far from being a simple perversity, it is so exceedingly complex, and born of such diverse and even opposite tendencies that a course of treatment that would cure one form would sometimes directly aggravate another.

175. AMOS C. MILLER. *Examination of Witnesses*. (Illinois Law Review. Vol. II, 260.) . . . *Cross-examining Children*. This is a matter of great delicacy. I have seen distinguished, able, and skillful trial lawyers make the fatal mistake of being unnecessarily severe in cross-examining children. They were probably unconscious of their attitude. But the effect was to excite sympathy for the child and resentment toward the lawyer, with the quite natural result that the jury believed the child. My own belief, from personal observation, is that children are very unreliable witnesses. They are impressionable, their imaginations are active, and their memories are short. They can easily be trained to believe they saw or heard what they did not see or hear. They are very hard to corner. I know of no other way to handle them than by kindness, patience, and persistence. Sometimes by these means it will be shown that they are uncertain on many points, or that they have been talked to by some other witness, or that certain things that they have testified to they know only by hearsay, or perhaps on some collateral matter they can be led to testify directly contrary to what every one knows is the truth. If some of the opposing witnesses are children, *don't fail to ask that the witnesses be excluded* from the court room during the opening statements and the taking of testimony.

SUB-TITLE C: SEX

179. HANS GROSS. *Criminal Psychology*. (1911. transl. Kallen, § 63, p. 300.) One of the most difficult tasks of the criminalist who is engaged in psychological investigation is the judgment of woman. Woman is not only somatically and psychically rather different from man; man never is able wholly and completely to put himself in her place. . . . To the nature of woman, we men totally lack avenues of approach. We can find no parallel between women and ourselves, and the greatest mistakes in criminal law were made where the conclusions would have been correct if the woman had been a man. We have always estimated the deeds and statements of women by the same standards as those of men, and we have always been wrong. . . . We proceed wrongly in the valuation of woman. We cannot attain proper knowledge of her because we men were never women, and women can never explain themselves to us because they were never men. . . .

(a) *Intelligence*. Feminine intelligence properly deserves a separate section. Intelligence is a function that has in both sexes some basis and purpose, and proceeds according to the same rules; but the meaning of intelligence must be abandoned if we are to suppose it so rigid and so diffi-

cult to hold, that the age-long differences between man and woman could have had no influence on it.

(1) *Conception*. In sense perception there is no significant difference between the two sexes; although in conceptual power we find differences very distinct. It may be generally said, as the daily life shows, that women conceive differently from men. Whatever a dozen men may agree on conceptually, will be differently thought of by any one woman. In the apprehension of situations, the perception of attitudes, the judgment of people in certain relations, in all that is called tact, *i.e.* in all that involves some abstraction or clarification of confused and twisted material, and finally, in all that involves human volitions, women are superior, and more reliable individually, than ten men together. But the manner in which the woman obtains her conception is less valuable, being the manner of pure instinct. . . . The process is mainly unconscious, and is hence of less value only, if I may say so, as requiring less thought. In consequence, there is not only not a decrease in the utility of feminine testimony; also its reliability is very great. There may be hundreds of errors in the dialectical procedure of a man, while there is much more certainty in the instinctive conception and the direct reproduction of a woman. Hence, her statements are more reliable. . . .

We need not call the source of this instinct God's restitution for feminine deficiency in other matters; we can show that it is due to natural selection, and that the position and task of woman requires her to observe her environment very closely. This need sharpened the inner sense until it became unconscious conception. Feminine interest in the environment is what gives female intuition a swiftness and certainty unattainable in the meditations of the profoundest philosophers. The swiftness of the intuition, which excludes all reflection, and which merely solves problems, is the important thing. . . . Woman does not reason and infer, and if things miss her intuition, they do not exist for her.

Objectivity is another property that women lack. They tend always to think in personalities, and they conceive objects in terms of personal sympathies. Tell a woman about a case so that her interest will be excited without your naming the individuals save as A and B, and it will be impossible to get her to take a stand or to make a judgment. Who are the people, what are they, how old are they, etc.? These questions must be answered first. Hence the divergent feminine conceptions of a case before and after the names are discovered. The personalizing tendency results in some extraordinary things. Suppose a woman is describing a brawl between two persons, or two groups. If the sides were equally matched in strength and weapons, and if the witness in question did not know any of the fighters before, she will nevertheless redistribute sun and wind in her description if one of the brawlers happens accidentally to have interested her, or has behaved in a "knightly" fashion, though under other circumstances he might have earned only her dislike. (In such cases the fairy tale about telling "mere facts" recurs, and I have to repeat that *nobody* tells mere facts — that judgment and inference always enter into statements and that women use them more than men.) . . . The same is true in purely individual cases. In the eyes of woman the same crime committed by one man is black as hell; committed by another, it is in all respects excusable. . . . Of

course women are not alone in taking such attitudes ; but they are never so clear, so typical, nor so determined as when taken by women.

(2) *Judgment.* Avenarius tells of an English couple who were speaking about angels' wings. It was the man's opinion that this angelic possession was doubtful ; the woman's, that the angels lacked wings because they couldn't have any. Many a woman witness has reminded me of this story, and I have been able to explain by use of it many an event. Woman says "because" when she knows of no reason ; "because" when her own arguments bore her ; "because" when she is confused ; when she does not understand the evidence of her opponent, and particularly when she desires something. Unfortunately, she hides this attitude under many words, and one often wishes for the simple assertion of the English woman, "because." In consequence, when we want to learn their ratio sciendi from women, we get into difficulties. They offer us a collection of frequently astonishing and important things, but when we ask for the source of this collection we get "because" in variations, from a shrug of the shoulders to a flood of words. The inexperienced judge may be deceived by the positiveness of such expressions and believe that such certainty must be based on something which the witness cannot utter through lack of skill. If, now, the judge is going to help the "unaided" witness with "of course you mean because," or "perhaps because," etc., the witness, if she is not a fool, will say "yes." Thus we get apparently well-founded assertions which are really founded on nothing more than "because."

Cases dealing with divisions, distinctions, and analysis rarely contain ungrounded assertions by women. Women are well able to analyze and explain data, and what one is capable of and understands, one succeeds in justifying. Their difficulty is in synthetic work, in progressive movements and there they simply assert. The few women witnesses for the defense often become the most dangerous for the defenders.

But here, also, women find a limit, perhaps because, like all weaklings, they are afraid to draw the ultimate conclusions. As Leroux says in *De l'Humanité*, "If criminals were left to women, they would kill them all in the first burst of anger, and if one waited until this burst had subsided, they would release them all." The killing points to the easy excitability, the passionateness, and the instinctive sense of justice in women which demands immediate revenge for evil deeds. The liberation points to the fact that women are afraid of every energetic deduction of ultimate consequences, *i.e.* they have no knowledge of real justice. "Men look for reasons, women judge by love ; women can love and hate, but they cannot be just without loving, nor can they ever learn to value justice." So says Schiller, and how frequently do we not hear the woman's question whether the accused's fate is going to depend on her evidence. If we say yes, there is, as a rule, a restriction of testimony, a titillation and twisting of consequences, and this circumstance must always be remembered. If you want to get truth from a woman, you must know the proper time to begin and, what is more important, when to stop. As the old proverb says, and it is one to take to heart, "Women are wise when they act unconsciously, fools when they reflect."

(3) *Quarrels with Women.* This little matter is intended only for very young and inexperienced criminal justices. There is nothing more excit-

ing or instructive than a quarrel with clever and trained women concerning worthy subjects; but this does not happen in court; and 90 per cent of our woman witnesses are not to be quarreled with. . . . Women have an obstinacy, and it is no easy matter to be passive against it. But in the interest of justice, the part of the wise man is not to lose any time by making an exhibition of himself through verbal quarrels with women witnesses. . . .

(b) *Honesty*. We shall speak here only of the honesty of the sort of women the courts have most to do with, and in this regard there is little to give us joy. Not to be honest, and to lie, are two different things; the latter is positive, the former negative; the dishonest person does not tell the truth, the liar tells the untruth. It is dishonest to suppress a portion of the truth, to lead others into mistakes, to fail to justify appearances, and to make use of appearances. The dishonest person may not have said a single untrue word, and still may have introduced many more difficulties, confusions, and deceptions than the liar. He is for this reason more dangerous than the latter. Also, because his conduct is more difficult to uncover, and because he is more difficult to conquer than the liar. Dishonesty is, however, a specially feminine characteristic; in men it occurs only when they are effeminate. Real manliness and dishonesty are concepts which cannot be united. Hence, the popular proverb says, "Women always tell the truth, but not the whole truth."

And this is more accurate than the charge of many writers, that women lie. I do not believe that the criminal courts can verify the latter accusation. I do not mean that women never lie — they lie enough — but they do not lie more than men do, and none of us would attribute lying to women as a sex trait. To do so, would be to confuse dishonesty with lying. . . .

Balzac asks, "Have you ever observed a lie in the attitude and manner of woman? Deceit is as easy to them as falling snow in heaven." But this is true only if he means dishonesty. It is not true that it is easy for women really to lie. . . .

But even her simplest affirmation or denial is not honest. Her "no" is not definite; *e.g.* her "no" to a man's demands. Still further, when a man affirms or denies, and there is some limitation to his assertion, he either announces it expressly or the more trained ear recognizes its presence in the failure to conclude, in a hesitation of the tone. But the woman says "yes" and "no," even when only a small portion of one or the other asserts a truth behind which she can hide herself. . . .

So Schopenhauer agrees: "Nature has given women only one means of protection and defense — hypocrisy; this is congenital with them, and the use of it is as natural as the animal's use of its claws. Women feel they have a certain degree of justification for their hypocrisy."

With this hypocrisy we have, as lawyers, to wage a constant battle. Quite apart from the various ills and diseases which women assume before the judge, everything else is pretended; innocence, love of children, spouses, and parents; pain at loss and despair at reproaches; a breaking heart at separation; and piety, — in short, whatever may be useful. This subjects the examining justice to the dangers and difficulties of being either too harsh, or being fooled. He can save himself much trouble by remembering that in this simulation there is much dishonesty and few lies. . . .

(d) *Emotional Disposition, and Related Subjects.* Madame de Krüdener writes in a letter to Bernardin de St. Pierre: "Je voulais être sentie." These laconic words of this wise pietist give us an insight into the significance of emotional life of woman. Man wants to be understood, woman to be felt. With this emotion she spoils much that man might do because of his sense of justice. Indeed, a number of qualities which the woman uses to make herself noted are bound up with her emotional life, more or less. Compassion, self-sacrifice, religion, superstition, — all these depend on the highly developed, almost diseased formation of her emotional life. Feminine charity, feminine activity as a nurse, feminine petitions for the pardon of criminals, infinite other samples of women's kindly dispositions, must convince us that these activities are an integral part of their emotional life, and that women perform them only, perhaps, in a kind of dark perception of their own helplessness.

Spencer says that the feminine mind shows a definite lack with regard to the sense of justice. . . . These assertions show that women are deficient in justice, but do not show why. The deficiency is to be explained only in the superabundance of emotional life. This superabundance clarifies a number of facts of their daily routine. . . . The rich emotion restores a thousand times what may be missing in justice, and perhaps in many cases hits better upon what is absolutely right than the bare masculine sense of justice. We are, of course, frequently mistaken by relying on the testimony of women, but only when we assume that our rigorously judicial sentence is the only correct one, and when we do not know how women judge. Hence, we interpret women's testimonies with difficulty and rarely with correctness; we forget that almost every feminine statement contains in itself much more judgment than the testimony of men; we fail to examine how much real judgment it contains; and finally, we weigh this judgment in other scales than those used by the woman. We do best, therefore, when we take the testimony of man and woman together in order to find the right average. This is not easy, for we are unable to enter properly into the emotional life of woman, and cannot therefore discount that tendency of hers to drag the objective truth in some biased direction. . . . She fights with all her strength on the side that seems to her to be oppressed and innocently persecuted, irrespective of whether it is the side of the accused or of his enemy. In consequence, we must first of all, when judging her statements, determine the direction in which her emotion impels her, and this cannot be done with a mere knowledge of human nature. Nothing will do except a careful study of the specific feminine witness at the time she gives her evidence. . . .

When we summarize all we know about woman, we may say briefly: Woman is neither better nor worse, neither more nor less valuable than man, but she is different from him. Inasmuch as nature has created every object correctly for its purpose, woman has also been so created. The reason of her existence is different from that of man's; hence, her nature is different.

180. ARTHUR C. TRAIN. *The Prisoner at the Bar.* (1908. 2d ed. p. 279.) Roughly speaking, women exhibit about the same idiosyncrasies and limitations in the witness chair as the opposite sex, and at first thought one

would be apt to say that it would be fruitless and absurd to attempt to predicate any general principles in regard to their testimony, but a careful study of female witnesses as a whole will result in the inevitable conclusion that their evidence has virtues and limitations peculiar to itself.

Whatever difference does exist in character between the testimony of men and women has its root in the generally recognized diversity in the mental processes of the two sexes. Men, it is commonly declared, rely upon their powers of reason; women upon their intuition. Not that the former is frequently any more accurate than the latter. But our courts of law (at least those in English-speaking countries) are devised and organized, perhaps unfortunately, on the principle that testimony not apparently deduced by the syllogistic method from the observation of relevant fact is valueless, and hence woman at the very outset is placed at a disadvantage and her usefulness as a probative force sadly crippled.

The good old lady who takes the witness chair and swears that she *knows* the prisoner took her purse has perhaps quite as good a basis for her opinion and her testimony (even though she cannot give a single reason for her belief and becomes hopelessly confused on cross-examination) as the man who reaches the same conclusion ostensibly by virtue of having seen the defendant near by, observed his hand reaching for the purse, and then perceived him take to his heels. She has never been taught to reason and has really never found it necessary, having wandered through life by inference or, more frankly, by guesswork, until she is no longer able to point out the simplest stages of her most ordinary mental processes.

As the reader is already aware, the value of all honestly given testimony depends, first, upon the witness's original capacity to observe the facts; second, upon his ability to remember what he has seen and not to confuse knowledge with *imagination*, *belief*, or *custom*, and, lastly, upon his power to express what he has, in fact, seen and remembers.

Women do not differ from men in their original capacity to observe, which is a quality developed by the training and environment of the individual. It is in the second class of the witness's limitations that women as a whole are more likely to trip than men, for they are prone to swear to circumstances as facts, of *their own knowledge*, simply because they confuse what they have really observed with what they believe did occur or should have occurred, or with what they are convinced did happen simply because it was accustomed to happen in the past.

Perhaps the best illustration of the female habit of swearing that facts occurred because they *usually* occurred, was exhibited in the Twitchell murder trial in Philadelphia, cited in Wellman's "*Art of Cross-examination*." The defendant had killed his wife with a blackjack, and having dragged her body into the back yard, carefully unbolted the gate leading to the adjacent alley and, retiring to the house, went to bed. His purpose was to create the impression that she had been murdered by some one from outside the premises. To carry out the suggestion, he bent a poker and left it lying near the body smeared with blood. In the morning the servant girl found her mistress and ran shrieking into the street.

At the trial she swore positively that she was first obliged to *unbolt the door* in order to get out. Nothing could shake her testimony, and she thus unconsciously negatived the entire value of the defendant's adroit precau-

tions. He was justly convicted, although upon absolutely erroneous testimony. . . .

Though the conclusions to which women frequently jump may usually be shown by careful interrogation to be founded upon observation of actual fact, their habit of stating inferences often leads them to claim knowledge of the impossible — “wiser in [their] own conceit than seven men that can render a reason.”

In a very recent case where a clever thief had been convicted of looting various apartments in New York City of over eighty thousand dollars' worth of jewelry, the female owners were summoned to identify their property. The writer believes that in every instance these ladies were absolutely ingenuous and intended to tell the absolute truth. Each and every one positively identified various of the loose stones found in the possession of the prisoner as her own. This was the case even when the diamonds, emeralds, and pearls had no distinguishing marks at all. It was a human impossibility actually to identify any such objects, and yet these eminently respectable and intelligent gentlewomen swore positively that they could recognize their jewels. They drew the inference merely that as the prisoner had stolen similar jewels from them these must be the actual ones which they had lost, an inference very likely correct, but valueless in a tribunal of justice.

Where their inferences are questioned, women, as a rule, are much more ready to “swear their testimony through” than men. They are so accustomed to act upon inference that, finding themselves unable to substantiate their assertion by any sufficient reason, they become irritated, “show fight,” and seek refuge in prevarication. Had they not, during their entire lives, been accustomed to mental short cuts, they would be spared the humiliation of seeing their evidence “stricken from the record.”

One of the ladies referred to testified as follows:

“Can you identify that diamond?”

“*I am quite sure that it is mine.*”

“How do you know?”

“*It looks exactly like it.*”

“But may it not be a similar one and not your own?”

“*No; it is mine.*”

“But how? It has no marks.”

“*I don't care. I know it is mine. I SWEAR IT IS!*”

The good lady supposed that, unless she swore to the fact, she might lose her jewel, which was, of course, not the case at all, as the sworn testimony founded upon nothing but inference left her in no better position than she was in before.

The writer regrets to say that observation would lead him to believe that women as a rule have somewhat less regard for the spirit of their oaths than men, and that they are more ready, if it be necessary, to commit perjury. This may arise from the fact that women are fully aware that their sex protects them from the same severity of cross-examination to which men would be subjected under similar circumstances. It is to-day fatal to a lawyer's case if he be not invariably gentle and courteous with a female witness, and this is true even if she be a veritable Sapphira.

In spite of these limitations, which, of course, affect the testimony of

almost every person, irrespective of sex, women, with the possible exception of children, make the most remarkable witnesses to be found in the courts. They are almost invariably quick and positive in their answers, keenly alive to the dramatic possibilities of the situation, and with an unerring instinct for a trap or compromising admission.

A woman will inevitably couple with a categorical answer to a question, if in truth she can be induced to give one at all, a statement of damaging character to her opponent. For example:

"Do you know the defendant?"

"Yes, — to my cost!"

Or:

"How old are you?"

"Twenty-three, — old enough to have known better than to trust him."

Forced to make an admission which would seem to hurt her position, the explanation, instead of being left for the redirect examination of her own counsel, is instantly added to her answer then and there.

"Do you admit that you were on Forty-second Street at midnight?"

"Yes. *But it was in response to a message sent by the defendant through his cousin.*"

What is commonly known as "silent cross-examination" is generally the most effective. The jury realize the difficulties of the situation for the lawyer, and are not unlikely to sympathize with him, unless he makes bold to attack the witness, when they quickly change their attitude.

One question, and that as to the witness's means of livelihood, is often sufficient.

"How do you support yourself?"

"I am a lady of leisure!" replies the witness (arrayed in flamboyant colors) snappishly.

"That will do, thank you," remarks the lawyer with a smile. "You may step down."

The writer remembers being nicely hoisted by his own petard on a similar occasion:

"What do you do for a living?" he asked.

The witness, a rather deceptively arrayed woman, turned upon him with a glance of contempt:

"I am a respectable married woman, with seven children," she retorted. "*I do nothing for a living except* cook, wash, scrub, make beds, clean windows, mend my children's clothes, mind the baby, teach the four oldest their lessons, take care of my husband, and try to get enough sleep to be up by five in the morning. I guess if some lawyers worked as hard as I do, they would have sense enough not to ask impertinent questions."

There is no witness in the world more difficult to cope with than a shrewd old woman who apes stupidity, only to reiterate the gist of her testimony in such incisive fashion as to leave it indelibly imprinted on the minds of the jury. The lawyer is bound by every law of decency, policy, and manners to treat the aged dame with the utmost consideration. He must allow her to ramble on discursively in defiance of every rule of law and evidence in answer to the simplest question; must receive imperturbably the opinions and speculations upon every subject of both herself and (through her) of her neighbors; only to find when he thinks she must be exhausted by her

own volubility, that she is ready, at the slightest opportunity, to break away again into a tangle of guesswork and hearsay, interwoven with conclusions and ejaculation. Woe be unto him if he has not sense enough to waive her off the stand! He might as well try to harness a Valkyrie as to restrain a pugnacious old Irishwoman who is intent on getting the whole business before the jury in her own way.

In the recent case of Gustav Dinser, convicted of murder, a vigorous old lady took the stand and testified forcibly against the accused. She was as "smart as paint," as the saying goes, and resolutely refused to answer any questions put to her by counsel for the defense. Instead, she would raise her voice and make a savage onslaught upon the prisoner, rehearsing his brutal treatment of the deceased on previous occasions, and getting in the most damaging testimony.

"Do you say, Mrs. —," the lawyer would inquire deferentially, "that you heard the sound of *three* blows?"

"Oh, thim blows!" the old lady would cry — "thim turrible blows! I could hear the villain as he laid thim on! I could hear the poor, pitiful groans av her, and she so sufferin'! 'Twas awful! Howly Saints, 'twould make yer blood run cowl!"

"Stop! stop!" exclaimed the lawyer.

"Ah, stop is it? Ye can't stop me till Oi've had me say to tell the whole truth. I says to me daughter Ellen, says I: 'Th' horrid baste is afther murtherin' the poor thing,' says I; 'run out an' git an officer!'"

"I object to all this!" shouts the lawyer.

"Ah, ye objec', do ye?" retorts the old lady. "Shure an' ye'd have been after objectin' if ye'd heard thim turrible blows that kilt her — the poor, sufferin', swate crayter! I hope he gits all that's comin' to him — bad cess to him for a bloody-thirsty divil!"

The lawyer ignominiously abandoned the attack.

To recapitulate, the quickness and positiveness of women make them ordinarily better witnesses than men; they are vastly more difficult to cross-examine; their sex protects them from many of the most effective weapons of the lawyer, with the result that they are the more ready to yield to prevarication; and, even where the possibility of complete and unrestricted cross-examination is afforded, their tendency to inaccurately inferential reasoning, and their elusiveness in dodging from one conclusion to another, render the opportunity of little value.

In general, however, women's testimony differs little in quality from that of men, all testimony being subject to the same three great limitations irrespective of the sex of the witness, and the conclusions set forth above are merely the result of an effort on the part of the writer to comment somewhat upon those small differences which, under close scrutiny, may fairly be said to exist. These differences are quite as noticeable at the breakfast table as in the court room; and are no more patent to the advocate than to the ordinary male animal whose forehead habitually reddens when he hears the unanswerable reason which, in default of all others, explains and glorifies the mental action of his wife, sister, or mother: "Just because!"

181. CHARLES C. MOORE. *A Treatise on Facts, or the Weight and Value of Evidence*. (1908. Vol. II, §§ 914-920). . . . *Observation of Women*. We have seen that attention is essential to accuracy of observation. Experimental researches upon voluntary attention show, says Ribot, that attention generally requires more time in women than in men. But he remarks in another place, that "the janitor's wife will spontaneously lend her whole attention to the gossip of her neighbors," and that "a woman will take in, in the twinkling of an eye, the complete toilet of a rival," thus giving them credit for celerity of attention commensurate with intensity of interest, — which is about as much as can be conceded to anybody. Dr. Gross, an authority of very high rank, says "a woman is more patient, more attentive, more cunning, and more reflecting than a man." Professor James says "women in general train their peripheral visual attention more than men," that is to say, their attention to objects lying in the marginal portions of the field of vision. . . .

Memory of Women. There is little or no ground for contending that a woman is sui generis in respect of her faculty of memory. Some things naturally engage a woman's special attention and interest which would be regarded with comparative indifference by a man. But very many men are likewise inattentive to things which have a strong attraction for other men. Professor Thorndike declares that "many a woman of generally feeble memory can remember every dress she has owned since she was ten years old." Methodical inquiries by Professor Colegrove have led him to conclude that in the general average for the whole life women have a slightly higher percentage of visual, auditory, gustatory, and tactile memories than men. . . .

Veracity of Women. Schopenhauer declared that women, being the weaker sex and dependent therefore upon craft and not upon strength, have an instinctive capacity for cunning and an ineradicable tendency to say what is not true; and that it is as natural for them to make use of dissimulation on every occasion as it is for beasts to employ their means of defense when they are attacked. But it was remarked by Chancellor Zabriskie of New Jersey as not unnatural that weak and ignorant men should resort to falsehood as a protection against adversaries of superior knowledge and sagacity. Schopenhauer also said that a perjury in a court of justice is more often committed by women than by men, and that it may, indeed, be generally questioned whether women ought to be sworn at all. Like the unenlightened observers of the epileptic and the insane in former days, he ascribed women's actual shortcomings, physical and intellectual, to fundamental and innate characteristics. . . . Spencer, who found his data in England, advances reasons for believing that the physical and mental infirmities of women are the outcome of environment and heredity, not of fundamental differences based on sex. Darwin expressed the same opinion, which he placed upon a strictly scientific basis. Mascardus said: "Feminis plerumque omnino non creditur, et id dumtaxat, quod sunt feminae, quæ ut plurimum solent esse fraudulentæ, fallaces, et dolosæ."

Believe a woman or an epitaph;
Or any other thing that's false.

BYRON, "English Bards and Scotch Reviewers."

Have Women Peculiar Traits that affect Their Testimony? They have, if we are to believe the striking utterances of Mr. Justice Wayne, of the United States Supreme Court, who said: "The distinguished Sherlock says, without any satirical intention or meaning to say that women are inferior to men, 'Whilst she trusts her instinct she is scarcely ever deceived, and she is generally lost when she begins to reason.' And I need not tell my brethren, as evidence rests upon our faith in human testimony as sanctioned by experience, that the conclusion of the great divine is that of the law, and that the testimony of women is weighed with caution and allowances for them differently from that of men." Mr. Train says: "Women in the witness chair . . . are prone to swear to circumstances as facts, of their own knowledge, simply because they confuse what they have really observed with what they believe did occur or should have occurred, or with what they are convinced did happen simply because it was accustomed to happen in the past."

If the foregoing observations in pais, so to speak, of Sherlock, Mr. Justice Wayne, and Mr. Train are sound, we ought to find some confirmation of them among the immense number of reported opinions of judges of courts of first instance in the last hundred years. The author of this work has read all of the reported opinions of Sir John Nicholl, Dr. Lushington, Sir William Scott (Lord Stowell), and others who sat as the sole triers of facts in the old English ecclesiastical courts; every opinion in all of the New Jersey Equity and Law reports, the former especially enriched by the utterances of Chancellors Zabriskie, Williamson, Magie, and McGill, and of Vice Chancellors Van Fleet and Pitney, on the weight of testimony in cases decided by them in the exercise of the "one-man power"; nearly all the opinions ever delivered by a federal judge, particularly in chancery cases; and tens of thousands of other opinions by United States, Canadian, and English judges. With his attention alert to notice any judicial expression derogatory to the testimony of any class of witnesses, the author certifies that he has not seen a single allusion to constitutional limitations of women as trustworthy witnesses, and most of the judges above named were much in the habit of philosophizing on the characteristics of witnesses of various sorts and conditions — children, youths, aged persons, negroes, orientals, sailors, etc. The "distinguished Sherlock," whose specious statement was indorsed by Justice Wayne — and whose laudation of the female instinct is flatly contradicted by judicial experience in at least one important particular — lived in a period when male witnesses' "inferences," devoured by male juries and judges, were sending witches to a dreadful doom. Judges nowadays, as well as the professional psychologists, are fully aware that all human beings are prone to do exactly what Mr. Train, as above quoted, attributes especially to women, namely, to substitute inference for recollection. This vice and kindred aberrations are not peculiar to women, according to a great number of reported cases.

. SUB-TITLE D: MENTAL DISEASE

191. G. F. ARNOLD. *Psychology applied to Legal Evidence.* (1906. pp. 283, 296, 318.) . . . The importance of insanity in law is manifold: it raises the question whether a criminal is to be held responsible or not for some lawless act, whether a witness is competent to give evidence, whether a party is qualified to contract, whether a partnership or agency is terminated, and other similar points. . . . At the outset some general features of insanity will be noted. The effect of mental disease is in general to substitute for the complex balanced system of psychical forces which we have in health, a comparatively simple state of things in which certain tendencies grow abnormally strong and predominant through the suppression of others. More particularly, the higher and later acquired forms of psychosis, regulative processes of ideation, and self-control generally, tend to be dissolved, leaving the earlier and more instinctive tendencies uncontrolled. Thus through the weakening of the regulative volitional factor the patient is unable to control his ideas, and his intelligence is wrecked: or he becomes a prey to unregulated emotion, as where overweening conceit, timidity, or animosity becomes predominant, and helps to maintain corresponding mental illusions. We draw attention to the fact, for reasons that will appear later, that stress is here laid on the weakening of the volitional factor, and this feature again appears as the explanation of the crowd of associations of ideas which run riot in the insane mind. "If there is any single criterion of mental derangement," says Wundt, "it is this — that logical thought and the voluntary activity of the constructive imagination give way to the incoherent play of multifarious associations." He attributes the purposeless vacillation of the insane and the manner in which they express their thoughts to a lack of voluntary control over the unruly associations, and says that it is in this very mobility of association that the germ of decay is to be looked for. . . .

Let us now briefly gather up the results of this discussion. There are no such things as cognitive faculties existing apart from the emotions and the will, nor can our cognitive processes be separated off from our emo-

tional and volitional ones, except for the purposes of study and exposition. These mental states are interconnected and occur together in one total state of consciousness, and states of consciousness are bound together by the existence of the organism. All ultimately depend on that, but the emotional states do so more directly than the intellectual ones, and it is our emotions which have the preponderating influence in the whole psychological complex which represents the mind at any time. They guide the intellect and direct it, and the latter cannot make decisions in opposition to them on purely intellectual grounds. It follows from this that the emotions and the will cannot be affected without also affecting our cognition, and delusions, illusions, etc., and what are generally known as derangements of the intellect can be traced to, and, in fact, explained as, the products of perversion of the emotions and affection of the organic sensations. . . . As, for the reasons already given, the close interconnection of the cognitive, emotional, and volitional processes is established, if the affection of any one of them is proved it ought to be presumed that the others are also affected until those who assert in the contrary prove their view to be correct. . . .

To the popular mind, fixed ideas and delusions are very frequently signs of madness, but neither are necessarily so. Delusions are false opinions about a matter of fact and sometimes do and sometimes do not involve false perceptions of sensible things. In the case of the insane they are apt to affect certain typical forms hard to explain: in many instances they are theories which the patients invent to account for their abnormal bodily sensations; in other cases they are due to hallucinations of hearing and sight. . . . Fixed ideas always coincide with an advanced stage of mental disease though they often are not a form of insanity in the legal sense. They may be merely a diseased excrescence which does not suppose a total transformation of the individual. There are practically three classes of them, viz.: (1) simple fixed ideas of a purely intellectual nature; (2) fixed ideas accompanied by emotions, such as terror and agony, the insanity of doubt; and (3) fixed ideas of an impulsive form. These last manifest themselves in violent or criminal acts, such as suicide and homicide and are the only kind that should be held to indicate irresponsibility in law. They are, in fact, in such cases the irresistible tendencies already alluded to.¹ Speaking of fixed ideas in general, Ribot says that they are a symptom of degeneration and the persons who have them are not therefore insane. . . . He also shows how the mechanism of the fixed idea resembles that of ordinary attention: there is no difference of kind, but only of degree. The fixed idea has a greater intensity and a longer duration, but if a state of spontaneous attention were similarly strengthened and rendered permanent, the whole array of irrational conceptions that form the retinue and present a fictitious appearance of insanity would of necessity be added to it as the mere result of the logical mechanism of the mind. At the same time the fixed idea presupposes a considerable weakening of the will, that is, of the power to react. When a man possessed by a fixed idea is merely a witness who has to give evidence, his evidence will be accepted on other points than that to which the fixed idea relates. At least this is the case of the monomaniac, concerning whom it has been

¹ Ribot on *Attention*, pp. 78-79.

so laid down, and who is termed in the law decisions "partially insane." This agrees with the view of Ribot already quoted that a fixed idea is often only a diseased excrescence which does not suppose a total transformation of the individual. . . .

There remain for consideration lucid intervals in insanity, and idiocy. "The idiot," it is said [by a law writer], "can never become rational; but a lunatic may entirely recover or have lucid intervals; . . . thus a lunatic during a lucid interval may be examined." . . . [This statement is correct enough as to the lunatic.] There is no permanently existing diseased self which appears and disappears at intervals, and thus may infect the intervening period during which the subject is apparently sound; but the preponderating state of consciousness at each moment constitutes to the individual and to others his personality. . . . But that the idiot can never become rational is perhaps too sweeping a statement: it ignores the fact that there are degrees of the state. "Idiocy has various degrees from complete nullity of intelligence to simple weak-mindedness, according to the point at which arrest of development has taken place." At the same time it is true that when the idiot is one whose brain does not contain the whole cerebral mass you cannot create it (though in the case of the young where it has been due to some malformation which has prevented the brain from developing, removal of the cause will lead to improvement). To educate imbeciles and idiots is extremely difficult, because they are bereft of the faculty of attention; the system is to make use of those senses which fulfill their function in order to develop those which do not, and after a long course of training "it becomes possible to raise the idiot more or less near to the level of ordinary perceptual consciousness." It has sometimes been remarked that persons of this type are particularly trustworthy as messengers and in carrying out instructions, if you can once get into their heads what it is they are required to do: this is due to their narrow range of interests and the resulting absence of distracting considerations. For the same reason they sometimes show unusual powers of memory; they recall remarkable series of objects contiguous in time and space because there are no other divergent lines of association to compete with those which are formed by the mere sequence of external impressions. To systematically distrust the idiot as a witness would therefore be an error: within the limits of his observation he may be expected to be particularly correct in his account of occurrences.

There is said to be a presumption in law that insanity which has been once established will continue, and that the burden of proof of a subsequent lucid interval lies on the party who asserts it. This is based on another general presumption that things generally remain the same, including persons, personal relations, states of things, individual's opinions and states of mind. It is not supposed that such a presumption really weighs very much, but we cannot refrain from remarking that the value of it is simply nil: it is mere prejudice, and, as Mr. Bradley says, "the general disposition to believe that what has been is, or that what is usually is always, cannot seriously be offered as a conclusive argument." . . . The fact appears to be that no general presumption can be drawn concerning the continuance or non-continuance of insanity: it is possible to draw presumptions from the symptoms of certain kinds, because these indicate that the madness is

an incipient stage of a form that never disappears but continues to progress. As, however, some forms are only periodic and in others recovery is usually certain, unless other causes supervene, to presume here that the insanity will continue is mere error.

192. CHARLES MERCIER. *Sanity and Insanity*. (1895. p. 382.) Different cases of mania differ from one another, however, in other respects besides the violence of the maniacal manifestations. The variety in the manifestations is almost infinite. It is a very common supposition among the laity that every madman entertains a delusion, and the existence of a delusion is regarded as the essence, the criterion, and the test of insanity. It will be apparent, to every reader who has got thus far, that this is by no means the case. In point of fact, the lunatics who entertain delusions are in a minority, and not a very large minority, of the whole number. In dementia, which is unquestionable insanity — unquestionable failure of the process of adjustment of self to surroundings — there is commonly no delusion. There is merely a weakening, degradation, and narrowing of mind, so that the patient becomes incompetent to manage himself and his affairs, simply because he is no longer able to appreciate and understand his affairs, or to estimate truly his own wants. In that modification of dementia which we call mania, there may be no delusion. . . . The lunatic is still able to get about, to run, to walk, to play cricket, to ply his trade; but the more elaborate nervous arrangements, which actuate the higher phases of his conduct, being disordered, he cannot effect these higher phases of conduct normally. It does not necessarily follow that his mind is distorted and his conduct biased by delusion. There may be simply mental enfeeblement, that is to say, the higher processes of his mind are bemuddled. When he attempts to think out an elaborate course of conduct, he falls into a state of confusion. When he attempts to carry out an elaborate course, he gets astray, he does things wrong, he makes mistakes, he fails to appreciate the force, and to estimate the comparative value of circumstances, and his acts are wrongly directed, confused, and muddled; but throughout it all, there is none of that definite distortion of mind that we call delusion. We cannot lay a finger upon any one point and say, "This is a delusive belief; that is a delusive idea." We can only find a general state of mist and fog and bemuddlement. We find vague expressions of confusion, but no definite, sharp-cut, fixed belief, that we can call a delusion.

Consider such an utterance as the following, taken from a letter that I received this morning: "Knowing the only chance to escape from such awful nuisance for ages of delusions besides all ladies' honor concerned for upon that marriage of Lamb had depended triumph of faith crave happiness just had been heartless way preventing such deluded ladies to have such picture in their reach all cry shame were such revealed the scores in Bible which shall bring that marriage seen Messiah's Kingdom teach woman's heart that divine love." It is insane enough; but it exhibits no definite delusion. It is a farrago of incoherent nonsense. The erroneous ideas that are prevalent with regard to the mental operations of the insane depend largely, of course, upon ignorance, but largely also upon want of the dramatic faculty — want of the capacity to take upon one's self, as it were, another person's individuality, and realize vicariously their mental condi-

tion. The person who wrote the passage given above does not entertain any delusion. The lower strata of his highest nerve regions are in good order. So long as he is dealing with concrete facts he is not only sane, but clever. He is a capable artisan, a skillful fly-fisher, a good shot, a brilliant billiard player, and a good chess player. For all these concrete employments his mind works well and clearly. But when he tries to deal with abstractions; when he tries to bring into operation the highest faculties of his mind; the highest strata of his brain; he falls at once into confusion. The truth is that the highest strata of his brain are seriously and permanently damaged, and that, although he can set to work the fragmentary remains of them, they can no more turn out a complete and coherent piece of work, than can a blunted chisel cut a clean groove in wood, or a damaged loom weave a fair piece of cloth. With the damaged chisel you may cut a groove — of a kind; and from the damaged loom you may get cloth — of a sort; and from the damaged nerve centers you may get conduct — of some description. . . .

The characters of the delusions that are entertained by insane people are almost infinitely various, there being only one class of circumstances to which they never refer, viz. circumstances unconnected with the deluded person. Insanity being disorder of the adjustment of self to surroundings, it is evident that delusion which is a part of insanity must implicate self. There are an almost infinite variety of delusions, but we never find a delusion which refers wholly to outside circumstances, and has no reference to self. A man will entertain the belief that he is Emperor of China, but he will never entertain the belief that another person is Emperor of China, except he believe that the person so exalted gains by his exaltation a power of interfering in some way with the deluded person himself. Maclean, who was tried for high treason in 1882, had a delusion that almost everybody was dressed in blue, but he also believed that they dressed in this color in order to annoy him.

Delusions fall naturally into three classes: Delusions of self; delusions of the relation of self to surroundings; and delusions of the relation of surroundings to self. The first class we have already dealt with; the remaining classes, which depend on alterations of the other moiety of the nervous circulation, have also been dealt with in part. . . . All the delusions of self and of the relation of self to surroundings have this feature in common — that the conduct to which they prompt is very rarely directly hurtful to others. They often prompt to direct injury to self, and to suicide, but only rarely to injury to others. In the third class of delusions the alteration is in the relation in which circumstances are believed to stand to self. The difference between the delusions of this class and those of the last is very distinct. In the delusions of the class just considered, the alteration is in the way that the self acts, has acted, or may act on his surroundings. The delusions of the present class are concerned with the way in which circumstances act on self. The peculiarity of these delusions is, that the action of circumstances, to which the delusion refers, is almost always considered to be unfavorable. Persons with delusions of this character are the objects of fancied machinations and conspiracies. Their wives and children are endeavoring to injure them; people are laughing at them, talking, whispering, thinking about them. People are thinking their thoughts, controlling their thoughts,

putting vile ideas into their minds; speaking to them, or acting on them, or influencing their minds from great distances, in occult ways, by mesmerism, by electricity, by telephones, by wires, through the gas, the water, the air, the sunlight. People are in a conspiracy against them. Spirits are influencing them, working upon them, playing upon them. People follow them about, point at them, and whisper about them. Or they are tormented by spirits. Horrible suggestions and promptings are made to them. They hear voices or see writing reviling them, or commanding or suggesting to them to do this or that. They are persecuted; the police are after them, they are to be tried, hanged, burnt, boiled in oil, roasted alive, starved, disemboweled. They have been robbed, swindled, cheated. Their wives are unfaithful; their children, relatives, friends, acquaintances — the whole world is in one vast conspiracy to do them harm.

Delusions of this third class differ from those of the two preceding classes in the fact that they are very prone to prompt to conduct that is dangerous to others. From the belief that one is being injured, to the attempt to retaliate upon the injurer, is but a very short step; and as the injurious agency is readily shifted in imagination from one person to another, the ill deeds may be ascribed to any one whomsoever. Oftenest they are ascribed to relatives, friends, or acquaintances — to people who have a direct relation of proximity to the patient. Not seldom the injurious agency is ascribed to some prominent personage — to the Queen, the Prime Minister, to a judge, or a local magnate. Occasionally the attempt at retaliation is made against an entire stranger, one who is unknown to, and has never been seen before by, the insane person. Lunatics who entertain delusions of this character are never safe to be at large. The commission of some deed of violence by them is a matter simply of time, and sooner or later they are sure to become dangerous.

It is not merely by direct retaliation that such persons become dangerous. It is common for them to commit some deed of violence on a person in prominent position, for the purpose of drawing attention to their grievances, with the vague idea that, once attention is drawn to them, they will be remedied. Such persons have commonly wearied out the patience of their friends by their continual complaints, which, at first combated and reasoned against, are at last regarded with indifference, and passed by as a matter of course. This kind of demeanor towards a person who is subject to delusions of this character does not answer. To him his grievances are very real, and his sufferings very painful. When he finds that his complaints are habitually disregarded and ignored, he will seek some method of prominently bringing them before the public eye and compelling attention to them. Commonly he has carried his complaints before some public official. He has invoked the assistance of the police against his persecutors; if a soldier, he has demanded redress from the commander in chief. He has applied to minister after minister, official after official, and all his complaints have been disregarded. . . . It was on this motive that the Queen was shot at by Maclean; that the Master of the Rolls was shot at by Dodswell; that President Carnot was shot at by Perrin; and many other instances will present themselves to the memory of my readers. . . .

The character of the delusions that an insane person entertains depends in part upon the area and nature of the nervous strata which have been

removed, or rather upon the character of those which remain. . . . The general features of the delusion being thus determined, its individuality will be settled, in part by nature of the person in whom it occurs, his history and experience; and in part by impressions made upon him by passing events. Thus a person who is naturally suspicious will have his suspicions morbidly exaggerated; a person who is naturally vain of the impressions he makes on the opposite sex will believe that he is persecuted by their attentions: a person who is naturally religious will believe himself the direct depositary of the commands of the Deity. . . . The impressions made by passing events will frequently give color to a delusion. In the case of a man who believes that this or that eminent person exercises influence for good or evil over him, the particular person to whom the influence will be ascribed is the one who is at the moment most prominently before the world. A series of political speeches reported in the papers will lead to the ascription of the influence to the leading political orators. . . . The description of a new invention in the newspapers will determine delusions to the telephone, the microphone, the phonograph, the electric light machine, and so forth.

Important as delusions undoubtedly are, as manifestations of insanity, let me, however, again impress upon the reader that the existence of a delusion is by no means of universal or regular occurrence, but that on the contrary, in the majority of cases of insanity no definite delusion exists. In the majority of cases the condition of the mind is one of enfeeblement or of confusion; and this condition of enfeeblement or confusion may extend throughout all the mental operations, or may affect only a restricted and elevated portion of them. It may be conspicuously prominent at all times, or it may at some times be imperceptible, at others elicitable, and at others manifest. While it is easy, upon evidence, to come to the conclusion that a person is insane, it is extremely fallacious and dangerous, from the absence of such evidence, to conclude that a person is sane. If there has arisen, within any recent period, *prima facie* reason to think that a person is insane, no prudent man will venture, upon a single interview, to pronounce positively that that opinion was not justified by the facts.

193. HANS GROSS. *Criminal Investigation*. (transl. Adam, 1907, p. 171.) . . . Certain people afflicted with mental troubles are very fond of writing: especially when misanthropic they are prone to substitute letters or petitions for personal interviews. Moreover, people suffering from the monomania of persecution are particularly fond of appearing before the courts, believing they are safest there. We have all had experience of habitués among this latter class of unfortunate madmen who come from time to time to seek news of their suit, legacy, fortune, etc. It sometimes happens that these persons will on no account appear before the court for fear of being shut up, deceived, or even executed; they prefer to make their accusations in writing. Such accusations of imaginary crimes come before every court and cause most disagreeable confusion, when, led astray by apparently perfectly reasonable explanations, cases are rashly taken up against the parties accused. . . .

But all that an insane person may say or write is not always devoid of truth or inaccurate, and *every accusation, even coming from a person notoriously mad, is worthy of examination*. It only too often happens that

people profit by the circumstances of an individual's madness to say "all the same, no one will believe that madman." If this be so, the unfortunate lunatic is at the mercy of the whole world and exposed to the exploitation, teasing, and bad treatment of ill-conditioned and ill-minded people, especially when they find out that their victim's repeated complaints have not been believed. It is therefore the duty of the Investigating Officer to verify the accuracy of all the statements of a lunatic; on every occasion he should make sure that there is really no truth in the case, even where the evil complained of has been found on previous occasions to be false. We remember a case in which a crazy old peasant had made innumerable representations to the authorities in which he declared that, "his enemy" had made, before his house or on his way, pits, traps, and similar contrivances, by which he would be killed or injured. Many of these representations were furnished with clear sketches of the asserted pitfalls, etc. These representations became known to the people of the neighborhood and on one occasion the village boys played a practical joke and really made a pit before his front door and filled it with manure. The unfortunate man fell right into it and was nearly drowned. . . .

It is often necessary to cite lunatics as witnesses; they should never be sent away merely on the ground that they are demented, for they can sometimes render considerable assistance. It has been frequently remarked that madmen, especially certain varieties of madmen, are excellent observers. They are not nearly so adverse to telling the truth as many people who rejoice in all their faculties, for they do not allow themselves to be guided by considerations of propriety. They have also more opportunities for observation, for things are done and said in the presence of a lunatic which would not be done or said before others. But it is self-evident that the statements of a madman must be well weighed before being utilized as evidence in a case.

194. **REGINA v. HILL.** (1851. 5 Cox Cr. 259, 2 Den. & P. 254.)

. . . This prisoner was tried before COLERIDGE, J., assisted by CRESSWELL, J., at the February sittings of the Central Criminal Court, 1851, for the manslaughter of Moses James Barnes. He was convicted; but a question was reserved for the opinion of this court, as to the propriety of having admitted a witness of the name of Richard Donelly, on the part of the prosecution. The deceased and the witness were both lunatic patients in a Mr. Armstrong's Asylum, at Camberwell, at the time of the supposed injury, and they were, at that time, placed in a ward called the Infirmary. It appeared that a single sane attendant (the prisoner) had the charge of this ward, in which as many as nine patients slept, and that he was

assisted by three of the patients, of whom the witness Donelly was one. It was opened for the prosecution, that the witness Donelly was to be called, and, therefore, on both sides, some evidence was gone into in the course of the case, before he was called, in order to found and to meet the objection to his competency.

Muncaster, who had been an attendant in charge of the infirmary ward before the prisoner, stated: "Donelly labors under the delusion that he has a number of spirits about him which are continually talking to him; that is his only delusion; he has never been free from it, to my knowledge, since I have known him."

Joseph Stuart Burton, the medical

superintendent, stated the same; but added, "I believe him to be quite capable of giving an account of any transaction that happened before his eyes. I have always found him so; it is solely with reference to the delusion about spirits, that I attribute to him being a lunatic: when I have had conversation with him on ordinary subjects, I have found him perfectly rational, but for this delusion; I have seen nothing in his conduct or demeanor in answering questions, otherwise than the demeanor of a sane man."

James Hill, a doctor in medicine, who had been formerly a medical superintendent at the same Asylum, stated: "The memory of an insane man is not necessarily affected; it frequently is, but frequently is not. I have seen Dr. Haslam's work. I do not agree in all cases with his remark that 'memory appears to be perfectly defective in cases of insanity,' — certainly not; it may probably be so in the generality of cases. Madness is commonly accompanied by a great deal of excitability of the brain, but in some cases it is not; it is very often accompanied by physical irritation of the brain; it is one of the most common causes of madness, either primarily or secondarily. In certain cases of acute madness, the ideas in the mind of a madman succeed each other more rapidly than in the mind of a sane man, and in a more confused manner, that is, where there is actual irritation of the brain; it is quite possible for a man to entertain a delusion on one subject without its affecting his mind generally on other subjects; in most cases where a delusion prevails, and the man is mad, the rest of his mind is affected to some extent. I agree with Dr. Pritchard in his observation, that 'In monomania, the mind is unsound, but unsound in one point only.' There is no doubt, however, that all the mental faculties are more or less affected; but the affection is more

strongly manifested in some than in others. It is difficult to ascertain, without strict inquiry, the extent of a madman's delusions; they have sometimes the power of concealing their delusions, even from their medical attendants, especially after having been frequently conversed with about the delusions, and knowing that they are the cause of their detention, — but it is unfrequent. It is a doubtful point whether what they say is not for a particular purpose, — for instance, to obtain liberty. If a madman has an object to answer, he is sometimes capable of concealing his delusions; I have known it, but not as a general rule: they are probably capable of a good deal of dissimulation, — many are, I know; but many do not exhibit that tendency. It is common for a certain class of madmen to exhibit a great deal of cunning. *Donnelly* labored under a delusion with respect to spirits; he is in the strict sense of the word, a lunatic, inasmuch as he labors under a delusion; he is not excitable by any means. I have known instances of lunatics concealing their delusions, but in all these cases there is an evident and apparent motive. I have known decided lunatics, not monomaniacs, in what are called lucid intervals, capable of going about and managing their own affairs; in ordinary cases there is no particular difference between a monomaniac, apart from his particular delusion, and an insane person in a lucid interval; during the lucid interval of the insane person, he is well; but a monomaniac is a monomaniac all the time. In the instance of a monomaniac, you produce the insanity the moment you touch the particular chord. It is possible that you might revive insanity in a madman during a lucid interval by touching on the same subject, if it is but recent. I always found *Donnelly* perfectly rational except on the subject of his particular delusion."

Donelly was then called and before being sworn, was examined by the prisoner's counsel. He said, "I am fully aware that I have a spirit, and twenty thousand of them; they are not all mine; I must inquire — I can where I am; I know which are mine. Those ascend from my stomach to my head, and also those in my ears; I don't know how many there are. The flesh creates spirits by the palpitation of the nerves and the 'rheumatics'; all are now in my body and round my head; they speak to me incessantly, — particularly at night. That spirits are immortal I am taught by my religion from my childhood, no matter how faith goes: all live after my death, those that belong to me and those which do not; Satan lives after my death, so does the Living God." After more of this kind, he added, "They speak to me constantly; they are now speaking to me; they are not separate from me; they are round me, speaking to me now; but I can't be a spirit, for I am flesh and blood; they can go in and out through walls and places which I cannot. I go to the grave, they live hereafter, — unless, indeed, I've a gift different from my father and mother that I don't know. After death my spirit will ascend to Heaven or remain in Purgatory. I can prove Purgatory. I am a Roman Catholic; I attended Moorfields, Chelsea

Chapel, and many other chapels round London. I believe Purgatory; I was taught that in my childhood and infancy. I know what it is to take an oath; my Catechism taught me from my infancy when it is lawful to swear; it is when God's honor, our own or our neighbor's good require it. When man swears, he does it in justifying his neighbor on a Prayer Book or obligation. My ability evades while I am speaking, for the spirit ascends to my head. When I swear, I appeal to the Almighty; it is perjury the breaking a lawful oath or taking an unlawful one; he that does it will go to hell for all eternity."

He was then sworn and gave a perfectly connected and rational account of a transaction which he reported himself to have witnessed. He was in some doubt as to the day of the week on which it took place, and on cross-examination said, "These creatures insist upon it it was Tuesday night, and I think it was Monday;" whereupon he was asked, "Is what you have told us what the spirits told you, or what you recollect without the spirit?" and he said, "No; the spirits assist me in speaking of the date; I thought it was Monday, and they told me it was Christmas Eve — Tuesday; but I was an eyewitness, an ocular witness to the fall to the ground."

195. COLONEL KING'S CASE (G. O. Waite, *Three Years with Counterfeiters, Smugglers, and Boodle Carriers*. 1876. p. 174.)

The following exciting incidents took place late in the year 1869, and were the occasion of very serious alarm; promising for a few days to develop one of the most important and revolting conspiracies ever plotted on this side of the Atlantic, and causing the most intense excitement in certain circles, for the nonce. The plot had apparently for its object (through the efforts of leading restless spirits secretly associated

together) the absolute repudiation of the National debt, and the utter overthrow of the Republican Government! . . .

An ex-Confederate officer, who had served with creditable valor in the late rebellion — on the wrong side, however — by name and title "Colonel Huston King, of the Kentucky Artillery," appeared one day in December, 1869, in the city of Washington, before U. S. Commis-

sioner James Blackburn, and confidentially made oath to the following extraordinary and astounding declarations, to wit: "I, Huston King, being duly sworn, do depose and say that I am a resident of Elliot County, Kentucky, and by occupation Clerk of the Circuit Court of said County. I was Colonel of Artillery in the Confederate Army, and in the month of December, 1865, went from New Orleans to New York, by steamer, and upon this passage, met with Harlow J. Phelps, merchant of New Orleans. Phelps represented that he was bound to New York, to be present at the secret organization of a repudiating party, looking to the repudiation of the national debt. Upon arriving in New York, Phelps and myself met some two hundred men from all sections of the country, south and north; and this party was organized, and commenced operations. H. J. Sneed, of St. Louis, was chosen President, and A. H. Sinclair, of New York, Secretary. The initiation fee was \$150, and the total capital to be raised was \$500,000; and this amount was raised in four days. This money was to be used to obtain the genuine U. S. Government plates for printing legal tender notes. The plates were so obtained, and \$60,000,000 were represented to me as having been printed from these plates. I have received \$500 of this issue already, myself, and about \$20,000,000 of this sum has been put upon the country. With this fund, the genuine plates have been secured, for making legal tender notes, bonds, and national bank notes. Of these we issued the full amount of the national debt of the country. Only about four millions have as yet been put in circulation. The plates are partly in Canada, Montreal, and part are in New York. There was a reorganization of this party on the 1st and 2d of November, in 1869, in New York City, at which I was present, when Frank P. Blair,

of Missouri, was chosen President, with power to appoint a Secretary. The original stockholders numbered four hundred. The number, now, greatly exceeds this. I am the Agent for the 9th Congressional District of Kentucky. I have perfected branch organizations in every County in said District. . . . I give this information voluntarily, and solely for the benefit of the Government. (Signed) Huston King." This affidavit was duly subscribed and sworn to before Judge Blackburn, and attested by three witnesses in his presence, according to law. This precise and curiously explicit document had found its way into the hands of a Western Revenue Detective by the name of Hogeland, and he deemed it of sufficient consequence to go about the unraveling of the mystery which seemed to surround the strange proceedings, with the most earnest application, as in duty bound. . . .

Colonel King's excellent military reputation in Kentucky was assured by authority, and he had actually been recommended for promotion by such Confederate notables as Generals Robt. E. Lee and Stonewall Jackson; the evidences of which he produced in the handwriting of those distinguished secesh officials. He was backed by a very able and consistent lawyer, too, who came all the way from Greenup Co., Kentucky, personally to indorse the Colonel, in the strongest terms that language could frame. Some time previously, the Government at Washington had had an intimation that certain legal tender and bond plates had been taken from the Department, surreptitiously, and \$1000 counterfeit 7.30 notes had found their way back into the Treasury — where they were promptly condemned. This fact, taken in connection with the seemingly frank and well-supported statements of the repentant and gallant Colonel, gave color alike to the genuineness of his good faith

and the accuracy of his accounts relating to this conspiracy. The Greenupsburg lawyer, Mr. L. J. Filston, who accompanied Colonel King, was quite as earnest (perhaps more so) as was the Colonel himself; and he did not fail, not only in the most anxious terms to indorse him, but to express his own personal alarm at the threatening prospect, repeatedly, to the authorities. . . .

The Western Detective (Hogeland) who undertook to "work up" this case, was confident that he had "a big thing" on hand, and he threw himself with unwonted energy and seriousness into this job. . . . But first it was necessary to lay the outrageous particulars of the conception of this destructive scheme before the Washington authorities. And so the three earnest men repaired direct to the Treasury Department, to unbosom themselves, as we have already stated. Judge Wm. A. Richardson, of Massachusetts, chanced to be Acting Secretary of the Treasury at this hour. This gentleman is a shrewd, intelligent, sound-minded, level-headed lawyer, whose long experience on the judicial bench has afforded him ample opportunity to become a rare good judge of human nature, in a great variety of phases; and he is not easily moved or thrown out of bias by ordinary tales of wonder. He patiently listened to the mysterious tale of horrors which his three earnest visitors had to communicate, and then civilly but promptly referred the gentlemen (whose eyes stuck out of their heads in wonder at the Judge's coolness and indifference) to Solicitor Banfield, of the Treasury Department. Here the three men "told o'er their wondrous story" once again; and the polite but incredulous Attorney for this Department of Government closed an eye, looked cautiously at the countenances of his excited visitors, and intimating that he did not see any occasion for hurrying in this business — quietly turned the

trio over to the Chief of the Secret Service, Col. Whitley, at New York City. . . .

Chief Whitley is not readily excited, and very rarely goes off into tantrums. . . . "There are two hundred men in buckram, you say, concerned in this foul scheme, Colonel?" asked the Chief. "Oh, more than that — quite twice that number, sir," said King. "And these two hundred men and more, have kept this infernal plot a profound secret for so many months, too?" added the Chief, doubtingly. "Ah, Colonel, remember the terrible series of shocking oaths they took never to divulge the secret of the clan. . . . You see, Chief," continued King, "I'm a doomed man, if I am suspected by these wretches. A thousand daggers would be aimed at my heart, within the hour of the discovery that I had 'peached' upon them. For God's sake, move cautiously. . . . I now intend at once to call upon half a hundred of the leading wretches in this city; and will report to you, to-morrow, the exact status of affairs, to enable you to act promptly, and add to your already well-earned crown of professional laurels the brightest leaf that will ever find a place in the wreath!" . . .

Colonel Whitley felt it incumbent on him to insist upon his accepting the use of a carriage, at the Chief's expense, in which to make these numerous calls he now contemplated. This offer of Col. Whitley was thankfully accepted; and half an hour afterwards, Colonel King was driven away in a nice hack, to wait upon the half a hundred leading conspirators (more or less) who resided in an around New York. . . . The Chief took the trifling precaution (in this last arrangement) to place upon the carriage box one of his own trusty Detectives, Mr. Wm. W. Applegate, in the capacity of driver of the vehicle. This operative was appropriately disguised for the occasion, and a more

accomplished whip never drew rein over a spunky pair o' cattle.

At evening, the Detective returned to report, and recounted to his Chief the fact that he had driven Colonel King all over Gotham, from City Hall to the Croton Aqueduct, and thence to Greenwood Cemetery and back; but ne'er a call had he made upon any *one* (not to speak of "half a hundred") of the conspirators he had prated so loudly about in the morning! "I am not surprised," said the Chief, quietly. "I never took any stock in this tale of horror." "It is a very singular affair, nevertheless," suggested his Assistant, respectfully. "This man is backed by almost incontrovertible proof of his sincerity. The lawyer, the Western Treasury Agent, the documents, the by-laws of the clan, the reputation of Colonel King himself," etc. "I see it all. And this is my judgment," concluded Colonel Whitley, "formed at my first interview with these three men, and still unchanged. This King is either the cursedest liar that ever drew breath, or he is the craziest devil out of Bedlam!" . . .

Shortly afterwards Colonel King himself came in, to inform the Chief, in answer to his query as to whether he had found his associates of the "Circle," that "he had seen about a hundred of them, during his ride that day. And not one of them dreamed that he had sold them out to the U. S. Government." King then sat down and deliberately wrote a score of letters to friends in Kentucky (imaginary friends, perhaps) informing them of the course he "had seen fit to take, for his country's good," concluding these epistles with the assurance that he had been rewarded by the Government with a gift of a million of dollars for the disclosures he had made, and that he would divide this plunder with them, on his return home, which would occur very shortly, etc. By means of this performance, Col. Whitley, who

watched him, obtained a knowledge of the style of King's handwriting. . . .

"This thing will keep," said Whitley to his aids. "Have an eye on this man. He'll shortly reach the end of his tether."

Within two days, the ever attentive and anxious attorney, Filtson, rushed suddenly into the Chief's presence, in a frenzied state of excitement. "Just as I feared, Colonel!" he said, spasmodically. "Poor fellow. King's gone up! A martyr to his loyalty. It's just like him. The 'Knights' are after him! Our affair is exploded, and poor King is doomed. They'll clean him out, sure, and his well-intentioned and loyal efforts to serve his country will send him up the spout, alas! See, Colonel! They've been thrusting these threatening letters under the door of his hotel room all day long. He dare not quit his apartment. He is a goner, sure!" In the adjoining room at Col. Whitley's headquarters, sat the Chief's Assistant, the jolly, portly Nettleship, who was quietly smoking his Habana, and looking over some of the "important" documents connected with this singular case, when Whitley summoned him. They started off directly for King's hotel, and soon afterwards discovered that gentleman, in a frightful mental condition, within his own apartment. "What's the trouble with you, now?" inquired the Chief, as he entered, flanked by the facetious Nettleship. "Gone up," screamed King. "It's all over! The thing is out — the Knights have discovered my attempt to tell their story — and I'm a dead man, ere the sun shines on this blessed earth again. I can't escape them. They're here, there, everywhere. And I'm a goner! Look," he continued. "Read these letters, shoved beneath my door, here, by the score. Read, Colonel!" and the terribly excited man exhibited a handful of missives emblazoned with daggers, crossbones, death's-heads, coffins,

chains, and other mystic signs of the horrid Order of the "K. G. C." which really looked (at first sight) as if the entire "Union Greenback Brotherhood of Repudiators and Scalliwags" had simultaneously started for him, without a compunction; that he would very shortly "be slaughtered and quartered, and that his poor quivering, lifeless remains would then be scattered to the winds," in due accordance with the terms of the penalty prescribed in one of the gentlest of the Society's secret oaths!

The Chief glanced at the letters, at once recognized the handwriting of the missives, and then approached Colonel King, calmly, and placed his hand upon the ex-Confederate Colonel's forehead; where he just then discovered a long red scar, running from the upper edge of the frontal towards the parietal bone of the skull. "What's this, Colonel?" inquired the Chief, placing his finger upon the spot. "How'd you come by that scar?" "That's where a bullet from one of your Yank's rifles grazed my cranium, during the war," responded King, placing his own forefinger dubiously upon his head, and turning back the hair, carefully. "I see," said Whitley, "He's a lunatic. I said from the first, that he was either an infernal liar, or as mad as a March hare. It's so." "I reckon you're right, Colonel," replied his Assistant, gazing into King's troubled face. "Now," continued the Chief, sharply to the Confederate Colonel, "what do you mean by all this bosh? These letters here are every one of them in your own handwriting!

I know it. Do you take us all for idiots? You're crazy. And the sooner you're taken due care of, the better for yourself and your friends."

The Confederate lunatic — for such he really was — immediately "came down," and admitted the soft impeachment regarding the writing of the letters. He argued the matter of the existing plot, however, right sturdily, and was again backed by the eloquent Greenup lawyer. But it was too late, now, to push this thing further with Colonel Whitley. The Chief directly summoned Dr. Hammond, of Bellevue Hospital. The wild man from the West was duly examined, professionally, and the doctor unhesitatingly pronounced him insane — which proved to be the fact, although the lawyer and the Western Detective Hogeland had been so thoroughly blinded, through all his erratic course of conduct — from the very start — and had never once imagined that they had been toting round the country, and zealously sustaining an actual madman, amidst this singular but plausible freak of distorted fancy. King remained in New York some time under medical treatment. Lawyer Filtson put away, in deep chagrin, for his "old Kentucky home," content with having expended several hundred good round dollars of his own, in the attempt to gain a few thousand more, probably for his "disinterested services" in the enterprise he so foolishly embarked in, and so credulously followed up to the point of its explosion by the Chief of the Secret Service.

SUB-TITLE E: MORAL CHARACTER

196. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹ In determining the credit to be given to a witness, one question is, What kind of moral character bears most strongly on his trustworthiness? His *veracity*, or, as more commonly and more loosely put, his *character for truth*, must be, and is universally conceded to be, the immediate basis of inference. The chief topic of controversy here has been whether *bad moral character* in general, or some other *specific bad quality* in particular, is admissible.

The argument that bad moral character discredits a witness is, in brief, that it necessarily involves an impairment of the truth-telling capacity; that to show general moral degeneration is to show an inevitable degeneration in veracity; and that the former is often more easily betrayed to observation than is the latter. The following passages illustrate the various phrasings of the argument:

Bushnell's Trial. (1656. 5 How. St. Tr. 633, 701): *Bushnell*, arguing against a witness whose many infamies he had related: "But may some say 'that all this, however true, makes him no more than a thief or a robber of both God and man, or a plunderer, or a parricide, a profaner, or a drunkard, or the like; but now this doth not wholly disenable his testimony; but could I make it appear that he had formerly foresworn himself, then I had something to the purpose.' To this I shall answer . . . that we cannot prove it that those who bore false witness against Naboth did ever bear false witness against any before, but this it was that rendered them suspicious (and with just judges should have been cause enough to abhor them), because they were sons of Belial, wicked, mischievous lawless men, men of so much known infamy that they would not stick at anything which was put upon them, be it either to speak or to do, but in the general were ready for any wicked employment."

MARCY, Sen., in *Bakeman v. Rose*. (1837. 18 Wend. 146, 151): "That the credibility of a witness should be sought through his general moral character I have no doubt. . . . If the inquiry be confined to the general reputation of the witness in point of truth among his neighbors, it will happen in some cases that a witness whose general moral character is deservedly infamous is allowed to impress his testimony on the jury with unqualified weight, simply because mendacity may have been relatively too insignificant an item, in the catalogue of his vices, to have attracted the attention or elicited the remark of his acquaintance. Or it may happen that, though generally of so depraved or corrupt a life that no one would doubt the facility with which he might be suborned to swear falsely, yet from caution or calculation he may have observed that general veracity in his common intercourse, or from natural taciturnity a 'willful stillness entertained,' which would render his reputation impregnable to this form of inquiry. . . . One of the great benefits of jury trial was supposed to exist in the circumstance that the jury, being from the vicinage of the parties and the witnesses, were better able to judge of their relative honesty and credibility. It would seem, therefore, in accordance with this principle, that under the modern forms of impaneling juries, which do not in many cases afford to jurors the means of judging, from personal knowledge of the character of witnesses, the measure of credit to be given to them, that as liberal a course for supplying this deficiency of knowledge should be allowed as would be compatible with the rights of the witnesses."

The arguments made in answer to this are chiefly two: (1) that, as a matter of human nature, a bad general disposition does *not* necessarily or commonly involve a lack of veracity, and that therefore the former is of little or no help probatively; (2) that the estimate of an ordinary witness as to an-

¹ [Adapted from the same author's *Treatise on Evidence*. (1905. § 922.)]

other's bad general character is apt to be formed loosely from uncertain data and to rest in large part on personal prejudice and on mere differences of opinion on points of belief or conduct, — a chance of error which is relatively small in the specific inquiry as to the other's notorious untruthfulness.

The following passages represent the various aspects of the argument :

BOYLE, C. J., in *Noel v. Dickey*. (1814. 3 Bibb 269) : "It is an observation not less true than trite, that no one is entirely virtuous or entirely vicious. Such, indeed, is in general the preponderance of the virtue or vice of individuals as to entitle them to the general character of good or of bad ; but we cannot, merely from knowing what the general character is, say with certainty what vice or virtue enters into its composition. If, therefore, we would form a correct judgment of a man with regard to any particular vice or virtue, it is necessary we should be informed of his character in that particular respect. . . . A person, therefore, whose general character is bad, may notwithstanding possess such a degree of veracity as to entitle him to credit upon oath ; and whether he does so or not can only be ascertained by inquiry into his character for truth."

GREENE, J., in *Carter v. Cavanaugh*. (1848. 1 Greene Ia. 173) : "The method of questioning as to general character alone appears to us not only vague, but subject to great abuse and injustice. Clannish witnesses, whose intercourse and business are always limited to a particular class of kindred spirits, who may constitute a majority of the neighborhood, often entertain peculiar and contracted views of general character, when applied to those who may not agree with them in social, religious, or political tenets. And thus, by a decided majority of one neighborhood, a man might be represented as possessing an excellent general character ; while in an adjoining neighborhood, where he is equally well known, he might be described as a man of great moral turpitude. . . . The requisites of a good character, and the components of a bad one, are so variously viewed by different and even adjacent communities that they never can become a safe and uniform test of veracity, without confining the inquiry particularly to character for truth. In some communities an ultra-Mason, in others a proscriptive anti-Mason, in this neighborhood an abolitionist, in the adjoining one an anti-abolitionist, would be regarded and styled a bad character ; and thus, in many communities, he who plays cards, or engages in horse racing, or frequents groceries, or works on the Sabbath day, is looked upon and called a bad character ; and yet such men — either the advocates of unpopular sentiments, or those addicted to objectionable habits — may have a most commendable regard for veracity. . . . Thus, by opening this boundless field of inquiry as to 'bad character,' in its multitudinous phases, the most truth-abiding man might often be impeached."

The question also arises whether some other specific vice or group of vices is as significant as bad general character in indicating a degeneration of the truth-telling capacity. The opinion usually reached, is that no specific quality other than that of veracity should be considered :

TRACY, Sen., in *Bakeman v. Rose*. (1837. 18 Wend. 146) : "It has been pressed upon us with earnestness and eloquence that the condition of a public prostitute, being the most debased and demoralized state of human being that can be imagined, necessarily presupposes the absence of all moral principle, and especially that of regard for truth ; and it is therefore contended that a common reputation of public prostitution necessarily includes a common reputation for falsehood. . . . If Courts had the power [to change rules of evidence], it might not be a very discreet exercise of it to attempt to gauge crimes and graduate a standard of vices and immoralities. Loathsome, deplorable, and even detestable as is a condition of public prostitution, it is not the only vice of a great kindred ; theft, forgery, swindling, drunkenness, gambling, adultery, are also well allied ; and if we undertake to determine that the reputation of one vice necessarily includes the reputation of another,

it would be difficult to say when or where we could stop. But . . . [after noting the rule of the Roman and other laws] the common law in this respect certainly is founded on juster notions of human nature; for while it so far recognizes the affinity of vice as not to regard the testimony of a witness of bad moral character as above all exception, it rejects the conclusion that a person guilty of one immoral habit is necessarily disposed to practice all others. And seeing that the absolute exclusion of an immoral witness may operate more to the prejudice than to the advancement of justice, it recognizes that dictate of common sense which no theory can refute, that the natural love of truth, when combined with the fear of temporal punishment, is some restraint, even upon the most depraved, against the commission of a gratuitous falsehood."

197. CHARLES C. MOORE. *A Treatise on Facts, or the Weight and Value of Evidence*. (1908. Vol. II, § 1026.) To enable the trier of facts to comprehend just what sort of a person he is called upon to believe, much latitude of inquiry into the personal history of witnesses is allowed upon cross-examination. The credibility of a witness must be greatly distrusted when he refuses to divulge his business or his whereabouts during several years of his life, or where the history which he gives of his residences, employments, movements, acquaintances, etc., makes it impossible to know anything about him; especially if, the witness's antecedents being seriously questioned on cross-examination, no attempt is made to rehabilitate him on redirect examination.

Particular Defects in Moral Character. On the one hand, we have a judicial statement that "vicious habits, of whatever kind, sear the conscience and prepare those who practice them for the easy utterance of falsehood"; and that, for example, "a continued habit of intemperance has this effect." On the other hand, we have the following: "All experience shows that the general characters of many men are bad, in the common acceptation of the word, while their veracity is unimpeachable. Indeed, most men term that man's general character bad who has some one cardinal vice, although in other respects he may be irreproachable." Chief Justice Nelson of New York said it requires but a casual observation of human nature in its various phases to be sensible of the truth that particular vices and weaknesses may cast a cloud over the moral character of a man whose veracity could be vindicated by the concurrent testimony of all his neighbors and acquaintances. A witness not "fit to be tolerated in any decent community," or with "such a hardened callousness of moral perception as almost justifies the belief of aberration of mind"; a man having no local habitation and often found in the city jail, or one who "seems not to have been a steady worker at anything, other than frequenting saloons and passing his time in such pursuits as are usually followed there," would probably be regarded as tainted in credibility. . . .

Unchastity and Veracity. In estimating the relative value of the oath of a man somewhat addicted to unchastity, and on the other side that of a woman likewise frail, although not a prostitute, Judge Deady remarked that "as the world goes and is, the sin of incontinence in a man is compatible with the virtue of veracity, while in the case of a woman, common opinion is otherwise," and he declared it to be a "fact founded on common experience that incontinence in a man does not usually imply the moral degradation and insensibility that it does in a woman." But, in a case in

Michigan, the court thought that the testimony of a woman against a lawyer with whom she had had illicit relations was "no more open to criticism on this account than the man's, who was in the same moral complications, and equally interested in the result."

Prostitutes. The experience of courts warns them to scan with caution and view with suspicion the testimony of an abandoned woman. We must bear in mind that persons of her low life and character are moved by causes that would not affect people of good morals and tender sensibilities. The conduct of people of this class is often incomprehensible when tested by the standard applied to the generality of mankind. Causes that we would regard as trifling and insufficient are by the low and brutal regarded as most weighty; and their notions of just retribution are often, to the ordinary judgment, the most fantastic, distorted, and extreme. It is improbable that she will tell the exact truth where there is the slightest motive for testifying falsely. Dr. Lushington said that prostitutes "would probably be as willing to bring their evidence to market as they were ready to offer their persons to sale." Judges themselves uniformly refuse to act upon their uncorroborated testimony.

198. WM. C. ROBINSON. *Forensic Oratory; a Manual for Advocates*. (1893. p. 211.) *Bad Character.* The credibility of a witness is scarcely less affected by the opinion which the jury may entertain concerning his personal character, than by their knowledge of the accuracy of his intellectual operations or his truthfulness. In every community there are many individuals whose statements upon any subject are accepted and believed, without an inquiry as to their powers of expression, memory, or perception, simply on the faith engendered by their known integrity and wisdom; and few are the communities in which there are not some whom nobody believes, except when they confess themselves most miserable sinners. This natural tendency to regard the word of the industrious, law-abiding citizen as true, and to doubt the veracity of the idle, dissolute, and shiftless, affects the jury in the court room equally with persons in ordinary life; and hence to expose the adverse witness to them as a man of evil inclinations, immoral habits, and disreputable associations is to arouse against him suspicions of unreliability which diminish, and sometimes remove, whatever good impressions his testimony may have made. The law of evidence indeed places limitations to this species of investigation, in order to prevent the raising of side issues, and to protect a witness of present upright character from an unnecessary publication of his ancient faults. . . .

The real point of inquiry, however, is the reliability of the witness as he now stands in court giving his testimony, not whether he could have been relied on years ago if he had then been offered as a witness; for it is as certain that the liar may become a truthful man as that the truthful man may become a liar, although the latter process is more easy than the former, and what the witness was is thus of slight significance upon the question as to what he is. If the cross-examiner confines himself to this point, he will find material sufficient for all legitimate uses in the present employments, pleasures, and companionships of the witness; and these can be exhibited to the jury, if not by direct inquiries, by general interrogatories into whose answers these facts will be interwoven by the witness.

199. RICHARD HARRIS. *Hints on Advocacy*. (Amer. ed. 1892. p. 112.) It is by no means unnecessary to say that if a convict comes into the witness box, it is idle to attack his credit through his character. Every young advocate thinks there is such an opening here, and the temptation is doubtless great. But you do not need to attack when the fortress has surrendered. The man stands before you confessedly as bad as bad can be; and to carry him through all the scenes of his profligacy and crimes would be but gratuitous cruelty, and would have no effect with the jury except in creating some amount of sympathy on his behalf. They know well enough how to discount the evidence of so abandoned a man; but they know, too (and that is the point for you to remember), that the most detestable villain is yet capable of telling the truth. I have known a convict defeat a cross-examining counsel to such an extent, that he aroused sympathy for himself, and prejudice against the learned gentleman.

It is the weakest remnant of a very old style of advocacy to ask the jury, "Would you believe such a villain on his oath?" The answer is, of course they would, as against another villain, not upon his oath, and against whom he is circumstantially testifying, *unless* you can break down his *evidence*; you will not do that by hammering away at his character.

The jury may not like the man any more than you do, but they may like your client less; and between two villains, the one in the witness box, and the other in the dock, as a rule they will lean towards the former — he at all events is *for the Crown* — at present. . . .

There cannot be a greater mistake than to suppose that a man who is suffering punishment for a crime, and who comes into the box to give evidence, will not be believed because of his character. You will generally find that he is regarded with sympathy to begin with. The jury will weigh his evidence scrupulously; and their attention will be naturally drawn towards the *probabilities* of his story. If you cannot touch these, you will make little effect by constantly referring to his misdeeds.

It is when his motives lead him to the *falsification of facts*, and the falsification is apparent or *highly probable*, that you can dispose of his testimony. Then will you be able to take character, motive, false or exaggerated statements, contradictions, and probabilities, and throw them into the scale against the apparently truthful portions of his testimony. Or if you even go so far as to show *improbabilities in his story*, he will need much corroboration to make it acceptable to the jury. They will treat him as they would a knave in the market whom they should detect with one or two bad coins among a handful of apparently good ones. They would have no dealings with him, not because there were no good pieces, but because suspicion attached to all.

I repeat, It is testimony, and not character, you must deal with in this witness.

200. DAY *v.* DAY. (G. L. Craik. *English Causes Célèbres*. 1844. p. 198.)

Ejectment for title to estates; from one Ann Stokes, through an Huntingdon, 1797. Thomas Day, agent. Ann Stokes testified to the sale of her bastard infant to this real son and heir of his father, but agent. She was cross-examined as a foundling bought by the mother to her character as follows:

Mr. *Garrow*. . . . Q. Do you know a person of the name of Whitehouse? A. Yes.

Q. What was the nature of your acquaintance with him? A. I had no acquaintance with him at all; when his wife died I washed for him.

Q. That might or not lead to a considerable degree of intimacy? . . . Did the circumstance of your washing for the widower lead to any particular intimacy? A. It might.

Q. I don't ask how much you did for pay or gratis. Did it lead to any particular intimacy? A. I will not swear anything at all about it.

Q. You have sworn it once, and my learned friend has taken it down, that you had no particular intimacy with Whitehouse. Upon your oath do you mean to swear that again? A. What I did for him he always paid me for.

Q. Upon your oath, do you mean to swear that again? . . . A. What I did for him he always paid me for.

Q. Upon your oath, had you any particular intimacy with Whitehouse? A. I told you what I did he paid me for.

Q. Then you were not more intimate with him than with all other men in Birmingham; do you mean to swear that? A. No, Sir, I don't mean to swear that.

Q. Were you then particularly intimate? A. We are not intimate. . . .

Q. Having took a little breathing time, we will come back again to our old acquaintance, Mr. Whitehouse. Will you be so good as to inform us, what the nature of your connection with him was? A. What I did for him he paid me for; that was all that passed.

Q. That you swear positively? A. Yes.

Q. Was that all that passed? A. Yes; that was sufficient.

Q. Do you mean to swear that

you had no other connection with him than that of a washerwoman? A. No, Sir; I won't swear that; I did not come to swear that.

Mr. *Erskine*. — I certainly think this is not proper.

Mr. *Garrow*. — I cannot go more regular; it is the constant practice of my learned friend; it is the constant answer given and received; as it goes to a verdict. If she had been living in one instance in a state of adultery, and the other in a state of fornication, I admit the witness would say, she is not bound to accuse herself. But we are upon the credit due to this woman, upon a most important story, and I would borrow what my learned friend very often states to juries — if you find a witness falsified in part, how can you tell where the falsehood ends and truth begins? She has now made it necessary, for the purpose of trying her credit, that I ask those questions, because she has said, over and over again, that there has been no other intercourse between her and that man of whom I have been speaking, than that of washing for him. In the name of God I would ask, what would become of the security of public justice, if, when I come prepared to prove the contrary, perhaps, upon her own oath — I would ask, what would become of the security of public justice, if she may be now secured, or if she be permitted to secure her credit and conscience, by avoiding giving such evidence, and denies it in the manner she has? No man alive, who has experience — no man alive, with the intellects of a baboon (to make use of an expression of my learned friend), would doubt but she cuts up her credit root and branch; she may give it any way she pleases, and it is matter of indifference to me; but the ends of justice must be satisfied.

Court. — This is to answer a criminal charge, which I don't think is proper evidence.

201. **THOMAS HARDY'S CASE.** (1794. *HOWELL'S State Trials*. XXIV, 710).

[Indictment for Treason by a conspiracy to subvert the government by force: the witness here examined was supposed by the defense to be a paid informer who joined the society to obtain proof of its criminal conduct.]

Edward Gosling sworn. Examined by Mr. *Garrow*.

Have you been for any time a member of the London Corresponding Society? — I became a member on the 15th of April.

What April do you speak of? — April, 1794.

Did you become a member in consequence of any communication between you and any magistrate of the country? — I had not been directed to become a member, in consequence of the recommendation of any magistrate; I had been unexpectedly proposed by Whittam, and a magistrate had told me, if another person had proposed me, I should become a member. . . .

Who was the person that first introduced you to the society? — John Hillier.

Did you make application to him first, or he to you? — I first went to Hillier, to make some inquiries respecting a person who was a member of that society.

What led you to go to Hillier to make that inquiry? — From seeing publications of that nature, and I was informed that the person respecting whom I was directed to make the inquiry was a member of the Corresponding Society.

Publications of what nature? — From seeing publications in Hillier's shop window, which appeared to me to be of a seditious nature.

What business did Hillier carry on? — He sold pamphlets.

From that you thought it likely he was a member of the society, likely to give you information, there being some man you wanted to inquire about? — Yes.

When did you first make your application to Hillier? — I believe towards the end of March, or the beginning of April.

For what purpose did you become a member of the Corresponding Society? — On the 14th of April when I first became a member, I was unexpectedly proposed; on the day following I informed Mr. Wickham that I had done so.

What passed between you and the magistrate is not evidence, but in consequence of what passed between you and him, why did you attend the meeting? — To discover whether they had any serious intentions of arming.

You have stated that you communicated something upon the subject, to Mr. Wickham? — Yes.

Was it with his approbation that you attended the meeting for the purpose you have now stated? — It was.

Did you from time to time communicate to Mr. Wickham such facts as came to your knowledge? — I did.

And went there for the express purpose of procuring information, and giving it? — I did. . . .

Edward Gosling, cross-examined by Mr. *Erskine*.

What is your Christian name? — Edward.

Edward Gosling? — Yes.

Are your father and mother living? — Yes.

What are you by employment or trade? — At present I am employed by Mr. Wickham. . . . I was employed before this business by Mr. Colquhoun, in writing.

What sort of writing? — Both in his private business and on his public business.

Mr. Colquhoun is an attorney, is he? — No, a magistrate in Worship-street.

When did you begin writing for him? — About September last, but that was only occasionally.

What way of life had you been in before that? — Before that I kept a broker's shop.

Were you a dealer in naval stores; I am not asking any question you can object to, were you a dealer in naval stores? — I never in my life, upon my oath, to my knowledge, bought a store that ever was the property of his majesty, if that is what you mean.

I should have no right to ask that question. — I know the reason for which it was put; and it is a question which, if I was not conscious of my innocence, I had no right to answer, but as I knew I could safely do it, I thought it proper to answer.

Then, perhaps, you have never said to anybody the direct contrary of what you are saying now to me? — I did say the direct contrary; I was asked by Mr. Worship, when I went to buy a print, what I was? and what my address was? As I conceived he would not let me have the print if I told him I was with a magistrate, I told him I dealt in naval stores.

Did you ever say to anybody that you dealt in naval stores, and that you should think no more of cheating the king than of guillotining him? — Never to my knowledge; I will swear positively, I never mentioned the word guillotining the king.

Did you never say to anybody, upon your oath, that you lived by smuggling, and cheating the king in his stores? — Never upon my oath.

Have you always gone by the name of Gosling? — I have not . . . and am willing to explain why I went by another name; as I find every advantage is wished to be taken of me, I trust the mercy of the Court will not suffer any improper question to be put to me.

Lord Chief Justice EYRE.— As to any question which tends to accuse you of any crime, not immediately connected with this matter, I will protect you; but at the same time

keep your temper, attend to the question, and give a direct answer.

Mr. *Erskine*. — I have treated you with civility, I am sure. Did you ever go by the name of Douglas? — I did.

When did you first assume the name of Douglas? — I believe as much as ten years since.

How long did you continue the name of Douglas? — I would wish to relate the circumstances under which I took that name.

Lord Chief Justice EYRE. — You had better answer the question. — I carried on the business of a hair-dresser in that name, for I believe pretty near seven years. . . .

Had you any particular reason for changing your name? — I will state my reason; my father had a shop of business in the city; his business was chiefly in the wig and shaving way; for improvement I wished to go to the west end of the town. I went and worked with a man, whose name was Penton, in Bloomsbury, for improvement; it was, perhaps, from false pride I did not choose it to be known that I was working as a journeyman, when my father kept four or five men; and as for taking the name of Douglas, I took it from a play bill.

I have no objection to a decent pride; you took a very good name. It struck you in a moment to take the name of Douglas from a play-bill? — That was the reason that struck me at that time, and I had no thought of continuing under that name.

Pray how long did you play this part of Douglas? — I continued near seven years in that name. . . .

Let me ask an explanation of something, which I confess I did not understand; how came you to say to Mr. Worship that you dealt in naval stores? — Because I thought that would preclude all inquiry; because I did not choose to give him my address; because I thought if he found I was with Mr. Wickham,

he would refuse then to let me have what I wanted.

Mr. *Attorney-General*. — Do you mean Worship, the engraver? — Yes; I saw he suspected I was not friendly to their cause.

Mr. *Erskine*. — Who is Mr. Worship? — A secretary of a division of the Corresponding Society.

Did you never make use of the expressions that I asked you to before, that you cared no more for cheating the king than the expression I stated before? — Never in my life. . . .

Do you know a Mrs. Coleman? — I do not.

Look across to the jury. — I do not know a Mrs. Coleman, now.

Did you ever know a Mrs. Coleman? — I did.

Had you any dealings of any sort with her? — Certainly, she rented a shop of me.

Had you no dealings of any other sort? I am not putting a question of any immoral nature? — Certainly, I had business; she rented a shop of me.

Is that all? — She died at my house, and I buried her.

Did she leave any will? — Yes.

Whom did she leave her property to? — Her property was partly left to one Burroughs, and partly to one James Leech.

Who made the will? — I wrote it.

Do you know Mrs. Biffin? — I do not.

You were very ill used about that business, in which you had done nothing but that which was right? —

Gosling. — How ill used?

I mean you got into some dispute and trouble about it? — None at all, I was in no trouble about it.

There was no complaint made against you of any sort? — There was no just cause of complaint.

I do not ask whether there was any just cause of complaint, but was there any complaint made against you by anybody upon the subject? —

Gosling. — I cannot say I recollect the particular circumstances

that might pass; there was a brother by a former husband who came up out of the country.

Do not understand me to be doing so improper a thing as to be imputing any crime to you, and to ask you to reveal it; far from it. I only ask whether anybody was wicked enough to make any complaint of your conduct in that case? — I do not know that there was any complaint.

Will you swear there was none — upon your oath, was there no complaint made against you upon the subject of this will? — I cannot tell what complaint may have been made.

Upon your oath, was there not a complaint made against you, to your knowledge, for fabricating this will? — Never, that I know of.

Will you swear that? — I will swear I never heard any such thing.

. . . .
Who was that James Leech to whom this woman left this money? — A son of my wife's.

Who was Burroughs, who was that other person? — A cousin of hers, or some such thing.

What connection had you with the woman? — I had no connection, any farther than rendering her every service in my power, during a long illness, in which I was at considerable expense.

How long had she lodged at your house? — I cannot tell exactly.

A year? — I cannot tell.

Will you swear that she lived six months with you? — I do not know the time.

Was it two months? — It was longer than that.

Three months? — Longer than that.

Four months? — I cannot state to a month.

Was the will made by an attorney? — It was not.

By yourself? — Yes.

Am I to take you that you mean to swear now, that no complaint was made against you as having

forged that will? — I swear, that to the best of my knowledge or recollection, I never heard such a thing.

Will you swear positively, you never have been charged with it; a man that is charged with a capital felony cannot forget it? — I do not recollect that ever I was.

Good God! Do you mean to swear that you do not remember whether you were charged with a capital felony or not? — I do not know that I ever was.

Will you swear positively that no such charge was brought against you? — I can swear no farther than that to the best of my knowledge, it never was.

Lord Chief Justice EYRE. — A charge brought when and where? — it may be a fact within his knowledge, or it may not.

Mr. *Erskine*. — I am asking you whether there was not a complaint made, that you were charged in your own presence, with having done it? — Never, to my knowledge.

Am I to understand that there was not a complaint made in your presence against you, for having forged that will? — I do not recollect that any person ever did.

Will not you go to the length of swearing that nobody ever did so? — I can only speak to the best of my recollection and knowledge.

Mr. *Garrow*. — I submit to your lordship that is the only answer a witness can make to such a question.

Lord Chief Justice EYRE. — There is no occasion for your interrupting the examination; probably it is an answer; but he may be pressed to see whether he can answer farther or not.

Mr. *Erskine*. — Whether anybody ever charged you with it in your presence? — I never recollect that any person ever did.

Do you know a Mr. Cox? — Yes; I know Mr. Cox, a cheesemonger.

How long have you known him? — I cannot exactly state how long I have dealt with him.

Dealt with him in what? — In cheesemongery and butter, and things of that kind, and some hams.

For the use of your family? — Yes; and to sell.

I thought you were a hair-dresser; what! do you deal in hams? — My wife kept a shop of that sort, and I dressed hair.

Have you never had any other sort of dealings with Mr. Cox, than that which any man has with a fair tradesman that bought hams of him in the ordinary course of business? — No.

And you swear that, positively? — I do not remember anything else; if you name any particular charge, if it comes within my knowledge, I will own it.

Mr. *Erskine*. — I do not stand here to make charges.

Gosling. — I purchased hams of him, and in some there were great holes filled up with mortar and stones.

Then the hams were of a bad quality, filled up with mortar and stones? — Some of them were.

Then Mr. Cox, the cheesemonger, seems to have cheated you? — Certainly; he did not use me well when I was ignorant in the business. . . .

Am I to understand you to say, that you never dealt at all in stores; I do not mean to say dishonestly or improperly?

Gosling. — What kind of stores?

Mr. *Erskine*. — Naval stores — ship stores? — I have purchased old cordage, bad sacking, and such kind of things; but those I do not consider to come under the denomination of naval stores.

What were the articles that you purchased? — What is commonly called hand stuffing, used for the making of paper.

Did you never say, (I do not ask you whether you did it, because I have no right to do that,) but you never said that you were a dealer in raw materials; that the person you spoke to, asked you to explain it; and whether in answer to that you said

that you attended the sale of his majesty's stores at the dockyards, at Sheerness, and so on; that you were well acquainted with the storekeepers, and that you generally bought them at a fifth of their value, by feeing the storekeepers to condemn them? — I never said that; I will relate to you one circumstance upon which that is taken: I wished to get information respecting them, and Mr. Colquhoun would give me credit for that; it was upon that very business I was taken into his employment to give intelligence respecting that; I understood from Hillier that he had a relation who was a quartermaster there, and I wished, through his means, to obtain information for the service of government.

Why, you had a great deal upon your hands — you say you told him the same as Mr. Worship; you did not tell Mr. Worship that? — I told him I was a dealer in naval stores.

But did you tell Mr. Worship that the way you dealt was by feeing the storekeepers to condemn them? — No, I did not tell him that.

When you were reproved for that, did you not justify your conduct, and say that you had followed the practice for years, and thought it no crime to cheat the king? — Never.

Was it in the service of Mr. Colquhoun, that you bought that paper stuff and things? — I never bought any paper stuff belonging to his majesty in my life, upon my oath.

But I ask you, were you both a dealer in stores yourself honestly; and were you employed as an informer to prevent other people being dishonest? — I never had, to my knowledge, any charge brought against me for dishonesty for it; I obtained every information I could to prevent children and other persons, that might be tempted to purloin things; the information was not given against any person, but merely hints to prevent pilfering;

no person was accused upon that information nor did I receive any reward for it.

I do not comprehend you; explain to me, what was the reason why you told Hillier you had been in the constant course of cheating government in that fashion? — I did not tell Hillier I had been in a constant course of cheating the king; he mentioned to me his having a relation a quartermaster at the yards, and to whom he talked of sending some of the resolutions; I thought that from him, as it is the quartermaster that puts up the stores, that I might obtain some information relative to those stores.

Is that an answer to my question? I asked you why you told Mr. Hillier you were in the course of doing that which you have been now stating. — I did not tell him I had been in the course of cheating the king at all.

Nor anything to that effect? — I only told him that I was a dealer in naval stores, nothing farther.

Did you ever tell him that there were great quantities of copper conveyed out of the docks, and the manner in which it is conveyed out? — Never, the manner in which it is conveyed out.

Whether you did not tell him the copper was conveyed out of the dockyards in butter firkins? — No; I have given information to Mr. Colquhoun that copper has been sent away, but that was not from the king's stores; but supposed to be copper fraudulently conveyed away.

I am asking you, whether you did not tell him you had been employed yourself in conveying away this copper? — I never told him that I was employed; I wished to gain what information I could from him, and that was the sole purpose.

Did you ever tell him that you were acquainted with a woman who lived somewhere about Tooley-street, and that there were twelve hundred weight found upon her premises? — I told him I had heard

such a seizure had been made, but I never saw the woman in my life; I had heard of it, and merely related that I had heard that such a thing was the fact. . . .

Edward Gosling reëxamined by *Mr. Garrow*.

. . . . You have been asked a vast number of questions, respecting Mrs. Coleman's will; was there any suit instituted to dispute the legality of that will? — None.

Was there any prosecution for that which is called the forgery of it? — None.

Was there ever, to your knowledge, any complaint made against you, that there was anything foul in the transaction? — Not that I know of; the brother came to town, and appeared perfectly satisfied. Was it, upon your oath, a fair, honest transaction, as far as you had anything to do with it; aye or no? — It was. . . .

Lord Chief Justice EYRE (in summing up the evidence for the jury):

On his cross-examination, Gosling is asked what situation he was in; he said he kept a broker's shop; he is asked if he did not deal in king's stores; he said he did say to a man to whom he was unwilling to give his name, that he dealt in naval stores, thinking that would put the man off from any further inquiry — he says that he is employed by a magistrate, in Worship-street, which occasioned him to say that. He denies that he lived by smuggling, and cheating the king in his stores. He was asked if he ever went by the name of Douglas; he says he did for six years, while he carried on the business of a hairdresser, which is ten years since, in Petty France, at No. 3. He says his father had a shop of business in the city, that he wished to go out for improvement, and did not like to appear as

a journeyman, when his father kept four or five men in his own house; that his taking the name of Douglas was a mere accidental circumstance.

. . . . He is then asked as to a Mrs. Coleman, who had lived with him, and died in his house; he says he made her will, and that no part of her property was left to her relations — he is asked if a brother of a former husband had not made some charge against him — he says he never heard any complaint, or any charge against his conduct respecting the will, but that a brother had come up to make a claim. He is asked if he knows one Cox, cheesemonger — he says he has dealt with him, and he did not use him very well, but nothing turns upon that, for he is not called. . . .

Gentlemen, I stated to you before, that this witness has given very important evidence, tending to show the determined purpose of this Convention to use force against the king, his family, and the government. If this man's evidence can be depended upon, he certainly states Baxter to use very strong language, so indiscreet, that one could hardly have thought that a man would have ventured to use — and on the other hand, the observation made upon this is certainly founded, that this man is not contradicted with regard to the testimony that he gives, and that all they rely upon to shake his credit is what turns out upon his cross-examination — the account he gives of himself, of his having told a man that he dealt in naval stores, for a vile purpose — having borne the name of Douglas — having acted about in that sort of way, and going there for the purpose of giving information to government. Gentlemen, it is your province to judge what degree of credit you think fit to give to this man's evidence.

202. G. L. DUPRAT. *Le Mensonge: étude de psychosociologie*. (1909. 2d ed. pp. 34, 132, 181, 187.) *Psychophysiology of Mendacious Invention*. Mendacious invention rests on a well-known physiological process. We do not mean to invoke here the supposed laws of mental association, as established by English psychologists from Locke and Hume to Stuart Mill, Bain, and Spencer. To say that syntheses of representations are formed by contiguity, resemblance, or contrast, is merely to describe certain facts, not to explain them. Every imaginative synthesis must be preceded by a dissociation of the elements which already formed other empiric syntheses; for the imagination does not create its materials, it only gives them a new form and new relations, not usually pushing the analysis very far. This dissociation is scarcely ever intentional. It is due to the mutual interference of different syntheses having common elements, but in such a way that the common elements are associated here with some and there with other assumptions. Thus the associations are less firm. A synthesis is indeed difficult to dissolve in proportion as its components have less "affinity" with other elements than with each other; and this "affinity" of the representations or their parts with each other depends on the person's habit of associating them or not.

Hence a prime condition for mendacious invention is an experience such as has already produced interferences of association which favor dissociation. This is why a denial, pure and simple, in which lying invention is at its minimum, is much more at the command of children and less experienced or less gifted adults than a deceptive affirmation; for the latter is the product of a somewhat fertile imagination.

This process of mental dissociation is based on a breakdown of nerve habits (what Ribot has termed the "dynamic associations" of nerve cells). Yet, once these habits are broken down, how are we to explain the establishment of new relations between the different nerve elements (neurones, or fibers) and between the separate cortical regions? Doubtless the oldest habits can be promptly restored, and sometimes this suffices to give rise to mental syntheses different from those which would represent a true assertion. But it still remains to explain what that stimulus is (varying from real experience) which can produce either the return of the original nerve habit or the process which ends in making a new habit.

It is useless to invoke (as Bain does) the "affinities"; we have just noted that the elements of our representations have no other "affinities" than those proceeding from our habits. Nor can we have recourse to those "nervous explosions" along the line of least resistance, of which William James speaks; these explosions might in all probability not produce the mental formation required by the interests to be served by a lie. Is an adequate reason to be found in Paulhan's law of systematic association and systematic inhibition? This, indeed, shows plainly enough that the psychic elements associate when they can form a *systematic* whole, when they can coexist in one and the same synthesis, from which are expelled the elements incompatible with those admitted; these incompatible elements thus being inhibited, *i.e.* deprived for a greater or less period of the maximum of conscious clearness. But this law does not sufficiently explain the whole case; for a system presupposes some principle or general end; . . . in a given object we perceive only that which interests us, *i.e.* responds to

a dominant tendency; and so too what we conceive is what interests us; in short, *our mental syntheses, including our mendacious inventions, are determined by our settled desires or repulsions.*

Thus the following principle may be offered as emerging from the foregoing analysis: *Every mendacious invention is determined by a tendency.* This principle Ribot has demonstrated for the creative imagination; and since, as above shown, the liar's imagination may include all modes of creative imagination, what is true of the one is true of the other. "All forms of the creative imagination," says Ribot, "imply affective (emotional) elements."¹ This fundamental physiological relation between the cerebral regions serving the emotional life (desire), and those serving ideation and imagination, is what must serve as the basis for explaining the process of mendacious invention. *This physiological relation matches the psychological one between the trait-tendencies of a person and his production of images enabling him to tell a lie.* A person of a specific trait or temperament will be led into certain kinds of lies in proportion as that trait or temperament is more favorable to excitation or depression. A mendacious denial is easy to people of calm, apathetic, or melancholy disposition, given to slow movements. A mendacious affirmation is easy to persons inclined to rapid movements, — to an activity, if not disorderly, at least multifold and varied. Literature has often drawn the contrast between these two opposed temperaments, — the calm, cold one, and the lively, daring one; and almost always the latter has been taken as the type of the liar, *e.g.* Daudet's "Numa Roumestan," the temperament of the South. But alongside of this temperament we must also point out its opposite, the smooth-tongued, soft-speaking personality, a radical enemy of truth, the type of hypocrites of all degrees.

Thus the diversity of human traits and tendencies produces a diversity of liars. And the lie is the more important, as psychological phenomenon, in proportion as it reveals the basis of the Ego beneath it. For then the derogation from the truth is not a mere casual incident in the life of an unstable imagination, but is a direct consequence of the person's rooted disposition to evil.

Kinds of Mendacious Character. [The mendacious tendency is found alike in persons psychologically normal and abnormal. Among abnormal classes may be noted the habitual criminal, the hysterical, the degenerate. The normal personality will here be considered.]

All men (says Ingegnieros) are simulators in a greater or less degree; but the tendency to simulate is the dominant note of the trait in those who form the type of simulator, — the most comprehensive type of those who fit the common term "liar." And no type is more frequently met with in persons of all ranks and occupations.

Ingegnieros has classified simulators as follows:² (1) the crafty, (2) the servile, (3) the practical jokers, (4) the "dissidents," (5) the neuropathic, (6) the suggested. (1) The *crafty* simulator is always ready to simulate; he has educated his emotional reactions so that they never betray them-

¹ A desire or a repulsion is, as we know, an incipient movement, or else a vivid image of a movement, united to a more or less clear representation of an end to which the movement tends.

² "Simulaciòn de la locura"; "Simulaciòn en la lucha por la vida."

selves in his countenance. He is a dissimulator to the roots of his being. But he employs the most varied means for succeeding. Women show themselves particularly apt in a thousand methods of sly dissimulation. (2) The *servile* simulator is a variety of the crafty one, with the peculiarity that his tendency is to subordinate his attitude, facial expression, and words to the requirements or desires or unspoken wishes of those who are his masters and whose good will or indulgence he hopes for. He may be either ambitious or shrewd, or lazy, apathetic, timid, or weak. (3) The *practical joker* turns simulation into an amusement. He enjoys mystifying his fellows without personal profit to himself. . . . This class may also be made to include the simulator who feigns the possession of exceptional talents or virtues and takes pleasure in duping the public at large or a select circle with his deceptive assertions and inventions. . . . (4) The "*dissidents*" are those who feign sentiments which they do not possess, in order to produce a reaction against current tendencies which they deplore and wish to improve. . . . (5) The *neuropathic* simulator is well known. These border on the hysterical, the alcoholic, and the degenerate. . . . (6) The simulator by *suggestion* is rather a victim than a culprit. But here must be included those persons who receive suggestion from the environment, *i.e.* are subjected to a vague influence which gives vent to their morbid tendency to deceptions and more or less skillful lies.

Ingenieros' classification may seem not systematic enough. It rests on the distinction between normal and pathologic persons, and utilitarian and disinterested ends. It would seem that there may well be as many secondary types of simulators as there are distinct human traits, *viz.*: (1) amorphous, and polymorphous or unstable; (2) unbalanced, and balanced; (3) impulsive, and obsessed; (4) emotional, and apathetic; (5) intuitive, or imaginative, and ratiocinative; (6) strong-willed and weak-willed. Thus they fall into groups (of contrasted traits), each presenting different aspects of simulation.

(1) The *amorphous* are susceptible of simulation under the influence of all sorts of suggestions. They have no more a fixed trait in their simulation than in the rest of their mental and social activity. They may exhibit trickery in any fashion required by their interests or desires or caprices, as circumstances vary. They are usually weak of will, and may thus yield to the exigencies of their environment, becoming, if need be, servile in their lies. — The *polymorphous* are often degenerates or hystericals, — liars and simulators to the degree that they change easily in personality. They do not long persist in any one species of simulation; *e.g.* they may in succession simulate piety and atheism, simple-mindedness and skepticism, cautiousness and imprudence, timidity and courage, — lying according to the rôle they are playing, often without interest to serve, and sometimes unconsciously. (2) The *unbalanced* are simulators only intermittently; they have accesses of candor which make them abandon for a period their system of feints and lies. They mislead by the uncertainty which they thus produce in the mind of the observer. (3) Next to them may be classed the *impulsives*. These yield, but only intermittently, to their need for lying and for simulating the sentiments calculated to induce confidence in their veracity. This need is most often explainable by sudden cravings or repulsions, unforeseeable even by the subjects themselves. Such a person,

without knowing why, will suddenly experience an irresistible desire to deceive in some way his wife or his friend, and will therefore simulate anger or grief or astonishment. — The *obsessed* are dominated by a fixed idea, an exclusive aim, an emotion, and sometimes are driven to simulation by the exigencies of a purposeful mind; success in their enterprises (sometimes such as do not merit approval) depends often on their aptness in feigning, in the expression of ideas which they know to be false. The pretenders who obtain a public following are of this type at bottom. (4) The *emotionals* have little aptness for simulation; they are not able to control themselves well enough. The *apathetics* will not take the trouble to do so. Nevertheless, some emotionals do become simulators, usually through fear, love, hatred, pride, or vanity; *e.g.* they will feign altruistic sentiments, for fear of seeing their egoism unmasked; or affect a deep sensitiveness in matters of æsthetics, religion, or morality; or carry on a mendacious discourse (often lacking coherence) while under the emotion's influence. The *apathetics* (or indifferent), being little inclined to altruism, simulate mostly a sympathy or a pity or even a burst of feeling, when circumstances and the environment constrain them; their discourse is then particularly deceptive. (5) The *ratiocinatives* are those who use dialectics (sometimes keen), captious argument, long series of propositions, so as to simulate depth of thought. How many such disputers — metaphysicians, theologians, and others — have abused the confidence of their hearers or readers by a sterile logomachy, of which they themselves have not always been the dupes! Must we not admit that there are many men, clever, educated, masters of thought and language, who are so devoted to empty disputatiousness that they overstep (in one or another way) the boundary between honesty and simulation? Starting with little real earnestness, they do not hesitate to make assertions of whose slender objective soundness they are well aware; but their logic draws them on; they must be consistent with themselves and their earlier professions of good faith; they are driven to simulate beliefs which they no longer entertain, and to defend dogmas and principles which they have ceased sincerely to approve. The fear of being a renegade or a heretic makes them persevere in their attitude, and lies and simulation form a larger and larger part of it. — The *intuitives*, while less the slaves of a purposeful mind, are often lacking in that check which logic puts upon excessive license in one's interpretations of experience; they are too ready to think that they can depart, without harmful consequences, from a strict veracity. — In contrast with persons of scientific mind, who are scrupulous in the observation of facts and the verification of hypotheses, are the *imaginatives*. Contradiction does not in the least alarm them; whether through diletantism or through self-interest, they put forth at every turn their romances (sometimes very ingenious). These are the typical simulators, especially when their imagination is at the service of a will strong enough to persevere in important schemes. In this class belong notably those who simulate illness to obtain help, reward, or favor, or exoneration from military service, taxes, or other social burden.

All the above described temperaments lend themselves more or less to effectuate some form of simulation. Some persons seem to be innately disposed to this mode of life. Certain children at an early age exhibit as their peculiar trait a mendacity accompanied by simulation; experience

and habit, necessary for its development, increasingly betray it as they become older; and one may meet with adults and old persons whose every attitude, gesture, and discourse is directed to the deception of others. Success has made them persevere in this marked aptitude. One is almost tempted to believe that (in primitive as well as in civilized communities) supremacy is assured, in the struggle for existence, not to those who employ honest methods and conscientious assertions, but to the astute and shrewd simulators who employ their skill, when needed, to the detriment of the simple, — ending in the discomfiture or the elimination of the latter. . . .

Conclusion. The foregoing study has now shown us that the lie is a phenomenon common to all civilizations, all classes of society, all ages, and both sexes. . . . It is at one and the same time a psycho-physiologic and a psycho-sociologic phenomenon. . . . It originates spontaneously, — apart from imitation or faulty education, and merely by the combined operation of imagination and the personal tendencies or aims unsatisfied by the natural course of events. Nevertheless, education, imitation, fashion, manners and morals, all strengthen the mendacious tendency; while weakness, illness, mental and physiological incapacity, lack of the higher sentiments (united sometimes with arrest of intellectual development), degeneracy, all favor the hatching of the lie-tendency; and, finally, social causes, — such as war, persecution, popular emotions, mob frenzy, — repression by violence or coercion, combine to make mendacity almost inevitable.

We have thus shunned (it will be noted) all those shallow explanations of mendacity which merely use a form of words, — such epithets, for example, as “innateness,” “the inventive faculty,” etc., and such supposed laws as that “the lie tends to develop in a social medium in proportion as that medium becomes complex,” and the like. . . .

And in showing that the lie is due to specific tendencies which are themselves closely bound up with individual character, temperament, physiological constitution, and neuro-muscular activity, we have also shown the emptiness of the unconscionable claims of those moralists and pedagogues for whom our warfare against the lie has its basis in a commandment inscribed in golden letters for centuries past on the walls of churches and schools. In sober fact, the warfare is against rooted human desires or antipathies, often concealed from our view, and no less difficult to overcome than they are to discover. And our means of overcoming is *to awaken contrary tendencies*, — not artificial ones, but those tendencies and desires which are normally implanted in human nature and go to make up the noblest traits that mark humankind.

And so the warfare against the lie is simply a part of the great struggle for the moral life as a whole.

SUBTITLE F: FEELING, EMOTION, BIAS

203. G. F. ARNOLD. *Psychology applied to Legal Evidence*. (1906. pp. 236, 260.) . . . The effect of *desire on belief* cannot be omitted from consideration in such cases if we are to come to a correct conclusion. "If a certain objective combination," says Professor Stout, "presents itself as the only condition, or the most favorable condition, of obtaining a certain end, the active tendency towards this end is of itself a tendency to believe in the objective combination." As to the way in which Desire acts, the following is the same writer's account: "This influence of Desire on Belief often operates by simply diverting the attention from counter evidence. . . . The mind is so absolutely preoccupied by certain tendencies, that whatever crosses them either never comes before consciousness at all, or, if it does, is immediately dismissed. . . . It also directly intensifies the resistance offered by a mental combination to conditions which might otherwise dissolve it. . . . But the more often they (*i.e.* such beliefs) are acted upon, the more completely they become incorporated with the original conation so as to become an integral part of it; hence the support they receive from it is increased." With this may be compared the manner in which Feeling in general influences Belief: "This action of feeling on belief is in every case mediate; that is to say, it works by modifying the processes of ideation themselves. It is by giving preternatural vividness and stability to certain members of the ideational train called up at the time, *e.g.* ideas of occurrences which we intensely long for, or especially dread, and by determining the order of ideation to follow, not that of experience, but that which answers to and tends to sustain and prolong the feeling, that its force serves to warp belief, causing it to deviate from the intellectual or reasonable type."

Feeling, then, acts in part by warping the intellectual element in Belief.

Emotion is a great source of illusion, because it disturbs intellectual operations. It gives a preternatural vividness and persistence to the ideas answering to it, *i.e.* the ideas which are its excitants or which are otherwise associated with it; hence when the mind is under the temporary sway of any feelings as, *e.g.* fear, there will be a readiness to interpret objects by help of images congruent with the emotion. A man under the control of fear will be apt to see any kind of fear-inspiring object whenever there is any resemblance to such in the things actually present to his vision. . . . The state of emotion (apart from its promotion of the flow of ideas if it be not too strong) is antagonistic to thinking, which implies at the moment a certain subsidence of the feelings and a considerable suppression of outward action or movement, but to paralyze the intellectual activity it must be very strong. . . . Professor James explains our tendency to believe in emotionally-exciting objects (objects of fear, desire, etc.), as due to the bodily sensations which emotions involve, for the more a conceived object excites us, the more reality it has; and he considers the greatest proof that a man is *sui compos* to be his ability to suspend belief in presence of an emotionally-exciting idea. Now, this power is the result of education, and does not exist in untutored minds, for which every exciting thought carries credence. . . .

If imagination is the most important quality [for correct thinking], prejudice is perhaps the worst impediment. Psychologically speaking, it is a case of mental preadaptation which may be voluntary or involuntary, and is a source of active illusions. . . . For good observation what is chiefly needed is self-restraint, in order to limit the attention to what is actually presented and exclude all irrelevant imaginative activity. The common faults of the bad observer are the impulse to go beyond the facts observed and stray into inference and to look out beforehand for a particular thing and so create a prepossession. The undisciplined mind is apt to see what it expects, wishes, or, may be, fears to see, and to overlook that which it is disinclined to believe. It often happens in consequence that a witness states things which appear to the more educated mind of the magistrate to be manifestly false or absurd and who is therefore inclined to reject the whole. But such an attitude is more frequently than not a wrong one. An effort should be made to arrive at what the witness actually saw, apart from the explanations he gives of them, for it is usually the tacit explanations which are wrong.

204. HANS GROSS. *Criminal Psychology*. (transl. Kallen, 1907, § 83, p. 375); and *Criminal Investigation*. (transl. Adam, 1907, p. 78.) *Intellectual Attitude as affecting Testimony*. It would be foolish to assert that we have the right to demand only facts from witnesses. Setting aside the presence of inferences in most sense perceptions, every exposition contains, without exception, the judgment of its subject matter, though only, perhaps, in a few dry words. It may lie in some choice expression, in the tone, in the gesture, but it is there, open to careful observation. Consider any simple event, *e.g.* two drunkards quarreling in the street. And suppose we instruct any one of many witnesses to tell us only the facts. He will do so, but with the introductory words, "It was a very ordinary event," "altogether a joke," "completely harmless," "quite disgusting," "very funny," "a disgusting piece of the history of morals," "too sad," "unworthy of humanity," "frightfully dangerous," "very interesting," "a real study for hell," "just a picture of the future," etc. Now, is it possible to think that people who have so variously characterized the same event will give an identical description of the mere fact? They have seen the event in accordance with their attitude toward life. One has seen nothing; another this; another that; and, although the thing might have lasted only a very short time, it made such an impression that each has in mind a completely different picture which he now reproduces. . . . Voltaire says, "If you ask the devil what beauty is, he will tell you that beauty is a pair of horns, four hoofs, and a tail." Yet, when we ask a witness what is beautiful, we think that we are asking for a brute fact, and expect as reliable an answer as from a mathematician. We might as well ask for cleanliness from a person who thinks he has set his house in order by having swept the dirt from one corner to another.

To compare the varieties of intellectual attitude among men generally, we must start with sense perception, which, combined with mental perception, makes a not insignificant difference in each individual. Astronomers first discovered the existence of this difference, in that they showed that various observers of contemporaneous events do not observe at the

same time. This fact is called "the personal equation." Whether the difference in rate of sense perception, or the difference of intellectual apprehension, or of both together, are here responsible, is not known, but the proved distinction (even to a second) is so much the more important, since events which succeed each other very rapidly may cause individual observers to have quite different images. And we know as little whether the slower or the quicker observer sees more correctly, as we little know what people perceive more quickly or more slowly. Now, inasmuch as we are unable to test individual differences with special instruments, we must satisfy ourselves with the fact that there are different varieties of conception, and that these may be of especial importance in doubtful cases, such as brawls, sudden attacks, cheating at cards, pocket-picking, etc.

The next degree of difference is in the difference of observation. Schiel says that the observer is not he who sees the thing, but who sees of what parts it is made. The talent for such vision is rare. One man overlooks half because he is inattentive or is looking at the wrong place; another substitutes his own inferences for objects, while another tends to observe the quality of objects, and neglects their quantity; and still another divides what is to be united, and unites what is to be separated. If we keep in mind what profound differences may result in this way, we must recognize the source of the conflicting assertions by witnesses. And we shall have to grant that these differences would become incomparably greater and more important if the witnesses were not required to talk of the event immediately, or later on, thus approximating their different conceptions to some average. Hence we often discover that when the witnesses really have had no chance to discuss the matter and have heard no account of it from a third person, or have not seen the consequences of the deed, their discussions of it showed distinct and essential differences merely through the lack of an opportunity or a standard of correction. And we then suppose that a part of what the witnesses have said is untrue, or assume that they were inattentive or blind.

Personal views are of similar importance. Fiesto exclaims: "It is scandalous to empty a full purse, it is impertinent to misappropriate a million, but it is unnamably great to steal a crown. The shame decreases with the increase of the sin." Exner holds that the ancients conceived *Œdipus* not as we do; they found his misfortune horrible; we find it unpleasant.

These are poetical criminal cases presented to us from different points of view; and we nowadays understand the same action still more differently, and not only in poetry, but in the daily life. Try, for example, to get various individuals to judge the same formation of clouds. You may hear the clouds called flower stalks with spiritual blossoms, impoverished students, stormy sea, camel, monkey, battling giants, swarm of flies, prophet with a flowing beard, dunderhead, etc. We have coming to light, in this accidental interpretation of fact, the speaker's view of life, his intimacies, etc. This emergence is as observable in the interpretation also of the ordinary events of the daily life. There, even if the judgments do not vary very much, they are still different enough to indicate quite distinct points of view. The memory of the curious judgment of one cloud formation has

helped me many a time to explain testimonies that seemed to have no possible connection.

Attitude or feeling. — This indefinable factor exercises a great influence on conception and interpretation. It is much more wonderful than even the march of events, or of fate itself. Everybody knows what attitude (*Stimmung*) is. Everybody has suffered from it, everybody has made some use of it, but nobody can altogether define it. According to Fischer, attitude consists in the compounded feelings of all the inner conditions and changes of the organism, expressed in consciousness. This would make attitude a sort of vital feeling, the resultant of the now favorable, now unfavorable, functioning of our organs. . . .

The attitude we call indifference is of particular import. It appears, especially, when the ego, because of powerful impressions, is concerned with itself; pain, sadness, important work, reflection, disease, etc. In this condition we depreciate or undervalue the significance of everything that occurs about us. Everything is brought into relation to our personal, immediate condition, and is, from the point of view of our egoism, more or less indifferent. It does not matter whether this attitude of indifference occurs at the time of perception or at the time of restatement during the examination. In either case, the fact is robbed of its hardness, its significance, and its importance; what was white or black, is described as gray.

Strong Feeling as a Cause of Inaccuracy of Observation. If men perceive the most insignificant facts in the most diverse manner, even when it is impossible that these facts should produce on the observer any emotion preventing him from observing with absolute calm, how much more will their impressions be diversified under circumstances calculated to produce in the onlookers excitement, fear, or terror. The fact is that in such a state they are absolutely incapable of observing accurately. . . .

Recently the author had the opportunity of verifying this by an analogous circumstance. He was present at an execution at which for some reason or other the executioner wore gloves. After the execution he asked four officials who were present what was the color of the executioner's gloves. Three replied, respectively, black, gray, white; while the fourth stoutly maintained that the executioner wore no gloves at all. Yet all four were in close proximity to the scaffold; each replied without hesitation, and all four are still perfectly confident that they made no mistake. — Again, a man of reserved and calm temperament, an old soldier, reported the day after a railway accident which he had witnessed, that there were at least one hundred dead, that he had himself on extricating himself from the smashed carriage seen many human heads, cut off by the wheels of the vehicles, rolling along the track. As a matter of fact, one man was killed and five persons wounded; all the rest was due to the imagination of a man ordinarily most composed, but at the moment suffering under strong excitement due to fear. — Another railway accident furnishes an example of what a man in a state of terror can see and hear. A brewer, a veritable Hercules, in the prime of life and in no way nervous, having jumped from the smashed carriage, took to running across the fields to the neighboring town, three quarters of an hour's distance, in the full belief that he saw and heard the locomotive of the train puffing and blowing after him. This

man, the prey to his imagination, had run so hard that he caught an inflammation of the chest, from which he died some months afterwards. The fact that he thus ran with such excess of vigor proves conclusively that in his imagination he had really seen and heard the pursuing locomotive. . . . It is interesting to note that in the murder of President Carnot by the Italian Caserio not a single person saw the blow struck, though the murderer had jumped upon the footrest of the carriage, pushed aside Carnot's arm, and thrust the dagger into his abdomen. In the carriage three gentlemen were seated, two grooms were standing behind, mounted officers were accompanying on either side, and yet no one saw the President stabbed; and the murderer would have easily escaped if he had refrained from calling out in a loud voice while running away: "Vive l'anarchie." . . .

If the statement of the witness appears improbable, and if at the time of the occurrence he was in a state of excitement, his story must be criticised with the most minute and scrupulous care. If the improbability of the statement is glaring, there is no difficulty, because we are at once put upon our guard. The danger arises when the observation of the witness has been at fault, when he tells in perfect good faith a most likely story, and thus creates great confusion. A long investigation ensues and only at the end of it, if at all, is the mistake discovered.

205. FRANCIS L. WELLMAN. *The Art of Cross-examination*. (1908. p. 149.) . . . Perhaps the most subtle and prolific of all of the "fallacies of testimony" arises out of unconscious partisanship. It is rare that one comes across a witness in court who is so candid and fair that he will testify as fully and favorably for the one side as the other. . . . What is it in the human make-up which invariably leads men to take sides when they come into court?

In the first place, witnesses usually feel more or less complimented by the confidence that is placed in them by the party calling them to prove a certain state of facts, and it is human nature to try to prove worthy of this confidence. This feeling is unconscious on the part of the witness, and usually is not a strong enough motive to lead to actual perjury in its full extent; but it serves as a sufficient reason why the witness will almost unconsciously dilute or color the evidence to suit a particular purpose, and perhaps add only a bit here, or suppress one there, but this bit will make all the difference in the meaning. Many men in the witness box feel and enjoy a sense of power to direct the verdict towards the one side or the other, and cannot resist the temptation to indulge it and to be thought a "fine witness" for their side. I say "their" side; the side for which they testify always becomes their side the moment they take the witness chair, and they instinctively desire to see that side win, although they may be entirely devoid of any other interest in the case whatsoever. It is a characteristic of the human race to be intensely interested in the success of some one party to a contest, whether it be a war, a boat race, a ball game, or a lawsuit. This desire to win seldom fails to color the testimony of a witness and to create fallacies and inferences dictated by the witness's *feelings*, rather than by his *intellect* or the dispassionate powers of observation. Many witnesses take the stand with no well-defined motive of what they are going to testify to, but upon discovering that they are being led into

statements unfavorable to the side on which they are called, experience a sudden dread of being considered disloyal, or "going back on" the party who selected them, and immediately become unconscious partisans and allow this feeling to color or warp their testimony.

There is still another class of persons who would not become witnesses for either side unless they felt that some wrong or injustice had been done to one of the parties, and thus to become a witness for the injured party seems to them to be a vindication of the right. Such witnesses allow their feelings to become enlisted in what they believe to be a cause of righteousness, and this in turn enlists their sympathy and feelings and prompts them to color their testimony, as in the case of those influenced by the other motives already spoken of. One sees, perhaps, the most marked instances of partisanship in admiralty cases which arise out of a collision between two ships. Almost invariably all the crew on one ship will testify in unison against the opposing crew, and, what is more significant, such passengers as happen to be on either ship will almost invariably be found corroborating the stories of their respective crews. It is the same, in a lesser degree, in an ordinary personal injury case against a surface railway. Upon the happening of an accident the casual passengers on board a street car are very apt to side with the employees in charge of the car, whereas the injured plaintiff and whatever friends or relatives happen to be with him at the time, will invariably be found upon the witness stand testifying against the railway company.

206. RICHARD WHATELY. *Elements of Rhetoric; comprising an Analysis of the Laws of Moral Evidence.* (ed. 1893. p. 83.) . . . A man strongly influenced by prejudice, to which the weakest men are ever the most liable, may even fancy he sees what he does not. And some degree of suspicion may thence attach to the testimony of prejudiced, though honest, men, when *their prejudices are on the same side with their testimony.* Otherwise, their testimony may even be the stronger. *E.g.* the early disciples of Jesus were, mostly, ignorant, credulous, and prejudiced men; but all their expectations — all their early prejudices — ran counter to almost everything that they attested. They were, in that particular case, harder to be convinced than more intelligent and enlightened men would have been. It is most important, therefore, to remember — what is often forgotten — that Credulity and Incredulity are the *same* habit considered in *reference to different things.* The more easy of belief any one is in respect of what falls in with his wishes or preconceived notions, the harder of belief he will be of anything that opposes these.

207. ROBERT HAWKINS' CASE. (G. L. CRAIK. *English Causes Célèbres.* 1844. p. 141.)

[The defendant, a clergyman, was charged with robbing one Larimore of money and jewelry. The defendant maintained that, owing to a dispute over church tithes, Larimore and others, including certain local magnates of an opposing faction, had concocted this charge of

robbery. Lord HALE presided at the trial at Aylesbury in 1668. The defendant, to prove Larimore's bias, called the village cobbler.]

John Chilton. — My Lord, I can say nothing, but that I am paid for my boots.

L. C. B. — What boots? *Chil.* —

My Lord, I am paid for my boots.

L. C. B.—Our business is not now about boots; but, however, come and tell me what thou meanest by them. *Chil.*—My Lord, Mr. Hawkins brought me a pair of tops, to put new legs to them, which I did, and he, coming by my shop, told me he wanted his boots; I replied, they were done; but I, being then about to go out, did promise Mr. Hawkins to lay them, in my window, so that he might take them as he went home, which, accordingly, he did; and when I came home I went to Mr. Hawkins, who at that time was at Sir John Croke's house, where he contented me for my work before we parted; and this is all that I can say, my Lord.

L. C. B.—What is this to the purpose? Can you say any more, Chilton? If you can, go on. *Chil.*—My Lord, Mr. Hawkins paid me honestly for the boots; but as soon as he began to demand the tithes of (the parish of) Chilton, and did sue for them, then they lay at me night and day to have me charge Mr. Hawkins with flat felony for stealing the said boots out of my shop; but I told them that I laid them in my shop window for him, and did bid him take them as he came back; and he paid me for my work, and, therefore, I cannot say that he stole them.

L. C. B.—Who were they that desired you to charge Mr. Hawkins with stealing of your boots? *Chil.*—This Larimore, Mr. Dodsworth Croke, Richard Mayne the Constable, Miles, and John Sanders (who is since dead, my Lord). . . .

L. C. B.—Did this Larimore desire you to charge this Mr. Hawkins with felony? And when did he desire you to do so? *Chil.*—My Lord, Larimore and the rest that I have named desired me to charge Mr. Hawkins with flat felony, for stealing the said boots, as soon as he demanded the tithes of Chilton; and they would have forced me to

fetch a warrant from a justice of peace to search for them, and did further threaten me, in case I would not do it, that Sir John Croke would indict me to the assizes, as one accessory to the stealing of my own goods.

L. C. B.—Was Larimore one of them? *Chil.*—Yes, my Lord, and he said that he would make me swear that Mr. Hawkins had stolen my boots, and for that end did serve me with a subpoena to be here.

Here *Larimore* the second time interrupted Chilton, and said, My Lord, this fellow (pointing at John Chilton) is hired by Mr. Hawkins to swear this. *Chilton* replied, No, my Lord, I am not hired by Mr. Hawkins to swear, but I might have been hired or borne out, if I would but swear that Mr. Hawkins stole my boots, by one Croxstone.

L. C. B.—How! what is that! hired or borne out to swear? By whom, and how? Tell me the story. *Chilton.*—My Lord, Thos. Croxstone, of Weston-on-the-Green, in the county of Oxon, told me upon Monday last, it being the 8th of March, 1668, that if I would but swear what he would have me against Mr. Hawkins (viz. that he stole my boots) he would bear me harmless; but I replied that it went against my conscience to do it . . . : to which Croxstone replied, that if I would swear it he would bear me out against the said Mr. Hawkins as far as an hundred pound would go, and if that would not do, as far as five hundred pound would go.

L. C. B.—I do not believe it to be true. *Chilton.*—As I live and breathe, my Lord, Croxstone did say, if I would swear that Mr. Hawkins stole my boots, he would bear me out, as I said before, and if I made any doubt of it, he would give me bond to make good his promise.

L. C. B.—This is strange. *Croxstone.*—My Lord, I said I would bear him out in speaking the truth, and no otherwise.

Hawk.—My Lord, may I be heard? *L. C. B.*—Yes, you may go on.

Hawk.—I thank your honor. My Lord, pray let me ask Mr. Croxstone two or three questions. *L. C. B.*—So you may; go on.

Hawk.—Mr. Croxstone, do you confess that you did promise to bear out Chilton (as you said before) in swearing the truth? *Croxstone.*—Yes, Sir, I did, and no otherwise.

Hawk.—Was it not about the boots? *Croxstone.*—Yes, Sir, it was so.

Hawk.—Did not you desire Chilton to swear that I had stolen his boots, after that he had told you I had paid him for them, and thereupon promise to bear him out against me, in £100 or £500. *Croxstone.*—I think you cannot prove it against me.

Hawk.—I pray, my Lord, . . . I have two witnesses more to prove the same against Mr. Croxstone, and I pray that they may be heard.

L. C. B.—What, more boots still! . . .

L. C. B. HALE then addressing the prisoner said: Sir, you have heard the indictment against you, and the evidence to prove it; you have heard the charge—now say what you can for your own defense, and you shall be heard. . . .

Hawkins.—Larimore is generally known to be a notorious Anabaptist, and an enemy to the church of England, and a hater of the ministry in general; but more particularly, he is more envious and malicious against myself, because I sued him for tithes, and caused him to be indicted for not coming to church, or baptizing his children; for which reason his malice against me hath appeared notorious several ways; as amongst others—

1. By dissuading all that owed me any money, not to pay me.

2. By his inducing those to whom I owed money to arrest and trouble me.

3. By dissuading those that I sued for tithes not to agree with me; he promising that Sir John Croke and himself would force me to run the country ere long.

4. By his continuing tormenting and vexing me with his false arrests, and illegal indictments.

5. By his constant endeavor to dissuade my friends from anyways relieving me or mine in my greatest wants and necessities—advising them to starve us.

[After several witnesses called by Hawkins to prove the conspiracy to drive him from the parish and ruin him, the following scene ensued.] . . . *Hawk.*—I have one witness more that I desire may be called, viz. Mr. Samuel Brown.

L. C. B. HALE.—Yes, yes, call him; come, Mr. Brown, what can you say? *Mr. Brown.*—My Lord, I can say something, but I dare not speak.

L. C. B.—Why dare you not? Come, speak the truth and spare not, and say no more. *Mr. Brown.*—I dare not speak, for Sir John Croke and this Larimore have threatened me, that if I came down to this assize to testify what I heard about this plot, Sir John Croke said he would fling me in the jail, and load with me action upon action of £1000, and ruin me and my family.

When the judge and the justices heard Mr. Brown relate this, every eye began to be fixed upon Sir John Croke. . . .

Lord Chief Baron.—Come, Mr. Brown, let us now hear what you say to this business.

Mr. Brown.—If it please your Honor, my Lord, upon Wednesday, the 16th of September last past, early in the morning, as I lay in my bed at Sir John Croke's house in Chilton . . . I heard this Larimore tell Sir John Croke that he had undone him, by causing him to contend with the parson. . . . Sir John replied, If thou wilt but act, I will hatch enough to hang

Hawkins. Larimore replied, But how shall we bring this to pass? Sir John Croke made answer, Canst not thou convey some gold or silver into Mr. Hawkins's house, and have a warrant ready to search his house, and then our work is done? Larimore replied, Sir, if we could but bring this to pass, it might do well, but I know not how. Sir John Croke said to Larimore . . . Take Dick Mayne, the constable, who is one of us, and will do whatever we desire him, and go and search Mr. Hawkins's house, and there you will find these things; and then charge him with flat felony, and force him before me, and no other justice, and I'll send him to jail without bail; and we will hang him at the next assizes. . . .

L. C. B. — Gentlemen, where is this Sir John Croke? They replied, He is gone.

L. C. B. — Is Sir John Croke gone? Gentlemen, I must not forget to acquaint you (for I thought that Sir John Croke had been here still) that this Sir John Croke sent me this morning two sugar loaves for a present, praying me to excuse his

absence yesterday. I did not then know, so well as now, what he meant by them; but to save his credit, I sent his sugar loaves back again. Mr. Harvey, did you not send Sir John his sugar loaves back again?

Clerk of the Assize. — Yes, my Lord, they were sent back again.

L. C. B. — I cannot think that Sir John Croke believes that the king's justices come into the country to take bribes. I rather think that some other person (having a design to put a trick upon him) sent them in his name. And so taking the letter out of his bosom, showing it to the justices, he said, Gentlemen, do you know this hand? To which some of them replied, they believed it might be Sir John Croke's own hand; which letter being compared with his mittimus (for he had no clerk) and some other of his writings there, it plainly appeared to be his own hand. So my Lord Chief Baron seeing that (putting up the letter into his bosom) said, he intended to carry that to London; and he added further, that he would relate the foulness of the business as he found occasions for it.

208. MARY BLANDY'S TRIAL. (1752. HOWELL'S *State Trials*. XVIII, 1153, 1164.)

[Mary Blandy was tried for murdering her father by poison. Her defense was that she had given him a love philtre, at her lover's instance, to remove her father's objections to her marriage with the lover. A house servant, Elizabeth Binfield, was a strong witness to prove that the accused had knowingly given poison to her father. Then Binfield was sought to be discredited by her bias against the accused]. . . .

Elizabeth Binfield sworn. *Binfield.* — I was a servant to Mr. Francis Blandy at Henley, and had been almost three years.

Counsel. — Did you ever hear Miss Blandy talk of something in the house, which she said presaged his death, or something like it?

A. I have often heard her talk of walkings and music in the house that she had heard; she said, she thought it to be her mother; saying, the music foretold her father's death.

Q. Do you remember any expression she made use of about her father? *A.* I heard her say, "Who would grudge to send an old father to hell for £10,000." Exactly them words.

Q. When was this? *A.* It was about a month before his death, or it may be more, I cannot justly tell.

Q. How was this conversation introduced? *A.* She was speaking of young girls being kept out of their fortunes.

Q. Who was with you at this time? *A.* It was to me and nobody else.

Q. Have you heard her use him with bad language? A. I have heard her curse him, call him rascal and villain. . . .

Ann James sworn, for the prisoner. *James.* — I live at Henley, and had use to wash for Mr. Blandy; I remember the time Mr. Blandy grew ill; before he was ill, there was a difference between Elizabeth Binfield and Miss Blandy, and Binfield was to go away.

Counsel. — How long before Mr. Blandy's death? A. It might have been pretty near a quarter of a year before; I have heard her curse Miss Blandy, and damn her for a bitch; and said she would not stay. Since this affair happened, I heard her say, "Damn her for a black bitch, I shall be glad to see her go up the ladder, and swing."

Q. How long after? A. It was after Miss was sent away to jail.

(*Cross-examined.*) *King's Counsel.* — What was this quarrel about? A. I do not know. I heard her say she had a quarrel, and was to go away, several times.

Q. Who was by at this time? A. Mary Banks was by, and nurse Edwards, and Mary Seymour; and I am not sure whether Robert Harman was there, or not. . . .

Elizabeth Binfield was called up again. *King's Counsel* — Did you, Elizabeth Binfield, ever make use of such an expression as this witness has mentioned? A. I never said such words.

Q. Did you ever tell this witness Miss and you had quarreled? A. To the best of my knowledge, I never told her about a quarrel.

Q. Have you ever had a quarrel? A. We had a little quarrel some time before.

Q. Did you ever declare you were to go away? A. I did.

Mary Banks sworn. *Banks.* I remember being in Mr. Blandy's kitchen in company with Ann James.

Counsel. — Who was in company? A. I do not remember.

Q. Do you remember a conver-

sation between Elizabeth Binfield and Ann James? A. I do not remember anything of it.

Q. Do you remember her aspersing Miss Blandy's character? A. I do not recollect.

Q. Did you hear her say, "She should be glad to see the black bitch go up the ladder to be hanged"? A. She did say, "she should be glad to see the black bitch go up the ladder to be hanged."

Q. When was this? A. It was the night Mr. Blandy was opened.

Q. Are you sure it was that day? A. I am sure it was.

Q. Where was Miss Blandy then? A. She was then in the house. . . .

The Honorable Mr. Bathurst's Argument in Reply for the Prosecution. Your lordships will, I hope, indulge me in a very few words by way of reply. . . . I will only make one other observation, which is that of all our witnesses she has attempted to discredit only one. She called two persons to contradict Elizabeth Binfield in regard to a scandalous expression (which she was charged with, but which she positively denied ever to have made use of) in saying, "She should be glad to see the prisoner go up the ladder, and swing." They first called Ann James; she swore to the expression, and said, It was after Miss Blandy was sent to Oxford jail. The next witness, Mary Banks, who, at first, did not remember the conversation, and, at last, did not remember who were present, said (upon being asked about the time) that she was sure the conversation happened upon the Thursday night on which Mr. Blandy was opened, and during the time that Miss Blandy was in the house. These two witnesses, therefore, grossly contradict one another; consequently ought not to take away the credit of Elizabeth Binfield. And let me observe, that Elizabeth Binfield proved nothing (besides some few expressions used by Miss Blandy), but what was confirmed by the other maid servant, Susan Gunnell.

209. CHARLES C. MOORE. *A Treatise on Facts, or the Weight and Value of Evidence*. (1908. Vol. II, §§ 1037, 1041, 1113, 1115, 1121). *Proclivities of Biased Witnesses*. Exaggeration is the most common vice of biased witnesses. They "make mountains of molehills," said Lord Stowell. "Although they may be honest in their purpose," said another judge, "they cannot, while human nature remains unchanged, overcome the tendency to distort, magnify, or minimize the incidents which they relate as their interest persuades." "A feature often attendant on the trial of collision cases" is "a tendency on the part of the witnesses for both sides to exaggerate in respect to points supposed to be vital and controlling." . . . If a biased witness testifying in impeachment of testamentary capacity had seen the testator a few times guilty of indecencies in the streets, he would club them together in his mind and would describe the conduct as a constant and perpetual habit. He will give the impression that single acts of eccentricity occurring, perhaps, at long intervals during many years, represented the testator's general conduct. Contestants of a will on the ground of testamentary incapacity due to intemperate habits would be likely to exaggerate them greatly; if the testator was occasionally or frequently intoxicated, they will say he was never sober. . . . "Nothing is more deceitful than half the truth," and biased witnesses are much addicted to half truths and false coloring of facts. Thus, a biased witness seeking to establish testamentary capacity of a dying testator may testify that the latter was able to sit up, and sat up for several minutes before he died, while it was a fact, known to the witness, that the testator could not lie down, but for two or three days had been artificially bolstered up, both before and behind. A witness testified that a testator, on returning home at night, instead of ringing the bell, would throw stones at the house; the fact being that on one occasion, when he was locked out, he threw a stone to attract attention that he might be let in. In a collision case the mate of a vessel testified that he "called the captain"; which, for a moment, was taken in its common sense, like calling a man to take his turn on deck, but by an accidental further question it turned out to mean, called him but could not make him hear; the fact being he could not wake him. Biased witnesses may speak what is not true, by an indifference to exactness in what they do say. Thus, a party may swear on his motion for a new trial that he did not know he could prove certain facts by a witness named until a specified date; whereas his conscience in thus swearing is satisfied by the mental reservation that he did not know until that date that the witness would recollect the transaction.

The unconscionable impositions that biased witnesses will perpetrate, without subjecting themselves to punishment for perjury — impositions that can be detected only by extraordinary sagacity of counsel if it happens that the witness alone knows the truth — are well illustrated in the case of a contested will in Pennsylvania. It was contended that the testatrix had conceived an insane hatred of her child, originating in causes which preceded its birth. As evidence of this uncontrollable hatred, a witness testified that the boy was shut up in a dark room with a shade over his eyes, which, the witness hinted, was intended to make his appearance eccentric. Yet it was a fact, known to the witness but not disclosed by him, that the boy was often tormented with weak eyes, and was even sent to the country to strengthen them, and that his confinement in a dark room was an effort

to relieve his sufferings, which was distorted by the witness into an act of barbarity. Surely, to such a witness the maxim "*falsus in uno, falsus in omnibus*," should be applied as unhesitatingly as to a witness who has corruptly testified to something entirely destitute of truth. Such a witness is more dangerous than one who commits a gross perjury, which is frequently more easily detected and exposed.

And the parson made it his text that week, and he said likewise
That a lie which is half a truth is ever the blackest of lies;
That a lie which is all a lie may be met and fought with outright,
But a lie which is part a truth is a harder matter to fight.

— TENNYSON, "The Grandmother," VIII.

Sources of Bias. *Near relationships* between a witness and the party for whom he testifies is an influence which, common experience teaches us, tends to bias consciously or unconsciously the testimony of witnesses. "The difference between a direct pecuniary interest in the witness, and the interest of love and affection growing out of the closest family ties between the witness and the party pecuniarily interested, while theoretically wide, is not, in the majority of cases, of real importance." Husbands and wives testifying in behalf of each other, especially in criminal cases, "would be unnatural and unworthy if they did not feel a very strong bias in favor of their consorts." But relationship alone is not a sufficient ground for imputing perjury. . . . A desire to wreak out *feelings of personal vengeance* and anger is often a stronger incentive than any pecuniary interest could be, and the trier of facts should "watch narrowly and receive cautiously" the testimony of a witness who is at enmity with the party against whom he testifies. . . . The trier of facts should carefully scrutinize the story of a witness with a grievance; for example, the testimony of one who claims that the party has ill-used him, or the testimony of a discharged servant or employee.

Queen Katherine. If I know you well,
You were the Duke's surveyor, and lost your office
On the complaint o' th' tenants: take good heed
You charge not in your spleen a noble person,
And spoil your nobler soul.

"King Henry VIII," Act I, Sc. 2.

A New York judge said that whoever has witnessed in our courts the operation of the law by which *parties* and those directly and *most strongly interested* in suits are permitted to testify therein, must have been convinced that it has opened a wide door for the perversion of the truth, and placed before litigants a temptation to falsehood and perjury most difficult to resist. It is far more probable that an interested party has committed perjury than that half a dozen or more witnesses on the other side have concocted a wicked falsehood. Where the plaintiff in an action on a fire insurance policy was charged with arson and testified in his own behalf, the court reminded the jury that "his moral, social, and business standing for his future life is involved in your finding, and you could hardly expect, from your knowledge of human nature, that a man in such straits would tell the truth if the truth would injure his case." But the fact that witnesses are parties to a suit or have a large pecuniary interest therein does not necessarily discredit their testimony, although it furnishes a reason why it

should be carefully considered and scrutinized. Satisfactory demeanor, intrinsic probability of their statements, and the absence of any direct contradiction, should unquestionably entitle them to belief. Testimony is not to be disbelieved merely because the witnesses are *servants of the party* for whom they testify; for example, employees of a defendant railroad company in an action to recover damages for personal injuries. "The personal interest which such a relation might possibly create is not to be overlooked in weighing their evidence, but that their statements are to be utterly discredited or disregarded because of that fact is a conclusion which jurors are much too ready to adopt, and which neither reason nor experience warrants." Testimony of a servant attempting to exonerate himself from a charge of negligence should not be disbelieved upon a mere assumption that he is committing perjury. But if a court concluded there was perjury somewhere, it would rather impute the offense to a servant making an improbable statement in exoneration of himself from heavy responsibility for negligence, than charge with intentional falsehood a considerable number of opposing witnesses not obsessed by so strong an influence. In a collision case between vessels Mr. Justice Grier said: "It is vain to expect the truth from the steersman or pilot of the colliding boat. He will not admit that he was drunk or asleep, or paying no attention, and not keeping a proper lookout." . . . In a case in Vermont against a railroad company where it was a question whether the bell on the defendant's locomotive was rung just before the plaintiff was injured, servants of the defendant testified that it was rung, and the plaintiff's counsel (now a member of the United States Commerce Commission) made the following sarcastic comments in his argument to the jury: "I don't know how many suits in which railroad companies were involved you may have heard tried, but it is a general rule that the bell *always* rings. There is no case on record in which the bell did not ring. . . . One of the stock questions which a railroad manager asks an applicant for employment is, 'Does the bell ring?'" . . . The fact that a witness is a *defendant in a criminal case* does not condemn him unworthy of belief, but at the same time it creates an interest greater than that of any other witness, and to that extent affects the question of credibility. If the punishment prescribed for the offense or the disgrace of guilt is severe, the defendant would be under the strongest possible temptation to give evidence favorable to himself. The jury properly consider his manner of testifying, the inherent probabilities of his story, the amount and character of the contradictory testimony, the nature and extent of his interest in the result of the trial, and the impeaching evidence, in determining the measure of credence to which he is entitled.

210. JOHN C. REED. *Conduct of Lawsuits*. (1912. 2d. ed. § 50.) . . . We now add a quotation from Quintilian, which is more detailed in its directions, and which reads as if it were written by an experienced counsel of our time: "Let us allow plenty of time . . . and a place of interview free from interruption to the clients who shall have occasion to consult us. . . . Nor should the counsel be content with hearing only once: the client should be required to repeat the same things again and again; not only because some things might have escaped his memory at the first recital, especially if he be, as is often the case, an illiterate person; but also that we may see whether

he tells exactly the same story ; for many state what is false, and, as if they were not stating their case, but pleading it, address themselves not as to an advocate, but as to a judge. We must never, therefore, place too much reliance on a client ; but he must be sifted and cross-examined, and obliged to tell the truth ; for as by physicians, not only apparent ailments are to be cured, but even such as are latent are to be discovered, even though the persons who require to be healed conceal them, so an advocate must look for more than is laid before him. . . . A client is often ready to promise everything, offering a cloud of witnesses and sealed documents quite ready, and averring that the adversary himself will not even offer opposition on certain points. If it is therefore necessary to examine all the writings relating to the case, it is not sufficient to inspect them ; they must be read through ; for very frequently they are either not at all such as they were asserted to be, or they contain less than was stated, or they are mixed with matters that may injure the client's cause, or they say too much and lose all credit from appearing to be exaggerated."

This passage, both in its exhortation to look with a skeptical spirit into every part of the case and its warnings against the biased representations of the party, deserves the meditation of every lawyer. If the advice of the celebrated author was wise in his day, it is more valuable now.

211. AMOS C. MILLER. *Examination of Witnesses*. (Illinois Law Review. 1907. Vol. II, p. 244.) . . . *How to find out who are available witnesses to support your Client*. To successfully accomplish this involves, in the start, what is to my mind the most important part of a proper preparation of any case for trial, and that is to ascertain the exact truth and the whole truth regarding the case and the strongest features on your side of the controversy. To the novice in the trial of cases, this task seems very easy. All he has to do is to listen to his client's tale, swallow it whole, and tell him to bring as many witnesses as he can to swear to the same thing. He then goes into the trial confident and happy. But before the trial has progressed very far, he learns to his dismay that there is another story. He is surprised, chagrined, and angered to find that witnesses, apparently disinterested, are willing to come into court and boldly commit perjury. He cross-examines angrily, and to no purpose, except to gain the ill-will of the court and jury and to bring out corroborative circumstances against him which opposing counsel had failed to elicit. His own apparent discomfiture adds to his heavy burden, and he is defeated. He goes home reflecting on the degeneracy of mankind, the ignorance of the court and the evils of our jury system. But when time has cooled his ardor — and especially after he has had one or two more such experiences — he begins to wonder if his client did really tell the truth. That doubt, upon further reflection, gradually ripens into a conviction that his client did not tell him the truth ; and his pessimistic state of mind as to courts, jury, human nature, and things in general is thereby relieved.

After a few such experiences the young practitioner finds that getting at the truth, and all of the truth, far from being an easy matter, is a most difficult one ; and especially is this so in cases involving complicated facts, or where the matters in dispute have occurred some years before (as is quite commonly the case here in this county when cases are reached for trial).

In all men the memory is more or less subject to the will and to the wish. The farther away the events, the more active and potent are these influences. Many persons deliberately conceal from their lawyers unfavorable facts and deliberately misrepresent others. We should expect to find this disposition only among the ignorant; but the fact is we frequently find it among successful business men accustomed to deal with matters of importance. Sometimes so strong is this disposition of clients, to cover up pitfalls even when talking to their own counsel, and to color the facts, if not to misrepresent, that often it will be found necessary to tell the client that if he concealed anything or misrepresented or colored anything, his lawyer cannot be of the slightest help to him; whereas, if he would be careful to state all of the facts, especially all the unfavorable facts, he might still disclose a good case and a winning case.

Not only must the trial lawyer be careful in talking to his client, but also in talking to his client's witnesses, even those who are wholly disinterested. When a disinterested person is enlisted as a witness on one side of the case, his sympathies and desires naturally become involved with the person calling him; and when he discovers what things the litigant desires to prove, a witness, especially if the events are distant in time, is apt to unconsciously give a strong coloring to the facts and sometimes to remember things he did not see; and more often to innocently misrepresent things he did see. It is no uncommon thing at all for a lawyer to discover that a witness, who, while waiting for the trial, has been fraternizing with other witnesses in the same case, finally remembers that he saw things which the other witnesses saw, but which he did not and could not have seen, and did not claim to have seen when first talked to. That fact arises, not from an intention to deliberately falsify, but from the *desire to be an important element* in the case. This fact, I have no doubt, accounts for a large part of the false testimony that we find in our courts in so many of the important cases that are tried, and especially in the personal injury cases.

212. RICHARD HARRIS. *Hints on Advocacy*. (Amer. ed. 1892. p. 45.) Besides determining whether the witness be false or true, or an artful twister of facts, you will also ascertain whether he has a strong bias in one direction, or a prejudice in the other. If he have a strong leaning to the side of your opponent, you will have the less difficulty in disposing of him, because it will be easy to lead him on until his bias becomes so manifest and overpowering that the jury will discount his evidence, and to such an extent that, if the case depend upon him, they will throw it over altogether. A strong interest weakens the side on which it lies. It will therefore be clear that in cross-examining a witness of this kind it will be proper to elicit this at the earliest opportunity. If it comes last, it will be far weaker, because it will not altogether undo the effect which his evidence may have made upon the minds of the jury. *The interest a witness has in a case should therefore be shown early in the cross-examination*, if it has not been made manifest before.

But it may be the witness has no interest. He may nevertheless be a partisan; and partisanship is often stronger than self-interest, although the latter has somewhat erroneously, as it seems to me, been described as the most powerful principle influencing human actions. In a great number of cases there is something of partisanship, and you may take it as a rule

that an absolutely unbiased witness is rare. The strong partisan, however, is only produced by public matters, parochial disputes, boundary questions, quasi-political inquiries, medical cases, rating matters, running-down causes, and other investigations, where the witnesses seem naturally to take sides. You should remember that though a man may go into the witness-box under compulsion, he never gives his evidence without a motive. It may be a strong or a weak one, but it exists; find that out, and you will be able to do so if you watch and listen attentively. The man whose motive is simply to speak what he knows, manifests it in every tone, look, and word. You will not have much difficulty in dealing with him. If you believe in your own case, you may believe in this witness not to injure it if you are discreet in examining him; that is, if you examine in such a manner that his answers cannot be misunderstood. But what are you to ask him? Listen to his evidence: if it agrees with your case, *nothing*; if not, note the points that are against you. And in dealing with the modes of cross-examining the different kinds of witnesses further on, I will endeavor to point out the manner of dealing with a witness who has a pure motive, but whose evidence conflicts with your case.

But suppose the witness has some other motive in giving his evidence. You will endeavor to ascertain what it is. If you watch carefully, you will find a difference in tone and manner when he is speaking more directly from the particular motive. Suppose it's revenge? Any point which seems more particularly to damage his adversary will be laid stress upon. Any answer that he makes which he thinks will damage him will be uttered in a more ready tone and with evident satisfaction. It will manifest itself in his voice, in his look, and his whole demeanor. *That*, therefore, must be stamped upon the mind of the jury by your cross-examination. . . .

The truthful witness has been said to be the most difficult of all to cross-examine. I cannot help differing so much from that opinion as to say that I have always regarded him as the easiest of any. When I say *truthful*, I do not intend to imply that his evidence is necessarily true. If it were so, it would be idle to cross-examine at all. What I mean by a truthful witness is one who believes and intends his evidence to be true. He is the easiest to deal with, because he does not equivocate or prevaricate. He has no secret meaning, and gives his answers readily and without mental reserve. He desires to tell you all he knows, and his credibility, I will assume, is unimpeachable.

The first thing to ascertain in cross-examining a witness of this class, is whether he has any strong *bias* or *prejudice* in the matter under inquiry. One or two carefully worded questions will discover this, if you have not already learnt it from his answers-in-chief. Suppose, for example, he is a clergyman, and the question is as to a certain place of entertainment being a nuisance either as being badly conducted or conducing to immorality. He tells you truthfully enough what he has seen, and speaks with indignant or pathetic tones of the vicious example to the inhabitants of the neighborhood. . . . If he has not referred to particular instances, you may safely proceed to lead him to condemn all places of public amusement of a similar kind. If you lead him gently, he will follow with remarkable docility. I have seen this course pursued by eminent leaders with great success. A man who condemns all alike is not the witness to impress a jury with the

value of his evidence in the particular instance, especially where it is far more a matter of opinion than fact. Even fact itself may be represented as so shocking by a witness of this kind as to create laughter instead of indignation. I once heard . . . a clergyman describe the conduct of two individuals as *debased and disgusting*; when questioned as to what they were doing, he said, with great solemnity, "he saw the man kiss the girl and hold her hand." On being asked if he had never been guilty of similar conduct in his earlier days, he declined to answer, and amid an outburst of laughter said, "*But the girl was a Sunday school teacher.*" This not being enough to produce the effect he innocently anticipated, he threw into the scale, as a final circumstance of depravity, the fact that, at the time, *he believed* the young man was paying his addresses to another young woman.

213. A. G. W. CARTER. *The Old Court House [in Cincinnati]*. (1880. p. 412.) It is a solemn truth — regret it as we may — that preachers make bad, very bad, witnesses in court. It would seem that in the efforts of their life, they deal with so much of uncontradicted fancy, instead of fact, that they cannot tell how a fact transpired when they are called upon the witness stand. I remember more than one case in the old court and courthouse, where preachers were called to testify, and they invariably spoiled the broth. On one occasion in a murder trial, which created in the community the most intense interest, and the greatest excitement, a certain distinguished Methodist preacher was called upon to testify for the State, and he did do so "with a whereas." He in his testimony, as was very plainly to be seen, was for hanging the poor prisoner, and upon this point (he by no means wished to hang the jury), therefore, he was most absolute and positive in his declarations, and became so dogmatic, that the Court upon the call of the attorney for the defense stopped the witness and finally made him take his seat in the witness box. Now this witness colored everything he said with the fancies of his profession. . . . At one time he said, "the deceased trusted the defendant, and had all confidence in him, but the prisoner was a Judas to him, and stabbed him to the heart, and set his house on fire," and this was said as the truth and the fact by the preacher witness, and yet he did not see it, or know it. He only knew of some surrounding circumstances, and he testified to these so lamely and unfashionably, that the dogs would have barked at him if they could have understood how he was giving in his testimony. In the same case another preacher testified, as he happened to know some important items, and he being the preacher of my own church, I expected something better than he gave. He, too, could not testify to the plain facts which he saw before him, however, but he continually colored them with his peculiar and particular views as a preacher over a congregation. . . . Avoid preachers, then, as witnesses, we somewhat serio-comically say to lawyers — they are not good witnesses — they are bad, very bad, witnesses — almost as bad, good brethren, as doctors, and lawyers, and we all well know that they, the doctors and the lawyers, make the very worst of witnesses in any case in any court.

214. N. W. SIBLEY. *Criminal Appeal and Evidence*. (1908. p. 202.) . . . One very remarkable feature of Courvoisier's trial [*ante*, No. 144] is the discredit that attached to the police. From the moment they were called in

they directly charged Courvoisier with the crime. There is thus considerable ground for concluding that he was both terrorized and entrapped into a confession, and this before the reward was offered. He was told he had made a terrible mess of it, that an inmate of the house must have committed the crime, and that there was no doubt he would be brought to justice. Phillips, for the defense, directly insinuated that Courvoisier was the victim of a conspiracy among the policemen, anxious to divide the reward of £450 over his coffin. The summing up of TINDAL, C. J., renders it impossible to entirely reject this view. The Chief Justice directed the jury that the evidence of the policeman Baldwin was unworthy of credit ; this witness originally adopted the view that a burglary had been committed, and the cross-examination of Phillips was directed to proving that he changed his view when the fact that a large reward had been offered came to his knowledge. It was dangerous, TINDAL, C. J., declared, in such a serious inquiry to give any weight to this man's evidence. . . .

Nearly a quarter of a century before this trial, that great reformer of the criminal law, Sir Samuel Romilly, animadverted, in the House of Commons, on the mischiefs arising from rewards given upon convictions. In 1692 an Act for encouraging the apprehension of highwaymen was passed, and by Sec. 2 a reward of £40 was offered "to him that shall take an highwayman." This Act was repealed in 1828. In 1756, MacDaniel, Berry, and Jones were indicted for the willful murder of Joshua Kidden, by maliciously causing him to be unjustly apprehended, falsely accused, tried, and convicted for highway robbery, well knowing him to be innocent of the fact laid to his charge, with an intent to share to themselves the reward. The fact was plainly proved against them upon this indictment, and the special matter being set forth in the indictment, the Court suffered them to be convicted and sentenced to death. . . . The baleful influence that the very large reward offered for the conviction of the murderer of Lord William Russell exercised over the whole of the police evidence at the trial of Courvoisier is doubtless the implicit historical explanation of the following passage in Best on "Evidence": "The English Government has for many years discontinued the offering rewards for the detection of crimes, on the ground that persons committed crimes for the purpose of obtaining the rewards by false accusations of the innocent ; and the Home Office, though urgently requested to offer a reward for the discovery of a series of murders of women in Whitechapel in 1888, steadily refused to revive the practice on this ground."

215. RICHARD HARRIS. *Hints on Advocacy*. (1892. Amer. ed. pp. 91, 114.) *The Police*. As to the police in the witness box, I shall commence by saying, to counsel for an accused, As far as possible leave them alone. They are dangerous persons. They are *professional witnesses*, and in a sense that no other class of witnesses can be said to be. Their answers generally may be said to be stereotyped. All the ordinary questions have been answered scores of times by the well-disciplined, "active, and intelligent officer." Don't imagine, my young friend, that you are going to trip him up upon the path where his beat has been for many a year. He will perceive you coming while you are a long way off, and in all probability go out and meet you. Perhaps before you were born he answered the question you have just put. . . .

But try him with something just a little out of the common line by way of experiment. You see he looks at you as though he had got the sun in his eyes. He cannot quite see what you are about. And you must keep him with the sun in his eyes if you desire to make anything of him. Without accusing him even by implication of having no reverence for the sanctity of an oath, I must say that if he sees the drift of your questions, the chances are against your getting the answers you want, or in the form in which you would like them. He thinks it his duty to baffle you, and if you do not get an answer you don't want, it will probably be because the policeman is as young and inexperienced as you are.

To be effective with the policeman your questions must be rapidly put. Although he has a trained mind for the witness box, it is trained in a very narrow groove; it moves as he himself moves, slowly and ponderously along its particular beat; it travels slowly because of its discipline, and is by no means able to keep pace with yours, or ought not to be. You should not permit him to trace the connection between one question and another when you desire that he should not do so. If you ask him whether it was a very dark night, and the darkness has nothing whatever to do with the issue, he will commence a process of reasoning (invented at Scotland Yard) as to your motive, and what might possibly be the effect of his answer. While this mental exertion is going on, interrupt him suddenly with a question you have good reason for putting, and in all probability you will get something near the answer you require.

Policemen have a great deal of knowledge about the case, and a great deal of *belief*. The former you will find bad enough to deal with; but you must be careful not to elicit a large quantity of the latter: if you do, you may rest assured it will look so like fact that it will pass with the jury as such. You will be fortunate if it do not condense itself into fact by the time you get it.

Another matter there is to be on one's guard against, and that is, being overdone by police testimony. Very few policemen are really untruthful, I believe; and very few would unnecessarily "pile on the evidence" against a man. But all are zealous, and zeal is a force, as we all know, that will sometimes impel us beyond the boundary line of discretion. They require to be kept in with a steady and firm hand; for much zeal on their part, like too much anxiety on yours, is sure to operate against what the prosecution invariably calls "the interests of public justice."

The Private Detective. When the *private inquiry* man tells you that he made his inquiries by means of a gimlet and his eye, or that he saw behind the door through the keyhole; or distinguished voices that spoke whispers through brick walls, as if the object of the secret ones in this seclusion were to whisper expressly for the benefit of the inquiry man; he will have shown you enough to prove that he may be an anxious inquirer after truth, but not much of an artist in depicting it.

I always admire the wonderful boldness of these witnesses and their faith in human credulity. They seem to think they can make you believe that special miracles have been wrought for the purpose of carrying out their investigations.

The absolute positiveness with which this witness gives his evidence is a point in your favor; the impossibility of his having been mistaken is

another: simply because the jury will not believe in the infallibility of a human being in carnal matters. And if the witness *might* have been mistaken, they will not believe him either. So that the circumstances under which the detective has made his discovery are matters worthy of your skill.

With him suspicion is *almost* guilt, and almost every circumstance from his point of view is suspicious.

In a charge of arson against a shoemaker who had a small workshop in a village, this mode of proceeding by suspicion was demonstrated in a remarkable manner. The man's shop consisted of one room separated from other buildings. He worked there in the day, and left it locked up at night. His stock was worth about £50, and he had insured it for £70. A fire broke out at night after he had left, and burnt some of his stock, about £12 worth. Police came, but no suspicion rested upon him. He said he could not account for the fire; no one could have got in, as he had the key. A policeman, eager to convict *somebody*, finds this evidence:

1st. A policy of insurance, obtained on the day of the fire.

2d. A smell of paraffin all over the shop.

3d. Removal of a box to the prisoner's mother's on the day of the fire.

4th. Deaf man, who heard prisoner say, "I'm sorry you saw me move that box, as the police are making a fuss."

The explanation of these *suspicious* circumstances was this: The premium for insurance had been paid *months before*. The prisoner being at the insurance office on the day of the fire on other business, the manager said, "*You may as well have your policy.*"

The paraffin was burnt in lamps in the shop; and was used to clean the furniture: *had been used on that day* for the purpose. The rag so used was lying on the drawers, hence the smell of paraffin.

There had been a fire in the grate on that day.

The box taken to the mother, belonged to her; she had asked for it, and it was proved to have been empty when taken.

The deaf man broke down in cross-examination, although he had come up to the mark in his examination by the clever policeman; and had been somewhat intimidated by the language of that functionary.

Mr. Justice Stephen in summing up made these observations:

"If you *assume* that this man committed the crime, then there are a good many circumstances that look suspicious; but if you do not assume that he is guilty, then the circumstances are not suspicious, as they are easily accounted for."

This appears to me to be the exact point with regard to many of the facts that are *discovered* by the private inquiry man, as well as by your official detective. Once assume a person's guilt, and the most innocent circumstance will become invested with suspicion; many facts will be unconsciously exaggerated, first in the mind of the witness, and then in his evidence.

216. A. C. PLOWDEN. *Grain or Chaff; The Autobiography of a Police Magistrate*. (1903. p. 334.) One of the most difficult duties of a Magistrate is to judge fairly between conflicting statements — not to incline too much to the constable merely because he is a constable, and not to be opposed to the prisoner merely because he is a prisoner. . . .

A marked feature in a police constable — I might call it a useful defect —

is his lack of imagination. The absence of this quality tends to keep down exaggeration, and has a particular value in the witness box. Truth cannot be expressed too simply. It is dangerous to attempt to embellish it. More than once I have known a prisoner to be "run in" who on his way to the station has anxiously inquired the name of the Magistrate before whom he will appear on the morrow, and then on being informed he will express his satisfaction or his contempt for "Old Plowden," with a free indulgence in the vernacular. The constable will repeat it all in the witness box with an absolutely unmoved countenance, without the trace of a smile or the exhibition of the slightest feeling. It is his duty to report faithfully what a prisoner may say. This is all that is present to his mind — his duty. What the prisoner may have said from any other point of view, or how he may have said it, concerns him not at all, and has no effect whatever on his imagination.

It follows that as a rule police constables make very reliable witnesses. Their memory, too, is generally excellent, and it is very seldom they give any sign of undue feeling or prejudice. I feel under endless obligations to them not only for their assistance as truthful and intelligent witnesses, but generally for their never failing courtesy and the alacrity which they bring to the discharge of any duty that may be required of them.

SUBTITLE G: EXPERIENCE

220. JOSIAH ROYCE. *Outlines of Psychology*. (1903. p. 221.) We have only to consider the origin of our perceptions in order to become convinced that what at present our sense organs show us with regard to the object, not only constitutes but a small portion of what we know or may know about the object, but also has acquired its whole present meaning for us through processes that, in the past, have been as complex as those of the grasping child, or perhaps much more complex than his have yet become. Our present conscious perception of any object which impresses our sense organs is a sort of brief abstract and epitome of our previous experience in connection with such objects. . . . The total result of all such experiences is epitomized in the present instantaneous perception of this object. . . . What we mean by the perception of an object is a cerebral process involving features of the foregoing kinds. The substance of the matter is that the present sense disturbance is at once associated with a consciousness due to already established motor habits, which have been trained in the presence of objects similar to the one now present. These habits may be of the most various kinds, and the consciousness excited by the object may have the most various relations to the habits themselves. They were slowly acquired, by means of acts that took a considerable time, and that were associated with the varied and complex consciousness. The perception is relatively instantaneous. It is a case of simultaneous association. . . .

The practical application of all this is obvious. If you are to train the powers of perception, you must train the conduct of the person who is to learn how to perceive. Nobody sees more than his activities have prepared him to see in the world. We can observe nothing to which we have not already

learned to respond. The training of perception is as much a practical training as is the learning of a trade. And it is this principle upon which the value of all arts, such as those of drawing, of experimenting, and of workmanship, depends, in so far as such arts are used, as in all modern training is constantly done for the sake of developing the power to perceive. It is because he has played music that the musician so well perceives music. It is because of his habits of workmanship that the skilled artisan or engineer can so well observe the things connected with his trade. It is because they do not know what to do that the untrained travelers in a foreign land often see so little, and find what they had hoped to be a wealth of new experience a dreary and profitless series of perplexities.

221. HANS GROSS. *Criminal Investigation* (transl. Adam, 1907, p. 149); and *Criminal Psychology*. (transl. Kallen, 1911, pp. 229, 239, 388). A. *The Value of Experts*. Experts are the most important auxiliaries of an Investigating Officer; in some way or other they nearly always are the main factor in deciding a case. . . . But everything depends upon knowing how to make use of them. Indeed it is often less important to know *who* is to be questioned than to know *how, upon what, and when* questions must be put. But it is also an important thing for the Investigating Officer to know just whom he ought to apply to, *i.e.* what kind of expert he ought to select; moreover, he must know what the expert is capable of telling him in each case, that is to say, where his knowledge begins and what are the natural limits to it; and finally he must seize the proper moment for putting his question, *i.e.* the moment when he is in possession of sufficient material to render any further research superfluous. . . .

As regards the limits of the expert's knowledge, the Investigating Officer must be particularly careful not to ask too much, for if he were to do so he might look ridiculous; on the other hand, if he does not ask enough, he may deprive himself of information of great value. A case is recalled in which the Investigating Officer sought to know whether the blood stain on a piece of cloth was that of a boy or of a girl; another Investigating Officer took a stove to pieces and sent it carefully packed to the chemical examiner with a request to know whether bank notes had been burned in it or not; and a colleague of the author recently met with a case in which it was asked whether the arsenic found in the corpse could be identified with that found in a sausage. On the other hand, every Investigating Officer knows of cases in which the solution of problems, seeming to outsiders almost insoluble, has been obtained; in this way experts in physics will discover, by a magnetic process, traces of iron, where chemical experts have found nothing; botanists once furnished the author with certain proof that some branches of hops had been cut with a particular knife. What can be performed with the assistance of electricity, the refinements of photography, radioactive rays, Roentgen rays and other acquisitions, is simply illimitable. . . .

It must not be forgotten that to-day, in spite of, and perhaps because of, the great progress of science, people make statements with much less assurance than formerly. One has only to compare books on medical jurisprudence written thirty years ago with those of to-day to see that the writers of those days, acting upon a small number of cases at their disposal, did not hesitate to state general principles, the correctness of which are now much

shaken; for experimental science, now much more extensive, has found out so many exceptions that in the long run they sometimes become more numerous than the so-called rules. This principle must be applied to other domains, and we must not boast of our own knowledge, which is always more or less incomplete; if we do not know the exceptions ourselves, we have but to demand them of specialists. By conforming to this rule we will obtain astonishing results. The specialist will refute a well-established conviction, leading us to say, "I believe it is always thus," with a series of exceptions in which it is *not* always *thus*. In a recent case, medical experts who, on examination in the witness box affirmed positively that it was impossible for a cavity to form in lobar pneumonia, when confronted with authorities in cross-examination, admitted that such a thing was quite possible. If, therefore, experts themselves may be mistaken, how much more should the Investigating Officer be unashamed to question others upon things which seem beyond all doubt.

Moreover, the circle of experts must be enlarged as much as possible. Some Investigating Officers in many years have never made use of any other experts than doctors, analysts, and gunsmiths; it has never crossed their minds to consult workmen and artisans of all kinds. They have not thought that they might be able to obtain most precious information from such sources. The author must confess that he has often had business with experts without knowing at the outset what they might be able to tell him. He once sent for a cutler and gave him a knife found in the wound of a murdered person and asked him whether he could give any information about it; the cutler replied that such knives were only manufactured in the north of Bohemia. And this information brought about the discovery of the criminal. A turner pointed out that an article the criminal had left behind must have been turned by a left-handed person; the person arrested (who denied the crime) came from a distant town; search was made in that place for a left-handed turner, who, when found, identified the accused as the person who had bought the article from him. Linguists have indicated the nationality of the writer of a letter; a school-master has guessed the age of a bank-note forger, then unknown, from the mistakes in writing which he made; and astronomers have given the day in spring which, as regards the evening light, corresponded with a certain day in autumn. In the last case the Investigating Officer was able to visit a locality in spring in order to find out if the criminal would be able to see, and must have seen, such and such a thing at a certain hour on a certain day in the autumn. . . .

Often quite a series of workmen, etc., will have to be consulted when it is believed that some peculiarity is due to a certain kind of skill connected with some particular trade. One day, for an example, an important theft, extremely skillfully carried out, was committed in the following manner. A thief, a former servant of a banker who lived alone, had slipped during the daytime into the room next to the bedroom of his old master. The thief was aware that the banker was in the habit, before going to bed, of locking the door between his bedroom and the room where the former was hidden. He therefore resolved to wait until the old gentleman was asleep, then slip into the bedroom, take the key of the safe from the bed table, open the safe and complete the theft; which indeed he did. But, so as not to be

shut out in the room where he was hiding, it was necessary to make the banker believe that he had already locked the door of communication. The thief therefore shaped a small piece of wood to cork up the slot, or square opening, into which the bolt of the lock penetrates. When the banker went to lock the door before getting into bed, the bolt was unable to enter the hole in the doorpost, thus producing the same effect as if the door had been already locked; and indeed, the banker declared afterwards his belief that he had already locked the door without remembering having done so. The door therefore remained unlocked and the thief was able to carry out his project; but he had left the little piece of wood, which was prismatic in shape, in the slot, and it was shown to various experts. The first was a locksmith, who very sensibly remarked "the person who made this works more minutely than we do; it was not necessary to cork the hole with so much care; quite an ordinary little piece of wood would have done well enough, provided that it was of the proper length." A turner was then questioned, who on seeing the piece of wood was of opinion that its workmanship indicated a man who knew how to carve. A turner turns, but does not carve, and so it could not have been a turner was concerned in the theft. A wood carver was next questioned, and he was able by chance to indicate an instrument used exclusively by makers of boot and shoe trees. This instrument was procured, and the Investigating Officer was easily convinced of the accuracy of the wood carver's statements; and, on the result being communicated to the victim of the theft, the thief was easily found; in fact, the last servant whom the banker had dismissed had formerly been a tree maker, and indeed went back to that trade whenever he was out of a place. . . .

But, if experts are capable of informing the Investigating Officer on many points, care must at the same time be taken not to ask them (and especially medical ones) for too many or for too precise explanations. . . . Only those who have had long experience of them can know what qualities a good medical jurisperit should have; he ought certainly to be a specialist in all branches of medical knowledge, ought to know all the difficulties to be met with, and have special experience of criminals. It would not be fair to the medical jurisperit, who represents all branches of medical science, to pretend that any country doctor, even the very best, can be a medical jurisperit absolutely worthy of confidence. It is for this reason that the Investigating Officer should take care not to ask the medical man for too much. It is natural for a man to prefer to say "the thing is so" rather than "I do not know;" and, sometimes, the doctor will make precise replies when pressed by an Investigating Officer, replies which will not bear the examination of science. It has been necessary for the best-known professors in medical jurisprudence to boldly avow, "We do not know this, not yet that, and many other things besides" — and yet the scientists of former times used to make the most categorical statements. Take but a few examples. With what certainty did they not use to distinguish *ante mortem* from *post mortem* wounds? And yet every medical jurisperit of to-day points out most convincingly that the so-called distinctive signs are not always infallible. Again medical jurisperits used to determine very accurately the beginning and the end of a gash or cut, a point perhaps very important in a case of murder or suicide; modern medical men

In all men the memory is more or less subject to the will and to the wish. The farther away the events, the more active and potent are these influences. Many persons deliberately conceal from their lawyers unfavorable facts and deliberately misrepresent others. We should expect to find this disposition only among the ignorant; but the fact is we frequently find it among successful business men accustomed to deal with matters of importance. Sometimes so strong is this disposition of clients, to cover up pitfalls even when talking to their own counsel, and to color the facts, if not to misrepresent, that often it will be found necessary to tell the client that if he concealed anything or misrepresented or colored anything, his lawyer cannot be of the slightest help to him; whereas, if he would be careful to state all of the facts, especially all the unfavorable facts, he might still disclose a good case and a winning case.

Not only must the trial lawyer be careful in talking to his client, but also in talking to his client's witnesses, even those who are wholly disinterested. When a disinterested person is enlisted as a witness on one side of the case, his sympathies and desires naturally become involved with the person calling him; and when he discovers what things the litigant desires to prove, a witness, especially if the events are distant in time, is apt to unconsciously give a strong coloring to the facts and sometimes to remember things he did not see; and more often to innocently misrepresent things he did see. It is no uncommon thing at all for a lawyer to discover that a witness, who, while waiting for the trial, has been fraternizing with other witnesses in the same case, finally remembers that he saw things which the other witnesses saw, but which he did not and could not have seen, and did not claim to have seen when first talked to. That fact arises, not from an intention to deliberately falsify, but from the *desire to be an important element* in the case. This fact, I have no doubt, accounts for a large part of the false testimony that we find in our courts in so many of the important cases that are tried, and especially in the personal injury cases.

212. RICHARD HARRIS. *Hints on Advocacy*. (Amer. ed. 1892. p. 45.) Besides determining whether the witness be false or true, or an artful twister of facts, you will also ascertain whether he has a strong bias in one direction, or a prejudice in the other. If he have a strong leaning to the side of your opponent, you will have the less difficulty in disposing of him, because it will be easy to lead him on until his bias becomes so manifest and overpowering that the jury will discount his evidence, and to such an extent that, if the case depend upon him, they will throw it over altogether. A strong interest weakens the side on which it lies. It will therefore be clear that in cross-examining a witness of this kind it will be proper to elicit this at the earliest opportunity. If it comes last, it will be far weaker, because it will not altogether undo the effect which his evidence may have made upon the minds of the jury. *The interest a witness has in a case should therefore be shown early in the cross-examination*, if it has not been made manifest before.

But it may be the witness has no interest. He may nevertheless be a partisan; and partisanship is often stronger than self-interest, although the latter has somewhat erroneously, as it seems to me, been described as the most powerful principle influencing human actions. In a great number of cases there is something of partisanship, and you may take it as a rule

that an absolutely unbiased witness is rare. The strong partisan, however, is only produced by public matters, parochial disputes, boundary questions, quasi-political inquiries, medical cases, rating matters, running-down causes, and other investigations, where the witnesses seem naturally to take sides. You should remember that though a man may go into the witness-box under compulsion, he never gives his evidence without a motive. It may be a strong or a weak one, but it exists; find that out, and you will be able to do so if you watch and listen attentively. The man whose motive is simply to speak what he knows, manifests it in every tone, look, and word. You will not have much difficulty in dealing with him. If you believe in your own case, you may believe in this witness not to injure it if you are discreet in examining him; that is, if you examine in such a manner that his answers cannot be misunderstood. But what are you to ask him? Listen to his evidence: if it agrees with your case, *nothing*; if not, note the points that are against you. And in dealing with the modes of cross-examining the different kinds of witnesses further on, I will endeavor to point out the manner of dealing with a witness who has a pure motive, but whose evidence conflicts with your case.

But suppose the witness has some other motive in giving his evidence. You will endeavor to ascertain what it is. If you watch carefully, you will find a difference in tone and manner when he is speaking more directly from the particular motive. Suppose it's revenge? Any point which seems more particularly to damage his adversary will be laid stress upon. Any answer that he makes which he thinks will damage him will be uttered in a more ready tone and with evident satisfaction. It will manifest itself in his voice, in his look, and his whole demeanor. *That*, therefore, must be stamped upon the mind of the jury by your cross-examination. . . .

The truthful witness has been said to be the most difficult of all to cross-examine. I cannot help differing so much from that opinion as to say that I have always regarded him as the easiest of any. When I say *truthful*, I do not intend to imply that his evidence is necessarily true. If it were so, it would be idle to cross-examine at all. What I mean by a truthful witness is one who believes and intends his evidence to be true. He is the easiest to deal with, because he does not equivocate or prevaricate. He has no secret meaning, and gives his answers readily and without mental reserve. He desires to tell you all he knows, and his credibility, I will assume, is unimpeachable.

The first thing to ascertain in cross-examining a witness of this class, is whether he has any strong *bias* or *prejudice* in the matter under inquiry. One or two carefully worded questions will discover this, if you have not already learnt it from his answers-in-chief. Suppose, for example, he is a clergyman, and the question is as to a certain place of entertainment being a nuisance either as being badly conducted or conducing to immorality. He tells you truthfully enough what he has seen, and speaks with indignant or pathetic tones of the vicious example to the inhabitants of the neighborhood. . . . If he has not referred to particular instances, you may safely proceed to lead him to condemn all places of public amusement of a similar kind. If you lead him gently, he will follow with remarkable docility. I have seen this course pursued by eminent leaders with great success. A man who condemns all alike is not the witness to impress a jury with the

posed of woody fibrous matter finely pulverized; the deduction drawn was that the coat belonged to a carpenter, joiner, or sawyer, etc. But among the dust much gelatine and powdered glue was found; this not being used by carpenters or sawyers the further deduction was drawn that the garment belonged to a joiner, — which turned out to be in fact the case. . . .

(2) *The Chemical Analyst.* Here we may be brief; in effect, the chemist will be employed in all cases in which the microscopist may be called in. In many cases both are necessary, for there are few cases of a purely chemical category; the analyst has frequent recourse to the magnifying glass or microscope before or after his chemical work, for the purpose of completing or checking it. Conversely, the microscopist can hardly do analyst's work, and so we can only attain satisfactory results from the combined action of the microscopist and chemical analyst. Speaking generally we may say that the Investigating Officer does not employ the analyst or chemical examiner frequently enough, and that many cases which have remained in a state of obscurity would have taken another turn if the expert had been consulted. . . .

(3) *The Expert in Physics.* If the medical jurisprudent cannot enlighten us, if the microscopist and chemical analyst are incapable of elucidating the matter, recourse must be had to the expert in physics. The cases in which one can and ought to approach him are legion; no one would be able to completely enumerate them. . . . Speaking generally, it may be stated: the physicist must always be called in when it is important to determine the effect of the natural forces which have exercised any influence upon a matter within the purview of the Penal Code. It goes without saying that every man is capable of determining this effect; but the scientist can better observe it and with more accuracy and justice, especially in cases requiring special knowledge, such as those involving calculations and the use of scientific appliances. . . . The same may be said of a large series of optical questions, when, *e.g.*, it is desired to know how a light effect has been produced, what has been its action, what amount of light has been necessary for the perpetration of determinate acts, how a certain shadow has been produced, how far it has stretched, what object has caused it, at what moment of the day the sun has produced such and such an effect, or at what hour in the night the moon has shown in a particular manner, and a thousand other questions. In a recent case in the Cuddapah District a man who was attacked in the night was said to have been lying on his left side on a cot facing the northern and open side of a chavadi or shed, the foot of his cot being a few feet from its eastern wall. It was alleged the stabbing took place about midnight and just as the moon was rising, the injured man stating in the witness box that he was lying awake and "watching the moon rise" when his assailants came up and attacked him, and therefore he recognized them. No one in Court was able positively to say whether at that time of the year he could possibly have seen the moon which, if his story was true, must have been a very northerly one. Had this witness's story not been completely broken down and found to be false in other directions, it is probable that he would have been believed when he asserted that he saw the moon rising. It would have been impossible to have adjourned the case, which was a sessions one, to a date upon which the moon would have been in an equivalent position, and it is very doubtful

whether any physicist could have been summoned for that trial. But had the Investigating Officer taken the precaution of verifying beforehand the man's story by communicating with an expert in natural philosophy, there would have been no such difficulty as was raised in this trial upon this point. . . .

(4) *Experts in Mineralogy, Zoölogy, and Botany.* Experts in Mineralogy and Zoölogy are but little consulted by the Investigating Officer. . . . We must repeat that nowhere is there greater danger than when we neglect to call in the expert and ourselves dabble in the matter. No doubt the layman who observes closely will discover something and form correct conclusions, but the true working insight is only to be obtained and judged by the expert. The zoölogist finds important employment when the question arises of how long a man lying in the open has been dead, under what conditions animal life of various sorts (especially insects) appear at different times upon every corpse. If the death does not take place in the cold part of the year, certain flies at once appear, somewhat later certain beetles, etc., are found, until at last, sometimes after many months, certain animals bring about the final work of destruction of the non-osseous parts. In such circumstances the zoölogist can often afford important and reliable information. . . . It is for the botanist to play the greatest rôle; he can indicate poisonous or abortive plants, discovering the smallest pieces; he can determine the nature of powdered substances composed of plants, seeds, and fruits; he can study the juices of these plants and the preparations made therefrom. These indications are often important, especially when such vegetable matter is discovered in a house search or upon the person, or in the stomach and intestines of deceased persons, or the matter vomited or passed by them. It must not be forgotten that the smallest atom of leaf, the most minute piece of bark or fiber, suffices for the botanist to recognize the entire plant. . . .

(5) *Expert in Firearms.* As indicated above, the examination of firearms requires, more than anything else, the assistance of a whole series of different experts; as a rule only a gunsmith is called in, but this the author considers a mistake. Nowadays local gunsmiths no longer exist as in former times; they are as rare as the local clockmakers of old; for both the local gunsmith and clockmaker sell instruments they have received ready-made from the factory; at the most they have only placed the various parts of the instrument together and know how to do certain repairs. The firearm and the watch are made only in the factory, and the merchant or shopkeeper cannot be expected to understand in a special manner their interior mechanism. Even when dealing with a gunsmith who knows his trade, we find his knowledge restricted in most cases to being able to indicate the origin and the price of the weapon, the names of its different parts, and other mechanical details; which, it must be confessed, will have in most cases a certain value. But he will not be able to say much regarding the use to which the instrument may be put, the effects which it is capable of producing, the connection existing between the arm itself and the bullet employed, besides numerous other questions of capital importance. Recourse must therefore be had to the experienced sportsman, the medical man, the inspector of musketry, the physicist, the chemist, and the microscopist. In many other cases, moreover, where the question is to

determine the effect of a bullet on different substances, yet other experts who are conversant with these substances must be questioned; in many cases experts consulted by the author have been unable to give a satisfactory reply, when an ordinary workman has answered without hesitation. The dresser of stone can tell us the resistance of the various kinds of stone, the locksmith can explain to us how a certain effect has been produced upon iron, and the botanist can indicate with accuracy the time and the season at which a bullet has struck a living tree and lodged in the wood.

B. The Dangers of Expert Testimony. . . . The first question that arises when we are dealing with an important witness who has made observations and inferences, is this: "How intelligent is he? and what use does he make of his intelligence? That is, what are his processes of reasoning?" . . . We start, therefore, with some simple fact which has arisen in the case and try to discover what the witness will do with it. It is not difficult; you may know a thing badly in a hundred ways, but you know it well in only one way. If the witness handles the fact properly, we may trust him. We learn, moreover, from this handling how far the man may be objective. His perception as witness means to him only an experience, and the human mind may not collect experiences without, at the same time, weaving its speculations into them. But though every one does this, he does it according to his nature and nurture. There is little that is as significant as the manner, the intensity, and the direction in and with which a witness introduces his speculation into the story of his experience. Whole sweeps of human character may show themselves up with one such little explanation. . . . It is Hume, again, I think, who so excellently describes what happens when some inconceivable story is told to uncritical auditors. Their credulity increases the narrator's shamelessness; his shamelessness convinces their credulity. Thinking for yourself is a rare thing, and the more one is involved with other people in matters of importance, the more one is convinced of the rarity. . . .

Now, how are we to meet people of this kind when they are on the witness stand? They offer no difficulty when they tell us that they know nothing about the subject in question. If, however, he is not honest enough immediately to confess his ignorance, nothing else will do except to make him see his position by means of questions, and even then to proceed carefully. It would be conscienceless to try to spare this man while another is shown up.

This is important when the witnesses examined are experts in the matter in which they are examined. I am convinced that the belief that such people must be the best witnesses, is false, at least as a generalization. Benneke has also made similar observations. "The chemist who perceives a chemical process, the connoisseur a picture, the musician a symphony, perceive them with more vigorous attention than the layman, but the actual attention may be greater with the latter." For our own affair, it is enough to know that the judgment of the expert will naturally be better than that of the layman; his apprehension, however, is as a rule one-sided, not so far-reaching and less uncolored. It is natural that every expert, especially when he takes his work seriously, should find most interest in that side of an event with which his profession deals. Oversight of legally important matters is, therefore, almost inevitable. I remember how an eager young

doctor was once witness of an assault with intent to kill. He had seen how in an inn the criminal had for some time threatened his victim with a heavy porcelain match tray. "The os parietale may here be broken," the doctor thought, and while he was thinking of the surgical consequences of such a blow, the thing was done and the doctor had not seen how the blow was delivered, whether a knife had been drawn by the victim, etc. Similarly, during an examination concerning breaking open the drawer of a table, the worst witness was the cabinetmaker. The latter was so much interested in the foreign manner in which the portions of the drawer had been cemented and in the curious wood, that he had nothing to say about the legally important question of how the break was made, what the impression of the damaging tool was, etc. Most of us have had such experiences with expert witnesses, and most of us have also observed that they often give false evidence because they treat the event in terms of their own interest and are convinced that things must happen according to the principles of their trades. However the event shapes itself, they model it and alter it so much that it finally implies their own apprehension.

As regards the practical method of procedure in examining experts, care must be taken not to allow different experts to make their experiments at the same time and give their advice together. The Investigating Officer who is directing the inquiry easily loses a concise view of the case when one expert draws conclusions from one side and another from the other side; it is difficult to understand the work of each, and it is impossible to reconcile the different statements and the conclusions given upon the whole. . . . Once the experiments are made and the reports sent in, the Investigating Officer will be able, following the case and the results of the reports, to bring the experts together, either all at once or in several groups; in this way he will perhaps find the agreement or the explanation of doubtful question or questions resolved in different ways; when the experts are already *au courant* with the matter and know what they have to reply they will agree together much more readily than if they have been allowed to work together from the outset.

222. RICHARD WHATELY. *Elements of Rhetoric; comprising an Analysis of the Laws of Moral Evidence.* (ed. 1893. p. 259.) . . . In no way, perhaps, are men, not bigoted to party, more likely to be misled by their favorable or unfavorable judgment of their advisers, than in what relates to the authority derived from *Experience*. Not that Experience ought not to be allowed to have great weight; but that men are apt not to consider with sufficient attention what it is that constitutes Experience in each point; so that frequently one man shall have credit for much experience, in what relates to the matter in hand, and another, who, perhaps, possesses as much, or more, shall be underrated as wanting it.

The vulgar, of all ranks, need to be warned, *First*, — that *time* alone does not constitute Experience; so that many years may have passed over a man's head, without his even having had the same opportunities of acquiring it, as another, much younger; *Secondly*, — that the longest practice in conducting any business in *one* way, does not necessarily confer any experience in conducting it in a different way; *e.g.*; an experienced Husbandman, or Minister of State, in Persia, would be much at a loss in Eu-

rope; and if they had some things less to learn than an entire novice, on the other hand they would have much to unlearn; and, *Thirdly*, — that merely being conversant about a certain class of *subjects*, does not confer Experience in a case where the *operations* and the *end* proposed are different. It is said that there was an Amsterdam merchant, who had dealt largely in corn all his life, who had never seen a field of wheat growing; this man had doubtless acquired, by Experience, an accurate judgment of the qualities of each description of corn, — of the best methods of storing it, — of the arts of buying and selling it at proper times, etc.; but he would have been greatly at a loss in its cultivation; though he had been, in a certain way, long conversant about corn. Nearly similar is the Experience of a practiced Lawyer (supposing him to be nothing more) in a case of Legislation. Because he has been long conversant about Law, the unreflecting attribute great weight to his legislative judgment; whereas his constant habits of fixing his thoughts on what the law *is*, and withdrawing it from the irrelevant question of what the law *ought* to be; — his careful observance of a multitude of rules (which afford the more scope for the display of his skill, in proportion as they are arbitrary and unaccountable) with a studied indifference as to that which is foreign from his business, the convenience or inconvenience of those Rules — may be expected to operate unfavorably on his judgment in questions of Legislation; and are likely to counterbalance the advantages of his superior knowledge, even in such points as do bear on the question. Again, a person who is more properly to be regarded as an Antiquarian than anything else, will sometimes be regarded as high authority in some subject respecting which he has perhaps little or no real knowledge or capacity, if he have collected a multitude of facts relative to it. Suppose, for instance, a man of much reading, and of retentive memory, but of unphilosophical mind, to have amassed a great collection of particulars respecting the writers on some science, the times when they flourished, the numbers of their followers, the editions of their works, etc., it is not unlikely he may lead both others and himself into the belief that he is a great authority in that Science; when perhaps he may in reality know — though a great deal *about* it — nothing *of* it (see “Logic,” *Intro.*, § I, p. 3). Such a man’s mind, compared with that of one really versed in the subject, is like an antiquarian armory, full of curious old weapons, — many of them the more precious from having been long since superseded, — as compared with a well-stocked arsenal, containing all the most approved warlike implements fit for actual service. In matters connected with Political Economy, the experience of practical men is often appealed to in opposition to those who are called Theorists; even though the latter perhaps are deducing conclusions from a wide induction of facts, while the experience of the others will often be found only to amount to their having been long conversant with the details of office, and having all that time gone on in certain beaten tracks, from which they never tried, or witnessed, or even imagined a deviation. So also the authority derived from experience of a *practical* Miner, — *i.e.* one who has wrought all his life in one mine, — will sometimes delude a speculator into a vain search for metal or coal, against the opinion perhaps of *Theorists*, *i.e.* persons of extensive geological observation. It may be added, that there is a proverbial maxim which bears witness to the advantage sometimes possessed by an

observant bystander over those actually engaged in any transaction: "The looker-on often sees more of the game than the players." Now the looker-on (in Greek, θεωρέω) is precisely the *Theorist*.

223. SAMUEL S. PAGE. *Personal Injury Actions*. (Illinois Law Review, 1906. Vol. I, p. 35.) . . . There is a great field in the cross-examining of medical experts. Doctors who make a specialty of testifying for plaintiffs are very frequently both ignorant and vicious. They testify for contingent fees, and their evidence is frequently affected by their interest in the result. . . . It is sometimes easy to show the ignorance of some so-called "experts." Not long ago, in one of my cases, a doctor testified that he was a graduate of a medical college; was attending surgeon at a hospital and had been on its advisory board for some years; was professor of surgery in a clinical school, and had examined and treated plaintiff, and in addition to his physical injury, plaintiff's mind was affected. A man who makes a specialty of mental diseases or testifies as an expert in regard thereto is called an "alienist," a term common and well known amongst physicians. Suspecting that the doctor was not an intelligent and well-informed one, my first question was: Doctor, are you an alienist? He answered with vigor: I am an American citizen. Q. Well, are you an alienist? A. (again, emphatically) I am an American citizen. Q. I didn't ask you that; are you an alienist? A. I am an American citizen. Q. Well, are you an alienist? A. I am an American citizen. Q. Well, are you an alienist? A. I am an American citizen. Q. Is that all the answer you will make? A. Yes. Q. Do you answer that way because you think I am inquiring whether you are a citizen or an alien? A. I told you I am an American citizen. On further questioning he said: I heard the word "alien" but could not define it. What it means I could not say at present. Q. What do you think it means? A. I don't know.

One condition of the eye is known as "Argyle-Robertson pupil." When this doctor was asked if he knew what that is, he said: "I can give you fifty-five or a hundred names. Every specialist has his name attached to the reflexes and the eye trouble." When asked again what it is, he answered: "It is according to what book or dictionary you read. It is different in different books. They have all kinds of definitions." . . . There are a great many reflexes, as they are called, but to any intelligent physician who has made a slight study of them, they are not at all difficult to know.

In a certain case plaintiff's expert doctor testified as to certain reflexes. On cross-examination he was asked if he took certain reflexes, and said that he did, and certain others he said he did not take but recognized as being standard tests in that kind of a case. Amongst the latter was the "Cerebro-Piper-Heidsieck." It is needless to say that "Piper-Heidsieck" is the name of a brand of champagne and there is no such reflex as "Cerebro-Piper-Heidsieck."

224. RICHARD HARRIS. *Hints on Advocacy*. (Amer. ed. 1892. pp. 84, 97, 117.) Another class of witness deserving of notice is that of the *semi-professional*. He is in fact semi-everything, — half veracious and half liar; his word is positive and his respectability comparative.

I have in my mind a little, lean old man, with a high, narrow forehead

and a much underhanging lip, a mouth that twitches with self-importance, and an impatience of contradiction. He wears glasses that shut up, and waves them with an air of consequence when he answers a question, putting them on and taking them off with his hand in front of his face when he wishes to evade your question. This gentleman always seems to have a map or plan of something before him, for he calls himself a surveyor, although his principal business is that of an undertaker. He is a great authority on party walls, boundary fences, old drains, and the locality of disused cesspools. A case of dilapidation could no more get along without him than a German band could proceed harmoniously without its most prominent instrument, the trombone. In fact, but for this worthy gentleman there would probably have been no action at all, for he usually combines the greed of a pettifogging lawyer with the quarrelsome faculty of the parochial meddler.

Now this man is full of "purlines," "bressimers," "architraves," "buttresses," and other architectural expressions. With these and his eyeglasses he could prove any case against anybody, if you did not cross-examine him. He combines within himself all the qualities which make up a deceptive witness — truthful, false, dogmatic, opinionative, clever, cunning, and courteous. You could no more bully this man into telling a lie than you could persuade him to tell the truth. You can no more demolish his respectability than you can deprive him of his honest intentions.

How, then, will you cross-examine a man who has all the goodness of the canting hypocrite with all the pretensions of the scientific witness?

Tenacity of opinion is his weakness. He will sacrifice truth itself rather than give up his opinion. Drive him into that net and you have him a safe captive. . . . In all probability any one could do what Mr. Scraper is called upon to perform, namely, tell how many slates are off, how many windows broken, and how many doors require hinges. But in whatever circumstances this individual may appear, if you wish to attack his knowledge, cross-examine about *facts*, and you will soon learn whether he knows his business or not. If you yourself know nothing of what you are cross-examining to, he will beat you unmercifully at every point; if you do know something you will plumb the depth of his scientific ignorance very soon. . . . So he stands with his glasses in one hand and his compasses in the other, and the map before him, defining the boundary of some institution whose wall is supposed to have encroached upon the plaintiff's premises. He will tell you how it has "canted over" out of the upright, as he himself very often does, and how the fault was with the foundations, which could never have been good, and how that recently there must have been a subsidence and another "canting over," and so on. . . .

As this old gentleman peeps over the ledge of the witness box, and maintains his opinion to the death that the foundation of the wall was not good and sufficient, you will elicit that he cares nothing for all the opinions of all the scientific men of the day; it does not matter to him that the wall has stood for a hundred years at least in exactly the same state as now. He will maintain that the superstructure (be sure and feed him with long words) must have been sound, or it would not have stood so long. And although he agrees with others that there is not a crack to be found in the wall, he will maintain his opinion with greater obstinacy than ever, *because it is necessary*, the wall having lately, according to his theory, encroached or

canted over several inches; and when he is forced to admit that *it bulges into a circle without a crack*, he would rather believe in the capacity of the bricks to stretch or bend than in the possibility of his own evidence inclining to do either for the sake of his client. So he proves either that the wall was originally built as it is, or that every brick has stretched and bent in a miraculous manner. Such proof was given not long ago by the semi-professional witness. . . .

The Medical Witness. Medical witnesses should be carefully watched in these respects. They are witnesses of *theory*, and are most tenacious of their opinions. They take opposite sides, and arrive at opposite and adverse conclusions, not exactly from the same premises, but from a different conception of the premises, or from regarding them from a different standpoint. It will be acknowledged that it makes all the difference in the world whether these witnesses form an opinion from the facts, or whether they start with a theory and then endeavor to make the facts square with it.

A great deal of what is termed medical evidence is not medical evidence in any sense of the term, except that it is given by a medical practitioner: and in the same sense as a woman's might be said to be "female evidence." Much that a scientific witness gives might be given as well by an ordinary person and very often a great deal better. "I discovered considerable ecchymosis under the left orbit, caused by extravasation of blood beneath the cuticle," said a young house surgeon in a case of assault. Baron BRAMWELL: "I suppose you mean the man had a black eye?" Scientific Witness: "Precisely, my lord." Baron BRAMWELL: "Perhaps if you said so in plain English, those gentleman would better understand you?" "Precisely, my lord," answered the learned surgeon, evidently delighted that the judge understood his meaning, and accepting the rebuke as a compliment.

If you look at a plain fact through the lens of scientific language, its shape usually becomes distorted. Giving a man a "black eye" may be considered a trifling offense, and a jury might acquit; but impress them with the idea that the prisoner caused "extravasation of blood under the left orbit," and he is regarded as a monster of cruelty to whom no mercy can be shown.

An eminent Queen's counsel told me, apropos of the quickness with which medical practitioners sometimes arrive at a conclusion, of a case that occurred some years ago. A woman who had cohabited with a tradesman in a country village suddenly disappeared. Her paramour gave out that she had gone to America. Some years after a skeleton was found in the garden of the house where she had lived. On examination by a medical man *he at once pronounced it to be that of the missing woman*. He formed this opinion from the circumstance that one of the teeth was gone, and that he had extracted the corresponding one from the woman some years before. Upon this the prosecution was instituted, and the man was committed for trial to the assizes. Fortunately, there was time before the trial came on for a further investigation of the garden where the skeleton was found, and on digging near the spot another skeleton was discovered, and then another, and another; then several more. This threw some doubt upon the identification of the bones in question, and on further inquiries being made it turned out that the garden had once been a gipsy burial ground. It need scarcely be added that the prosecution, which had been vigorously taken up by the government, was at once vigorously abandoned.

The Surveyor (Mr. Unilateral). As diversities of climes and soils produce diversities of trees, so the various kinds of contentious legal business give rise to a vast variety of witnesses.

Here is a specimen you shall find on no other soil than a Railway Company's, or some other Public Company's or Board's, taken under the powers of their act. Let us study the characteristics of that important and respectable class of witnesses known as SURVEYORS. They are of two great divisions, the surveyors, and the surveyors who *survey them*; or they may be called the surveyors and their contradictors. One swears a house is worth fifteen hundred pounds, another that it is only worth one hundred and fifty; both conscientious men, swearing to the best of their ability; and very able swearing it is! Both conscientious, and nearly standing on the same spot from whence they take their survey, but standing as they do back to back, by no means looking at things from the same point of view.

Now, in estimating the value of Land, the value of a House, a Lease, a Business, or an Interest of any other kind, there is really no difficulty whatever in ascertaining the market value. If two men were to appoint to meet in London at a given time and place, they would meet: but if the same men started off to find one another without having mentioned time and place, there would be many difficulties in their way, many inquiries would be necessary, and in all probability some third person would have to bring them together. It is so in the life of surveyors; both sides start off in *opposite directions*, and it is a good while before they meet. Take a case where on the one side the offer was £250 and the claim on the other was £3950! Is it to be supposed that both parties were not well aware that these figures meant nothing, *except*, perhaps, that juries will sometimes add the two sums together and divide by two?

In this case, and in every other of a like character, you will find the conscientious witnesses ranging themselves on either side in preparation for the tussle, every one of them primed with reasons, prompt with measurements, and precise in figures. The most skillful adjuster of the minutest of apothecary's scales could not be more delicate in touch or exact in calculation than these conflicting gentlemen.

There is a mode in which calculations are sometimes made in these cases, which may be told in the words of a hack surveyor who was often employed in compensation cases of a minor kind. He was asked, privately, how he so readily made his calculations, seeing that he came into court without any report. "Oh," said he, "it's habit; after you have been at it some time it becomes a kind of second nature. It used to take me a long time to go over the premises and make all sorts of calculations; but now I let other people do that — *the other side*; I listen to their evidence, take their figures, which I think fair to *them*, and then *cut them down by three-fourths*, which I think fair to *us*."

I once heard a brickmaker, called to give evidence for a railway company, which had taken some brickfields, reduced to this by cross-examination: "I have come to speak to the loss sustained by the Plaintiff through having his brickmaking business taken from him; I come from — shire: I make bricks on a large scale there; the defendant Railway Company is a *great customer of mine*. . . . Plaintiff's bricks are the worst I ever saw. They are

not worth anything. There is no profit this year on good bricks: has not been any profit for the last three years; there will be a loss this year. If Plaintiff swears he made a profit this year, and proves by his books that he is making a profit, I would not believe him; I would not believe him or his books, or anything that is his. I do not believe him when he swears he has spent money in preparing his land for making bricks. I believe that taking the land and business of the Plaintiff away from him by the company *is a good thing for him*, and will put money into his pocket without any compensation at all." This brickmaking witness has been called over and over again by a railway company to cut down claims, although no tribunal with any self-respect could attach importance to his evidence.

The Expert in Handwriting (Mr. Grapho). An intelligent, keen-eyed man steps lightly into the box in a case of murder. There is a confident air about him which impresses you. He is scientific as well as philosophic. Can he, I wonder, read not only "sermons in stones," but murder in love letters, and divorce in everything? . . . "How long have I been studying handwriting, sir?" "Well," he thinks, "that is a most commonplace question, truly *the most commonplace* — I have answered it a thousand times." Nevertheless, he places his white hands on the book before him, one over the other, and, looking up to the ceiling, as though making the calculation for the first time, and the question were an abstruse one — "Five-and-thirty years, sir." Now he takes out his folding glasses, with the delicate touch of a man accustomed to deal with delicate matters only. He holds them between the tip of his thumb and the side of his middle finger, the forefinger being gracefully posed on the gold rim. These glasses, destined to play so important a part in his evidence, he shakes scornfully, scientifically, and almost mathematically at the young counsel. . . .

Yes, the charge is murder; and the proof handwriting. Here is the witness to prove that the prisoner is guilty. "No, no," says the expert to himself, "not I. You have given me specimens of handwriting to examine; I say they are in the handwriting of the prisoner. *You* say if he wrote them he is guilty, and so will say the jury." Beautiful distinction, but did you happen to know the probable effect of the examination before you made it, *Mr. Grapho?* . . . But what you still want to know is, *what influence was at work in his mind which may have led him to a particular conclusion* with reference to the loop of a G or the twist of a Y. How came he to think it was like the prisoner's? Did he know that a murder had been committed? "Not in reference to this case!"

Mark that answer and *repeat the question*. He *wasn't* told when the specimens were sent, of course: and he *wasn't* told that the specimens were the prisoner's, or that he was to compare the fatal paper with the specimens. And I will tell you why he *wasn't* told, as it is a point to be remembered on the very threshold of your cross-examination. *It is so easy to find resemblances in almost all handwritings of the same class of persons; of boys or girls in the same school; and even persons in the same employ, that you might well believe two or more persons' writing were written by the same hand. Boys copy their masters, girls their mistresses; junior clerks copy older clerks. And remember further, it is so-called peculiarities or eccentricities that will be sure to be copied.*

Mr. Grapho was not told; but if he had read of the murder he would know

two facts: one that a document was left by the murderer stating that some one else had committed it; the other that a shopman was the last person seen with the deceased; *and* he would know a third fact when the books in which were entries made *by the shopman* were given into his hands to compare with the *fatal paper*. So you see the expert would have no vague or indefinite idea of what he was about. That is the first point to establish — do it how you may: *not how long he has been studying his profession*.

The next point to make is *as to the mode* of examination by this experienced expert. And here you will be amazed at the elaboration of the system for finding out nothing, which has been invented by science. He “first of all,” he says — takes the “*undoubted handwriting of the prisoner’s*,” this is one of his scientific phrases — “the undoubted handwriting of the prisoner’s;” and he “*examines for peculiarities*” — another.

But this is begging the question at once, *are they peculiarities*? He calls them so and stamps them with guilt. He next *finds* “on line thirteen of page fourteen, my lord,” nodding at my lord with nervous respect: “line thirteen of page fourteen” — says the judge, counting vigorously — “yes, I see; I’ve got it.” “Your lordship will find” — here’s a sly look at counsel, as much as to say, now listen to this revelation — “the down stroke of the F in fool is at a very *remarkable angle*, an angle of fifty-four and a half, my lord. Now, this angle occurs only about once in fifty-four millions of handwritings. Then I find in looking at the disputed handwriting at page four of the daybook, line twenty-two the F in the word “foot” has precisely the same angle and the peculiar *crook*, if I may so call it” — pauses as though this powerful expression must elicit silent applause. You mark this scientific discovery and cross-examine upon it, because it is totally inapplicable and no more a “crook” or a peculiarity than you will find in the handwriting of nine persons of the prisoner’s class out of ten.

“There is next, my lord, at page five, line seventeen, an O which is made like a *semibreve*.”

“A what?” says the judge.

“Semibreve, my lord. Perhaps I shall be clearer if I say it is an O *recumbent*. Then, my lord, there’s a J of a very remarkable and pronounced kind; your lordship will observe that the loop or convolution is *elongated*. This is at page six, line two, my lord; and it occurs twice in the fatal document, and once in the undoubted handwriting.

“The next letter I come to, my lord, is a W, which is found on page seven, line eight of the daybook, and occurs three times in the fatal document. Your lordship will observe that it is *serrated*, or (turning to the jury) *like a saw, gentlemen*. Serrated, my lord. And that same serrated appearance is observable in the M’s of the undoubted handwriting of the prisoner, my lord.”

And thus, through the alphabet, Bias has hooks, crooks, crosses, convolutions, semibreves, humpbacks, dislocations, and deformities of all sorts, and letters that look like murderers, burglars, and other disreputable persons, with the common hangman amongst them. But bring common sense to bear upon it in cross-examination, so shall you reduce these exaggerated peculiarities to the natural tendency of persons *to copy one another*. Once show that the prisoner’s life depends upon the down stroke of a “D” or the up-stroke of a “C,” the crossing of a “T,” or the dot of an “I,” and he will live.

There are such things as forgeries, and forgers imitate peculiarities. Hand-writing is seldom to be believed, even when it speaks the truth.

There are other witnesses, doubtless, slightly varying in their peculiarities of disposition and temper, but these the reader will easily note from his own observation, and I doubt not will find, on examination, that most of them may be included within the classes enumerated.

But of whatever types they may be, and however much they may differ from one another, there is one weakness which runs through them all, and that is *vanity*. No human being is exempt from its influence; and the only difference between one man and another in this respect is as to the object of his vanity and the effect of it upon the other attributes of his nature. One man's vanity may impel him to aspire to a coronet, another's only to wear his hat a little on one side and to put his thumbs in the armholes of his waistcoat.

228. **THROCKMORTON v. HOLT.** [Printed *post*, as No. 390.]

229. **FRANK S. RICE.** *The Medical Expert as a Witness.* (Green Bag. 1898. Vol. X, 464.) Of all the cant that's canted in this canting world, expert medical cant is the most pernicious; and of all species of evidence offered in a court of justice, none is so thatched with suspicion or further removed from every suggestion of usefulness as is the evidence of a medical expert. Indeed these glib-tongued pundits have so effectually discountenanced themselves in juridical estimation that (to adopt the vigorous language of Lord Chancellor CAMPBELL in the Tracy Peerage Case, 10 Clark & F. 154): "They come with such a bias on their minds to support the cause in which they are embarked, that hardly any weight should be given to their evidence." . . . Mr. Wharton pilloried the whole guild in one of his most admired passages, which is still quoted with approbation: "Few specialties are so small as not to be torn by factions; and often, the smaller the specialty, the bitterer and more inflaming and distorting are the animosities by which these factions are possessed. Peculiarly is this the case in matters psychological, in which *there is no hypothesis so monstrous that an expert cannot be found to swear to it on the stand, and to defend it with vehemence when off the stand.* 'Nihil tam absurde dici potest, quod non dictatur ab aliquo philosophorum.' In the second place, the retaining of experts by a fee proportioned to the importance of their testimony, is now, in cases in which they are required, as customary as in the retaining of lawyers. No court would take as authority the sworn statement of law given by counsel retained on a particular side, for the reason that the most high-minded men are so swayed by an employment of this kind, as to lose the power of impartial judgment; and so intense is their conviction that there is no civilized community in which the reception of a present from a suitor does not only disqualify but disgrace a judge. Hence it is that, apart from the partisan

temper more or less common to experts, their utterances, now that they have as a class become the retained agents of parties, have lost all judicial authority, and are entitled only to the weight which a sound and cautious criticism would award to the testimony itself. In adjusting this criticism, a large allowance must be made for the bias necessarily belonging to men retained to advocate a cause, who speak not as to fact, but as to opinion; and who are selected on all moot questions, either from the prior advocacy of, or from their readiness to adopt, the opinion to be proved." (Wharton, "Criminal Evidence," § 420). . . .

Let us consider briefly the usual environment of the average physician before he becomes deified as an expert. From the time he leaves college, his life is spent among those who are hopelessly ignorant of *materia medica* or of clinical procedure. Imperceptibly there fastens upon him, by insidious and subterraneous approaches, an exalted opinion of his own accomplishments, and a corresponding contempt for antagonistic views. He is a monomaniac on the subject of his own importance. The lawyer is emancipated in great measure from the effects of such an existence, as his postulates are constantly the subject of criticism and demur, his position and theories are controverted and denied, and by constant contact and attrition with other superior minds, he is admonished to place salutary limitations upon his own conceits, while he absorbs a wholesome respect for the opinion of his legal fraters. Not so with the physician. At rare intervals, usually at the instigation of an admirer, he is called into consultation on a critical case. There is no occasion in such an event for controversy. His presence would not be requested if there were the least danger of such a calamity. Professional etiquette requires him to sustain his colleague or copractitioner, and they meet in that spirit of camaraderie which makes disagreement impossible. . . . The consequence of this training, persisted in for a series of years without the least deviation, enables the serene Olympian to mount the witness stand with the perfect composure and touch-me-not-ish-ness that belongs to the elect Brahminical caste. He answers the interrogatories with a chilling and glacial hauteur that shows the impervious nature of his conceit and the braying folly of any attempt to remove it. Long years of hectoring over hypochondriacs, valetudinarians, and hospital nurses has imparted an aspect of infallibility to his "ipse dixit," that nothing but the most dropsical temerity would dispute. He is looked upon as the Gog and Magog of Hunnish desolation to any theorizing that contradicts that sacramental thing known as his "opinion." . . . If there are contending factions in his own specialty, our M.D. relapses into dogmatism, and we are apt to find a touch of irony now and then — when he refers to the "advanced scholarship of the profession," and the "demonstrations regarding the development of the microbe." Clotted nonsense of this type can never become the adjunct of intelligent exposition — it only leads to bewilder and dazzles to betray.

Thus far we have lingered in our exposé of the medical expert upon mere deficiencies in good taste and those debonair attitudes of mind that make man an agreeable companion — we have regarded nothing that menaces his integrity, or suggests more than ordinary caution in accepting his statements. Unfortunately, however, there is a distinctively knavish element in his testimony that assumes many disguises if plausibly presented and

adroitly maintained. . . . It is indisputable that the principal abuse ingrafted upon modern expert evidence arises directly from the enormous fees, so called, that are paid to these pampered witnesses. The ordinary subpoena is sufficient to bring into any court the multimillionaires of the country — the very Titans of our industrial enterprises, the men, in short, that have made America. But to secure the invaluable testimony of the medical “expert” resort is had to methods perilously close to bribery. Where is the distinction, in effect, between paying a witness an exorbitant sum of money for his testimony, under the flimsy guise of a “fee,” or openly bribing him to say the same thing? Is it not morally certain that all his sympathies, prejudices, and predilections are enlisted upon the side that solicits his patronage and pays royally for it? And is he not in a more compromised position, if possible, when that fee or payment is contingent upon the success of the party calling him? (See *Pollak v. Gregory*, 9 Bosw., N. Y., 116). If not bribery, it has everything bad about it except bribery. . . .

The foregoing views have been in part suggested by the monumental exhibit of expert imbecility known as the Luetgert case [*post*, No. 387]. Of all the ghastly travesties upon common justice and common sense that have disgraced these closing years of the nineteenth century, that trial will probably stand as “*primus inter pares*.” The demoniacal efforts of the experts to contradict each other and to prove some rival school of anatomy to be the mere nursing mother of a hoard of fakirs resulted, as might have been expected, in the total eclipse of the last faint struggling ray of intelligence that the jury may be supposed to have possessed. . . . Luetgert is breaking down under a sentence of life imprisonment rendered on the theory that his wife’s bones were found in a sausage vat, and yet some of the most eminent osteologists of the age vehemently insist that the bones in question belonged to a hog. . . .

230. ALBERT S. OSBORN. *Expert Testimony from the Standpoint of the Witness*. (Albany Law Journal. 1905. Vol. LXVII, No. 11.) It is quite natural that competent expert witnesses who are able to testify to the truth, and only the truth, should feel that the great reform needed is the adoption or the perfecting of procedure that will make it easier for honest and competent men to assist in showing the facts in a court of law and more difficult and embarrassing for liars and incompetents to assist in concealing and distorting the truth. Some reformers attempt to bring about improvement, not by improving the method, but by wholesale denunciation of both classes of witnesses, good and bad. Nothing but harm comes from such a practice. . . .

No phase of expert testimony has been more misunderstood, misrepresented, and abused than testimony regarding handwriting and the numerous questions arising in relation to disputed documents. . . . The usual practice in the preparation of a case involving a questioned writing is easily described. In a large majority of such inquiries the facts are clearly in favor of one of the parties. The attorney on the right side seeks out and presents his case to those really expert specialists who are known to be competent and honest, and, as his contention is in harmony with the facts, such witnesses are secured. Does the opposing party abandon the case when he cannot get

the best witnesses? Not by any means, but promptly proceeds to get what he can, which may be the worst. Those witnesses are industriously sought out whose opinions are favorable, and often they are those who through incompetency may easily be mistaken, or those witnesses are deliberately sought for whose services are known to be available on any case, and then both sides prepare for trial, one side endeavoring to show the truth, the other attempting to distort or hide the fact and thus defeat the ends of justice. The case is taken into court and presented to a jury, and if the expert testimony, given it may be by an equal number of witnesses, is at the end summed up by "counting the witnesses," as unfortunately is sometimes done, such procedure certainly does not tend to promote the ends of justice.

The testimony of a competent handwriting expert witness in a good case — which is simply an argument under oath; that is, an opinion with reasons — cannot be nullified and made ineffective by liars and incompetents if the matter is considered and presented to a jury in the clear, judicial manner shown in the opinion quoted below. Such a sane, common-sense discussion of this important question should form a part of an important decision on this question by the highest court of every State. This opinion says: "Much has been said and written concerning the value of expert evidence, and there is a disposition to belittle the utility of evidence of this character. . . . It is urged that we find as many experts testifying upon one side as upon the other. That may be true, and it is also true that we will find as many lay witnesses upon each side in litigated cases giving different versions concerning a fact or circumstance. But this does not signify that the evidence of those witnesses must be disregarded because they disagree. Nor is it important specially which side has the greater number of expert or lay witnesses sworn in his behalf. It is the nature or character of the testimony given by the witness which is important. In the case of expert witnesses their opinions are valuable only in so far as they point out satisfactory reasons for the ultimate conclusion of the witness. If the witness simply testifies that he believes the signature genuine or not genuine, as the case may be, and gives no reason for reaching his conclusion, his opinion is valueless and the court will not consider it. If he *gives reasons for his opinion*, then it is the duty of the court to examine into and analyze those reasons and determine the correctness or incorrectness of the opinion and not simply consider the conclusion of the witness alone." (Matter of Burtis, 43 N. Y. Miscel. Reports.)

When a question of this character is considered and discussed in this sensible manner and thus presented to an intelligent jury, and the party in the right has prepared his case in the proper manner, justice will be done in a very large majority of cases, no matter how many mistaken or corrupt witnesses have sworn on the wrong side. As is said, "the nature or character of the testimony given" is the important thing. . . .

There is much discussion of the "disagreement" of expert witnesses that does not seem to consider that *one side is* in the right. What the competent witness who attempts to tell the truth objects to in criticisms of experts or expert testimony is generalizing that is made to apply to a specific case where it really does not apply. It is like generalizing on any question. The man who agrees with the much-criticized Roycroft sage when he says that lawyers have two objects in life, grand larceny and petty larceny, is one who

takes it for granted that a man steals when he has an opportunity ; and the man who says that there are no honest witnesses who are paid to investigate a question, prepare proper illustrations, and testify in court, is of the same pessimistic class. There still are honest lawyers and honest specialists who testify in court, and what they object to, lawyers as well as specialists, is that procedure, that prejudice, and that lack of information that does not attempt to discriminate, but puts all in one class. . . .

The prime requirement in any reform is that procedure that will assist in every way possible in separating the true from the false, the competent from the incompetent. It is impracticable to brand liars and incompetents, or keep them out of court rooms ; but it would be possible to protect competent men and recognize in an official way those witnesses who are worthy and qualified to be heard on a subject requiring expert testimony, those, in short, who really are experts. This is a reform that is practical, constitutional, and would undoubtedly be effective, and could be put into immediate use. The problem has been solved in England in this practical manner by the selection of certain men or a certain man of proved efficiency to act for the state in all such inquiries. This practice does not exclude other witnesses, and the "man who kept the cows" may still come forward and swear that black is white, and, therefore, this procedure would not take away the right under the Constitution that an accused man has of calling his own witnesses. Such an official designation of really expert witnesses would at once correct many of the faults and abuses of this phase of legal procedure and would still permit the fullest cross-examination on the question involved. No procedure should be adopted that directly or indirectly limits proper cross-examination. This official recognition would assist in classifying witnesses as to their competency, it would at least in a measure relieve witnesses of the charge of improper bias and partially protect them from insult, and it would enable lawyers in such investigations before trial, to get at once the best advice and assistance available.

231. WILLIAM L. FOSTER. *Expert Testimony*. (Harvard Law Review. 1897. XI, 169). . . It will be observed that the most frequent and most serious complaint concerning expert testimony is the *want of agreement* upon the same subject and in the same case, among equally learned men, rendering their testimony (it is said) uncertain, confusing, and bewildering to the extent that it is unreliable and of little value. And yet I doubt if an intelligent, thoughtful, and candid man can be found, who will not admit that, notwithstanding all its faults and imperfections, it would be impossible to get along without it. It is certainly true that there are and always will be differences of opinion among experts of the highest character, "rarely in regard to well-established facts, but often in regard to probable inferences from facts ; whilst entire agreement in matters of theory and speculation would be marvelous." But concerning this alleged misfortune, it seems hardly becoming for the *legal* profession to indulge in severe criticism, since there is no profession so strongly characterized by differences of opinion on every subject, — lawyers as well as judges constantly disagreeing, and the latter not unfrequently overruling one another's decisions, — unless it be the clerical profession, the members of which, it may have been observed, are not entirely unanimous in their interpretations of

the Holy Scriptures. Yes, it is a visible truth that doctors, as well as lawyers and ministers of the Gospel, do disagree. It would be marvelous and deplorable if they did not. If there were no disagreement, investigation and experiment would cease; and science, literature, and art would sink to a dead level of stupidity and laziness. If scholars and learned men had come to a condition of unanimous agreement a hundred years ago, we should have had none of the marvelous discoveries and inventions, — none of the magnificent victories and triumphs in medicine and surgery, — that have distinguished and illuminated the closing years of the nineteenth century.

It will be observed that the faults and imperfections of the present system and methods of procedure in the matter of scientific testimony are not magnified to my vision. For whatever is wrong and capable of redress, for so much of the evil of the present system as is not imaginary, what and where is the remedy? Without any progress toward a satisfactory result, search for it has been prosecuted for years and years.

(1) In Germany, and perhaps elsewhere on the European continent, the following method has been established. For certain matters and lines of business (I have not ascertained what these are) permanent experts are appointed by the State. They have no official title nor regular salary, and their payment barely compensates them for loss of time. But in most cases the expert is appointed by the particular judge sitting in the case. . . . There have been in this country many advocates of the German method. . . . Professor John Ordronaux is one of many who are in favor of having expert witnesses appointed by the court, and excluding all others. He thinks "the expert should be regarded as an '*amicus curiæ*,' whose opinion should be a conclusive judgment." That condition would seem to destroy his function as a witness, leaving him to *instruct* the judge as to what is the fact, and the judge to instruct the jury accordingly, — a theory and practice obnoxious in the extreme, and subversive of the rule that the jury alone shall determine all questions of fact. . . .

(2) Judge Washburn, while in favor of continuing the present method of summoning experts, thought the presiding judge should have power himself, if in his judgment the interests of justice would be promoted thereby, to summon experts of his own choice, who should review the whole testimony and evidence of the experts called by the litigants. The proposition strikes me favorably. . . .

(3) It has been proposed that "a certain number of scientific men should, in certain circumstances, sit upon juries and hear the evidence, as ordinary juries do at present." . . . *With reference to a jury or other tribunal composed wholly or in part of experts, one of the most eminent of English jurists, the late Sir James Fitzjames Stephen, discovered so many "difficulties of detail and practice" in the adoption of any such plan, that it seemed, in his judgment, to be most injurious. It was his opinion (in which I fully concur) that, "given uprightness, patience, and such intelligence as most educated members of society possess, a jury constituted as our juries are forms the very best tribunal which could be devised for the trial of complicated questions of fact, even if those questions involve delicate scientific considerations." . . . Ordinary men are quite capable of forming a trustworthy conclusion. I

say trustworthy; for that is all that can be expected or required. Comparatively few subjects of expert testimony are capable of absolute demonstration; and the judgment of a jury or an expert is ordinarily no more certain than that the conclusion, in a civil case, is *probably* correct, and, in a criminal case, that the accused is *probably* innocent, or that his guilt is established beyond a reasonable doubt.

Finally, my belief is, that the supposed evils of the present system are much exaggerated, and to a great extent imaginary; that they are not to be cured by any remedy that has been or seems likely to be devised, and that, on the whole, it is best to "let well enough alone."

TITLE II: THE ELEMENTS OF THE TESTIMONIAL PROCESS ITSELF, AS AFFECTING THE TRUST- WORTHINESS OF TESTIMONY

SUBTITLE A: PERCEPTION (OBSERVATION, KNOWLEDGE)

234. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913).¹

1. *Perception, Opportunity to Perceive, and Knowledge; their Difference and their Practical Sameness*. It is obviously impossible to speak with accuracy of a witness's "knowledge" as that which the principles of testimony require. If the law received as absolute knowledge what he had to offer, then only one witness would be needed on any one matter; for the fact asserted would be demonstrated. When a thing is *known* to be, it *is*; and that would be the end of inquiry. A witness cannot be assumed beforehand, by the law, to know things; the most it can assume is that he thinks he knows. The law assumes that the matter is in truth of some particular complexion, but also realizes that to determine what its real complexion is the tribunal may have to listen to various persons; the statements of some of these it will reject, and of others it will accept. But from the persons to whom the tribunal will listen the law will attempt to require some qualification which will make them worth listening to. It will not presume to determine beforehand which witness is correct, *i.e.* which one really *knows*, but it will ask that each one offered shall be one *prima facie* likely to know, — in short, shall have had *an opportunity of perceiving or observing* what was or what happened and shall have *directed his attention* or observation to the matter. This is as far as the law can go.

But the law can at least go that far. Amidst the multitude of persons who have formed impressions and think that they "know" something about the subject in hand, practical experience shows that many or most have formed their beliefs without any basis of perception safe enough to be worth considering in a court of justice. A belief-basis adequate enough for the casual affairs of life may be too slender for settling the facts of rights and wrongs in court. For instance, a person may have a belief that the local post office opens at 7 A.M. and closes at 6 P.M.; but on careful self-scrutiny before acting on that belief, the person may acknowledge that he has no tangible basis at all for it. Hence, a Court may well insist on requiring some minimum of adequate basis for belief; or at least may insist on ventilating thoroughly whatever basis there is, so that the weight of it may be gauged.

¹ [Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, §§ 650-654.)]

We are here concerned only with the latter process, *i.e.* with forcing into the open the data of witness's *opportunities* for having perceived with his own senses the event or act in question, and the extent of his *actual direction of attention* to it. A witness may have stated glibly that he "knows" something about it, and that he has been so placed as to have an opportunity of perceiving, and may have smoothly stated what he saw or heard; and yet, on closer inquiry, facts may be disclosed which show that he could not well have seen or heard, but acquired his impressions in some less adequate way. Such data will assist much in valuing his supposed perceptions.

This process of evoking into the open the witness's basis of perception is one of the commonest in trials. It puts in sharp contrast an *Impression*, *guess*, or *notion*, lacking in a basis of sense perception, with a *Knowledge*, or perception based on direct attention of the senses. The psychologists begin with the latter stage, assuming without question that it exists, and proceeding to point out the elements of fallibility that still inhere in it. But in the practical conduct of trials, its existence cannot be assumed; for so many persons lacking it thrust themselves (or are thrust) forward as witnesses that a first business of the courts must be, if not to eliminate them, at least to ascertain their actual qualifications, so as to value their testimony accordingly.

Parnell Commission's Proceedings (1888. 36th day, Times' Rep., pt. 10, p. 18). [The Irish Land League and its leaders being charged with complicity in certain crimes; particularly in the Phoenix Park assassination of 1882, certain of the known criminals testified that their body, the Invincibles, had received assistance money from the League; it had turned out, on cross-examining one of them, that his testimony to the receipt of this money from the League officers was not based on his own knowledge at all, but merely on what he had heard from others; another of these persons was now asked on direct examination as follows:]

Sir H. James: "Tell me of your own knowledge whether you know of his receiving any money from the Land League."

Sir C. Russell: "My Lords, I would ask my learned friend to be particular as to that question 'of his own knowledge' after the experience we had of Delaney's evidence. 'Did he see any one pay him?' is the proper form of question."

Sir H. James: "I think not."

Sir C. Russell: "With great deference, my Lords, it is. We had a deliberate statement the other day in answer to a similar question put to a witness, 'Did you know this?' and 'Did you know that?' and, afterwards in cross-examination, it turned out that he did not know it of his own knowledge, but it was what had been told him. I want to guard against a repetition of that. The proper form of question as I submit is, 'Did he see any money paid?'"

Sir H. James (to the witness): "You understand what I mean—do you know this of your own knowledge?"

Sir C. Russell: "I am objecting to the form of the question."

President Hannen: "It is a very usual form of question."

Sir C. Russell: "I respectfully say, in view of the reasons I have given, what the proper question is, 'Did he see any money paid?'"

President Hannen: "I shall not interfere with the discretion of counsel in asking a question in a manner which is quite usual."

Sir C. Russell: "I have pointed out the danger—the great danger—of putting the question in the form in which my learned friend is putting it."

President Hannen: "Precisely so; and you have also shown where the safeguard lies, namely, in cross-examination."

2. *Distinction between Experience and Knowledge.* Observation or Perception of the matters to be testified to is, then, an essential conception in the qualifications of every witness without exception. By Observation is meant that direction of attention which is the source of impressions. The distinction between Experience and Observation is that the former concerns the mental power or capacity to acquire knowledge on the subject of testimony, while the latter concerns the actual exercise of the faculties upon the subject of testimony.

It is true that the distinction between Experience and Observation is sometimes lost sight of in the practical tests applicable to certain subjects of testimony. For example, when a Court adopts the rule of thumb that farmers in the vicinity of a certain piece of land may testify to its value, it is ruling upon both these subjects; it is ruling that farmers are persons of sufficient experiential qualifications, and it is also ruling that persons in the vicinity have sufficient observation or knowledge of the general class of values in question and of the piece of land in question. Again, when a Court rules that a bank cashier who has handled the kind of notes alleged to be counterfeit may testify to the genuineness of the one in question, it is ruling that bank cashiers are experientially qualified to form an opinion on the matter, and it is also ruling that the handling of the notes sufficiently insures observation or knowledge of the general type of note in question. In these instances, as well as in others, the rule of thumb does not distinguish the two principles. But the two elements must always exist, however obscured.

3. *Knowledge may rest upon a Hypothetical Basis.* The direction of attention which constitutes the source of the knowledge will usually be made upon matters as they present themselves to the senses out of court. But the observation may also be directed to the same matter hypothetically placed before the witness in court. Thus, a physician may examine a patient at his home and observe certain symptoms, whence he reaches the conclusion that a fever exists; but the same symptoms may be stated to him by counsel in court, and he may then reach the same conclusion, and it will be receivable, except that it will rest upon the hypothesis that the symptoms stated to him actually existed. Here the direction of attention to the symptoms is that observation which the law requires before receiving his conclusion as to the nature of the disease; but in the one case the alleged symptoms are learned by his own senses and rest on his own testimonial credit, while in the other case they rest on the hypothesis that other persons will testify them to be true.

4. *Knowledge often a Double Element, including (1) a Class of Things, and (2) the Thing to be Classed.* In certain subjects the observation must be of a double sort. For example, a witness to the value of a horse should be acquainted with the value standards for different classes of horses, and must also be acquainted with the particular horse to be valued. A witness to the genuineness of handwriting should be acquainted with the type or standard of the handwriting of the alleged writer, and must also see the disputed writing which he is to say does or does not belong to that type. A witness to the identity of a person, a voice, or anything else, ought to be familiar with the person or voice or other thing as to which the identity is asserted, and ought also to see or hear or otherwise perceive the thing to be identified

with it. In short, wherever the subject of the testimony consists in classifying or identifying or testing or authenticating, the witness's observation necessarily involves two elements, (1) an observation of the class, type, or standard, and (2) an observation of the thing to be classified or identified. Both elements must be supplied in his testimony.

It may be noted that here it is not uncommon to supply the second element by hypothetical presentation. Thus, in valuing the cost of a house's construction, the witness may have actual observation of only the value standards of different sorts of houses, and then the features of the particular house to be valued may be placed before him by hypothetical description. So a witness to the identity of a murdered person with one J. S. may have had actual observation of J. S. but not of the body of the murdered man, and the latter element may be supplied by showing him a photograph assumed to be that of the deceased, and then verifying the photograph as that of the deceased.

235. HANS GROSS. *Criminal Psychology*. (transl. Kallen. 1911. § 35, p. 187.) *I. Sense Perceptions*. Our conclusions depend upon perceptions made by ourselves and others. And if the perceptions are good, our judgments *may* be good; if they are bad, our judgments *must* be bad. Hence, to study the forms of sense perception is to study the fundamental conditions of the administration of law, and the greater the attention thereto, the more certain is the administration.

1. *The Senses*. (a) *General Considerations*. The criminalist studies the physiological psychology of the senses and their functions, in order to ascertain their nature, their influence upon images and concepts, their trustworthiness, their reliability and its conditions, and the relation of perception to the object. The question applies equally to the judge, the jury, the witness, and the accused. Once the essence of the function and relation of sense perception is understood, its application in individual cases becomes easy.

There has always, of course, been a quarrel as to the *objectivity* and *reliability of sense perception*. That the senses do not lie, "not because they are always correct, but because they do not judge," is a frequently quoted sentence of Kant's. . . . Descartes, Locke, and Leibnitz have suggested that no image may be called, as mere change of feeling, true or false. Sensationalism in the work of Gassendi, Condillac, and Helvetius undertook for this reason the defense of the senses against the reproach of deceit, and as a rule did it by invoking the infallibility of the sense of touch against the reproach of the contradictions in the other senses.

That these various theories can be adjusted is doubtful, even if, from a more conservative point of view, the subject may be treated quantitatively. The modern quantification of psychology was begun by Herbart, who developed a mathematical system of psychology by introducing certain completely unempirical postulates concerning the nature of representation and by applying certain simple premises in all deductions concerning numerical extent. Then came Fechner, who assumed the summation of stimuli. And finally these views were determined and fixed by the much-discussed Weber's Law, according to which the intensity of the stimulus must increase in the proportion that the intensity of the sensation is to increase;

i.e. if a stimulus of 20 units requires the addition of 3 before it can be perceived, a stimulus of 60 units would require the addition of 9. This law, which is of immense importance to criminalists who are discussing the sense perceptions of witnesses, has been thoroughly and conclusively dealt with by A. Meinong.

Modern psychology takes qualities perceived externally to be in themselves subjective but capable of receiving objectivity through our relation to the outer world. . . . The qualitative character of our sensory content produced by external stimuli depends primarily on the organization of our senses. This is the fundamental law of perception, of modern psychology, variously expressed, but axiomatic in all physiological psychology. . . . We see things in the external world through the medium of light which they direct upon our eyes. The light strikes the retina, and causes a sensation. The sensation brought to the brain by means of the optic nerve becomes the condition of the representation in consciousness of certain objects distributed in space. . . . We make use of the sensation which the light stimulates in the mechanism of the optic nerve to construct representations concerning the existence, form, and condition of external objects. Hence we call images perceptions of sight. . . . *Our sensations are effects caused in our organs, externally,* and the manifestation of such an effect depends essentially upon the nature of the apparatus which has been stimulated.

There are certain really known *inferences*, e.g. those made by the astronomer from the perspective pictures of the stars to their positions in space. These inferences are founded upon well-studied knowledge of the principles of optics. Such knowledge of optics is lacking in the ordinary function of seeing; nevertheless it is permissible to conceive the psychical function of ordinary perception as unconscious inferences, inasmuch as this name will completely distinguish them from the commonly so-called conscious inferences. The last-named condition is of especial importance to us. We need investigation to determine the laws of the influence of optical and acoustical knowledge upon perception. That these laws are influential may be verified easily. . . . If we were unaware that light is otherwise refracted in water than in air, we could say that a stick in the water has been bent obtusely, but inasmuch as everybody knows this fact of the relation of light to water, he will declare that the stick appears bent but really is straight.

From these simplest of sense perceptions to the most complicated, known only to half a dozen foremost physicists, there is an infinite series of laws controlling each stage of perception, and for each stage there is a group of men who know just so much and no more. We have, therefore, to assume that their perceptions will vary with the number and manner of their accomplishments, and we may almost convince ourselves that each witness who has to give evidence concerning his sense perception should literally undergo examination to make clear his scholarly status and thereby the value of his testimony. Of course, in practice this is not required. First of all, we judge approximately a man's nature and nurture and according to the impression he makes upon us, thence, his intellectual status. This causes great mistakes. But, on the other hand, the testimony is concerned almost always with one or several physical events, so that a simple relational interrogation will establish certainly whether the witness

knows and attends to the physical law in question or not. But anyway, too little is done to determine the means a man uses to reach a certain perception. If instantaneous contradictions appear, there is little damage, for in the absence of anything certain, further inferences are fortunately made in rare cases only. But when the observation is that of one person alone, or even when more testify but have accidentally the same amount of knowledge and hence have made the same mistake, and no contradiction appears, we suppose ourselves to possess the precise truth, confirmed by several witnesses, and we argue merrily on the basis of it. In the meantime we quite forget that contradictions are our salvation from the trusting acceptance of untruth — and that the absence of contradiction means, as a rule, the absence of a starting point for further examination. For this reason and others modern psychology requires us to be cautious.

Among the others is the circumstance that *perceptions are rarely pure*. Their purity consists in containing nothing else than perception; they are mixed when they are connected with imaginations, judgments, efforts, and volitions. How rarely a perception is pure I have already tried to show; judgments almost always accompany it. I repeat, too, that owing to this circumstance and our ignorance of it, countless testimonies are interpreted altogether falsely. . . .

The *individuality* of the particular person makes the perception in a still greater degree individual, and makes it almost the creature of him who perceives. . . . The variety is still further increased by means of the comprehensive activity which Fischer presupposes. "Visual perception has a comprehensive or compounding activity. We never see any absolute simple and hence do not perceive the elements of things. We see merely a spatial continuum, and that is possible only through comprehensive activity — especially in the case of movement in which the object of movement and the environment must both be perceived." But each individual method of "comprehension" is different. And it is uncertain whether this is purely physical, whether only the memory assists (so that the attention is biased by what has been last perceived), whether imagination is at work or an especial psychical activity must be presupposed in compounding the larger elements. The fact is that men may perceive an enormous variety of things with a single glance. And generally the perceptive power will vary with the skill of the individual. The narrowest, smallest, most particularizing glance is that of the most foolish; and the broadest, most comprehensive, and comparing glance, that of the most wise. This is particularly noticeable when the time of observation is short. The one has perceived little and generally the least important; the other has in the same time seen everything from top to bottom and has distinguished between the important and the unimportant, has observed the former rather longer than the latter, and is able to give a better description of what he has seen. And then, when two so different descriptions come before us, we wonder at them and say that one of them is untrue. . . . In the variety of perception lies the power of presentation (in our sense of the term). . . .

In this connection there are several more conditions pertaining to general sense perception. First of all there is that so-called *vicariousness of the senses* which substitutes one sense for another, in representation. The

actual substitution of one sense by another as that of touch and sight, does not belong to the present discussion. The substitution of sound and sight is only apparent. *E.g.* when I have several times heard the half-noticed voice of some person without seeing him, I will imagine a definite face and appearance which *are* pure imagination. So, again, if I hear cries for help near some stream, I see more or less clearly the form of a drowning person, etc. It is quite different in touching and seeing; if I touch a ball, a die, a cat, a cloth, etc., with my eyes closed, then I may so clearly see the color of the object before me that I might be really seeing it. But in this case there is a real substitution of greater or lesser degree. . . .

The vicariousnesses of visual sensations are the most numerous and the most important. Anybody who has been pushed or beaten, and has felt the blows, will, if other circumstances permit and the impulse is strong enough, be convinced that he has seen his assaulter and the manner of the assault. Sometimes people who are shot at will claim to have seen the flight of the ball. And so again they will have seen in a dark night a comparatively distant wagon, although they have only heard the noise it made and felt the vibration. It is fortunate that, as a rule, such people try to be just in answering to questions which concern this substitution of one sense perception for another. And such questions ought to be urgently put. . . .

Still more significant is that characteristic phenomenon, to us of considerable importance, which might be called *retrospective illumination of perception*. It consists in the appearance of a sense perception under conditions of some noticeable interruption, when the stimulus does not, as a rule, give rise to that perception. . . . In a case in court, there was a shooting in some house and an old peasant woman, who was busy sewing in the room, asserted that she had just before the shooting heard a *few* steps in the direction from which the shot must have come. Nobody would agree that there was any reason for supposing that the person in question should have made his final steps more noisily than his preceding ones. But I am convinced that the witness told the truth. The steps of the new arrival were perceived subconsciously; the further disturbance of the perception hindered her occupation and finally, when she was frightened by the shot, the upper levels of consciousness were illuminated and the noises which had already reached the subconsciousness passed over the threshold and were consciously perceived.

I learned from an especially significant case, how the same thing could happen with regard to vision. A child was run over and killed by a careless coachman. A pensioned officer saw this through the window. His description was quite characteristic. It was the anniversary of a certain battle. The old gentleman, who stood by the window thinking about it and about his long-dead comrades, was looking blankly out into the street. The horrible cry of the unhappy child woke him up and he really began to see. Then he observed that he had in truth seen everything that had happened *before* the child was knocked over — *i.e.* for some reason the coachman had turned around, turning the horses in such a way at the same time that the latter jumped sidewise upon the frightened child, and hence the accident. The general expressed himself correctly in this fashion: "I saw it all, but I did not perceive and know that I saw it until *after* the

scream of the child." . . . His story was confirmed by other witnesses. This psychological process is of significance in criminal trials.

(b) *Mistakes of the Senses; Illusions.* As sensation is the basis of knowledge, the sensory process must be the basis of the correctness of legal procedure. The information we get from our senses and on which we construct our conclusion, may be said, all in all, to be reliable, so that we are not justified in approaching things we assume to depend on sense perception with exaggerated caution. Nevertheless, this perception is not always completely correct, and the knowledge of its mistakes must help us and even cause us to wonder that we make no greater ones.

Psychological examination of sense perception has been going on since Heraclitus. Most of the mistakes discovered have been used for various purposes, from sport to science. They are surprising and attract and sustain public attention; they have, hence, become familiar, but their influence upon other phenomena and their consequences in the daily life have rarely been studied. For two reasons. First, because such illusions seem to be small and their far-reaching effects are rarely thought of, as when, *e.g.*, a line drawn on paper seems longer or more inclined than it really is. Secondly, it is supposed that the influence of sensory illusions cannot easily make a difference in practical life. If the illusion is observed, it is thereby rendered harmless and can have no effect. If it is not observed and later on leads to serious consequences, their cause cannot possibly be sought out, because it cannot be recognized as such. . . .

Witnesses do not of course know that they have suffered from illusions of sense; we rarely hear them complain of it, anyway. And it is for this very reason that the criminalist must seek it out. The requirement involves great difficulties, for we get very little help from the immense literature on the subject. There are two roads to its fulfillment. In the first place, we must understand the phenomenon as it occurs in our work, and by tracing it back determine whether and which illusion of the sense may have caused an abnormal or otherwise unclear fact. The other road is the theoretical one, which must be called, in this respect, the preparatory road. It requires our mastery of all that is known of sense illusion and particularly of such examples of its hidden nature as exist. Much of the material of this kind is, however, irrelevant to our purpose, particularly all that deals with disease and lies in the field of medicine. . . . It is indubitable that we make many observations in which we get the absolute impression that matters of sensory illusion which do not seem to concern us lie behind some witnesses' observations, etc., although we cannot accurately indicate what they are. The only thing to do when this occurs is either to demonstrate the possibility of their presence or to wait for some later opportunity to test the witness for them.

Classification will ease our task a great deal. The apparently most important divisions are those of *normal* and *abnormal*. But as the boundary between them is indefinite, it would be well to consider that there is a third class which cannot fall under either heading. This is a class where especially a group of somatic conditions either favor or cause illusory sense perceptions, *e.g.* a rather over-loaded stomach, a rush of blood to the head, a wakeful night, physical or mental overexertion. . . .

Another question is the limit at which illusions of sense begin, how, in-

deed, they can be distinguished from correct perceptions. The possibility of doing so depends upon the typical construction of the sense organs in man. By one's self it would be impossible to determine which sensation is intrinsically correct and which is an illusion. There are a great many illusions of sense which all men suffer from under similar conditions, so that the judgment of the majority cannot be normative. Nor can the control of one sense by another serve to distinguish illusory from correct perception. In many cases it is quite possible to test the sense of sight by touch, or the sense of hearing by sight, but that is not always so. The simplest thing is to say that a sense impression is correct and implies reality when it remains identical under various circumstances, in various conditions, when connected with other senses, and observed by different men, with different instruments. It is illusory when it is not so constant.

I have found still another distinction which I consider important. It consists in the difference between real *illusions* and those false conceptions in which the mistake originates as *false inference*. In the former the sense organ has been really registering wrongly, as when, for example, the pupil of the eye is pressed laterally and everything is seen double. But when I see a landscape through a piece of red glass, and believe the landscape to be really red, the mistake is one of inference only, since I have not included the effect of the glass in my concluding conception. So, again, when in a rain I believe mountains to be nearer than they really are, or when I believe the stick in the water to be really bent, my sensations are perfectly correct, but my inferences are wrong. In the last instance, even a photograph will show the stick in water as bent.

This difference in the nature of illusion is particularly evident in those phenomena of expectation that people tend to miscall "illusions of sense." If, in church, anybody hears a dull, weak tone, he will believe that the organ is beginning to sound, because it is appropriate to assume that. In the presence of a train of steam cars which shows every sign of being ready to start you may easily get the illusion that it is already going. Now, how is the sense to have been mistaken in such cases? The ear has really heard a noise, the eye has really seen a train, and both have registered correctly, but it is not their function to qualify the impression they register, and if the imagination then effects a false inference, that cannot be called an illusion of sensation. . . .

The matter is different when we do not *properly estimate an uncusomary sense impression*. A light touch in an unaccustomed part of the body is felt as a heavy weight. After the loss of a tooth we feel an enormous cave in the mouth, and what a nonsensical idea we have of what is happening when the dentist is drilling a hole in a tooth! In all these cases the senses have received a new impression which they have not yet succeeded in judging properly, and hence, make a false announcement of the object. It is to this fact that all fundamentally incorrect judgments of new impressions must be attributed, — for example, when we pass from darkness into bright light and find it very sharp; when we find a cellar warm in winter that we believe to be ice-cold in summer; when we suppose ourselves to be high up in the air the first time we are on horseback, etc. Now, the actual presence of sensory illusions is especially important to us because we must make certain tests to determine whether testimony depends on them or

not, and it is of great moment to know whether the illusions depend on the individual's mind or on his senses. We may trust a man's intellect and not his senses, and conversely, from the very beginning.

It would be superfluous to insist on the importance of sensory illusion in the determination of a verdict. . . . There are many mistakes of judges based entirely on ignorance of this matter. Once a man who claimed, in spite of absolute darkness, to have recognized an opponent who punched him in the eye, was altogether believed, simply because it was assumed that the punch was so vigorous that the wounded man saw sparks by the light of which he could recognize the other. And yet already Aristotle knew that such sparks are only subjective. But that such things were believed is a notable warning.

2. *The Sense of Sight.* (a) *General Considerations.* Just as the sense of sight is the most dignified of all our senses, it is also the most important in the criminal court, for most witnesses testify as to what they have seen. If we compare sight with the hearing, which is next in the order of importance, we discover the well-known fact that what is seen is much more certain and trustworthy than what is heard. "It is better to see once than to hear ten times," says the universally valid old maxim. No exposition, no description, no complication which the data of other senses offer, can present half as much as even a fleeting glance. Hence, too, no sense can offer us such surprises as the sense of sight. . . . People know little of optical illusions and false visual perceptions, though they are aware that incorrect auditions are frequent matters of fact. Moreover, to the heard object a large number of more or less certain precautionary judgments are attached. If anybody, *e.g.*, has *heard* a shot, stealthy footsteps, crackling flames, we take his experience always to be *approximate*. We do not do so when he assures us he has *seen* these things or their causes. Then we take them — barring certain mistakes in observation — to be indubitable perceptions in which misunderstanding is impossible. . . .

The *visual process* itself consists, according to Fischer, "of a compounded series of results which succeed each other with extraordinary rapidity and are causally related." In this series the following elements may principally be distinguished: (1) The physicochemical process. (2) The physiologico-sensory. (3) The psychological. (4) The physiologicomotor. (5) The process of perception.

It is not our task to examine the first four elements. In order clearly to understand the variety of perception, we have to deal with the last only. I once tried to explain this by means of the phenomenon of instantaneous photographs (cinematographs). If we examine one while representing an instant in some quick movement, we will assert that we never could have perceived it in the movement itself. This indicates that our vision is slower than that of the photographic apparatus, and hence, that we do not apprehend the smallest particular conditions, but that we each time unconsciously compound a group of the smallest conditions and construct in that way the so-called instantaneous impressions. If we are to compound a great series of instantaneous impressions in one galloping step, we must have condensed and compounded a number of them in order to get the image that we see with our eyes as instantaneous. We may therefore say that the least instantaneous image we ever see with our eyes con-

tains many parts which only the photographic apparatus can grasp. Suppose we call these particular instances a, b, c, d, e, f, g, h, i, j, k, l, m; it is self-evident that the manner of their composition must vary with each individual. One man may compound his elements in groups of three: a, b, c, — d, e, f, — g, h, i, etc.; another may proceed in dyads: a, b, — c, d, — e, f, — g, h, — etc.; a third may have seen an unobservable instant later, but constructs his image like the first man: b, c, d, — l, m, n, etc.; a fourth works slowly and rather inaccurately, getting: a, c, d, — f, h, i, — etc. Such variations multiply, and when various observers of the same event describe it, they do it according to their different characteristics. And the differences may be tremendous. Substitute numerals for letters and the thing becomes clear.

The *relative slowness of our apprehension* of visual elements has the other consequence that we *interpolate* objects in the lacunæ of vision *according to our expectations*. The best example of this sort of thing would be the perception of assault and battery. When ten people in an inn see how A raises a beer glass against B's head, five expect: "Now he'll pound him," and five others: "Now he'll throw it." If the glass has reached B's head none of the ten observers have seen how it reached there, but the first five take their oath that A pounded B with the glass, and the other five that he threw it at B's head. And all ten have really seen it, so firmly are they convinced of the correctness of their swift judgment of expectation. Now, before we treat the witness to some reproach like untruth, inattention, silliness, or something equally nice, *we* had better consider whether his story is not true, and whether the difficulty might not really lie in the imperfection of our own sensory processes. This involves partly what Liebmann has called "*anthropocentric vision*," *i.e.* seeing with man as the center of things. Liebmann further asserts, "that we see things only in perspective sizes, *i.e.* only from an angle of vision varying with their approach, withdrawal and change of position, but in no sense as definite cubical, linear, or surface sizes. The apparent size of an object we call an angle of vision at a certain distance. But, what indeed is the different, true size? We know only relations of magnitude."

This description is important when we are dealing with testimony concerning *size*. It seems obvious that each witness who speaks of size is to be asked whence he had observed it, but at the same time a great many unexpected errors occur, especially when what is involved is the determination of the size of an object in the same plane. One need only to recall the meeting of railway tracks, streets, alleys, etc., and to remember how different in size, according to the point of view of the witness, various objects in such places must appear. Everybody knows that distant things seem smaller than near ones, but almost nobody knows what the difference amounts to. . . .

In addition we often think that the clearness of an object represents its *distance* and suppose that the first alone determines the latter. But the distinctness of objects, *i.e.* the perceptibility of a light impression, depends also upon the absolute brightness and the differences in brightness. The latter is more important than is supposed. Try to determine how far away you can see a keyhole when the wall containing the door is in the shadow, and when there is a window opposite the keyhole. A dark object of the

size of a keyhole will not be visible at one hundredth of the distance at which the keyhole is perceived. Moreover, the difference in intensity is not alone in consideration; the intensity of the object with regard to its background has yet to be considered. Aubert has shown that mistakes often occur, so that a man dressed in dark clothes but in full light will be described as wearing lighter clothes than one who wears light clothes in the shadow.

Differences of *illumination* reveal a number of phenomena difficult to explain. . . . If, in daylight, we look into a basement room from outside, we can perceive nothing, almost; everything is dark, even the windows appear black. But in the evening, if the room is ever so slightly illuminated, and we look into it from outside, we can see even small articles distinctly. Yet there was much intenser light in the room in question during the day than the single illumination of the night could have provided. . . . It is often said that a witness was able to see this or that under such and such illumination, or that he was unable to see it, although he denies his ability or inability. The only solution of such contradictions is an experiment. The attempt must be made either by the judge or some reliable third person, to discover whether, under the same conditions of illumination, anything could be seen at the place in question or not.

As to *what* may be seen in the *distance*, experiment, again, is the best judge. The human eye is so very different in each man that even the acute examination into what is known of the visual image of the Pleiades shows that the *average* visual capacity of classic periods is no different from our own, but still that there was great variety in visual capacity. What enormous visual power is attributed to half-civilized and barbarous peoples, especially Indians, Eskimos, etc. ! Likewise among our own people there are hunters, mountain guides, etc., who can see so clearly in the distance that mere stories about it might be fables. In the Bosnian campaign of 1878 we had a soldier who in numerous cases of our great need to know the enemy's position in the distance could distinguish it with greater accuracy than we with our good field glasses. He was the son of a coal miner in the Styrian mountains, and rather a fool. Incidentally it may be added that he had an incredible, almost animal power of orientation.

In addition to the natural differences of sight there are also those *artificially* created. How much we may help ourselves by skillful distinctions, we can recognize in the well-known and frequently mentioned business of reading a confused handwriting. We aim to weaken our sense perception in favor of our imagination, *i.e.* so to reduce the clearness of the former as to be able to test upon it in some degree a larger number of images. We hold the Ms. away from us, look at it askant, with contracted eyebrows, in different lights, and finally we read it. Again, the converse occurs. If we have seen something with a magnifying glass, we later recognize details without its help. Definite conditions may bring to light very great distinctions. A body close to the face or in the middle distance looks different according as one eye or both be used in examining it. This is an old story and explains the queer descriptions we receive of such objects as weapons and the like, which were suddenly held before the face of the deponent. In cases of murderous assault it is certain that most uncanny stories are told, later explained by fear or total confusion or intentional dis-

honesty, but really to be explained by nothing more than actual optical processes. . . .

Concerning *color vision* only a few facts will be mentioned. . . . (3) It is well known that in the diminution of brightnesses red disappears before blue, and that at night, when all colors have disappeared, the blue of heaven is still visible. So if anybody asserts that he has been able to see the blue of a man's coat but not his red-brown trousers, his statement is possibly true, while the converse would be untrue. . . . (7) According to Aubert, sparkle consists of the fact that one point in a body is very bright while the brightness diminishes almost absolutely from that point. . . . It is therefore conceivable that at a great distance, under conditions of sharp or accidental illuminations, etc., we are likely to see things as sparkling which do not do so in the least. . . .

Everybody knows what the *blind spot* is, and every psychology and physiology textbook talks about it. . . . According to Helmholtz: "The effect of the blind spot is very significant. If we make a little cross on a piece of paper and then a spot the size of a pea two inches to the right, and if we look at the cross with the left eye closed, the spot disappears. The size of the blind spot is large enough to cover in the heavens a plate which has twelve times the diameter of the moon. It may cover a human face at a distance of 6', but we do not observe this because we generally fill out the void. If we see a line in the place in question, we see it unbroken, because we know it to be so, and therefore supply the missing part." . . .

I have not met with a practical case in which some fact or testimony could be explained only by the blind spot, but such cases are conceivable.

(b) *Illusions of Sight*. It will be best to begin the study of optical illusions with the consideration of those conditions which cause extraordinary, lunatic images. They are important because the illusion is recognizable with respect to the possibility of varied interpretations by any observer, and because anybody may experiment for himself with a bit of paper on the nature of false optical apprehension. If we should demonstrate no more than that the simplest conditions often involve coarse mistakes, much will have been accomplished for the law, since the "irrefutable evidence" of our senses would then show itself to need corroboration. Nothing is proved with "I have seen it myself," for a mistake in one point shows the equal possibility of mistakes in all other points.

Generally, it may be said that the position of lines is not without influence on the estimation of their size. Perpendicular dimensions are taken to be somewhat greater than they are. Of two crossed lines, the vertical one seems longer, although it is really equal to the horizontal one. An oblong, lying on its somewhat longer side, is taken to be a square; if we set it on the shorter side it seems to be still more oblong than it really is. . . . It will hardly be believed, and certainly is not consciously known, that in the letter S the upper curve has a definitely smaller radius than the lower one; but the inverted S shows this at once. To such types other false estimations belong: inclinations, roofs, etc., appear so steep in the distance that it is said to be impossible to move on them without especial help. But whoever does move on them finds the inclination not at all so great. . . .

Such confusions become most troublesome when other estimations are added to them. So long as the informant knows that he has only been

estimating, the danger is not too great. But as a rule the informant does not regard his conception as an estimate, but as certain knowledge. He does not say, "I estimate"; he says, "It is so." Aubert tells how the astronomer Förster had a number of educated men, physicians, etc., estimate the diameter of the moon. The estimation varied from 1" to 8" and more. The proper diameter is 1.5" at a distance of 12."

It is well known that an unfurnished room seems much smaller than a furnished one, and a lawn covered with snow, smaller than a thickly grown one. We are regularly surprised when we find an enormous new structure on an apparently small lot, or when a lot is parceled out into smaller building lots. When they are planked off we marvel at the number of planks which can be laid on the surface. The illusions are still greater when we look forward. We are less accustomed to estimation of verticals than of horizontals. An object on the gutter of a roof seems much smaller than at a similar distance on the ground. Aërial perspective has a great influence on the determination of these phenomena, particularly such as occur in the open and at great distances. . . . The condition of the air, sometimes foggy and not pellucid, at another time particularly clear, makes an enormous difference, and statements whether about distance, size, colors, etc., are completely unreliable. A witness who has several times observed an unknown region in murky weather and has made his important observation under very clear skies, is not to be trusted. . . .

To all these illusions may be added those which are connected with movement or are exposed by movement. During the movement of certain bodies we can distinguish their form only under definite conditions. As their movement increases they seem shorter in the direction of movement and as it decreases they seem broader than normally. An express train with many cars seems shorter when moving directly near us, and rows of marching men seem longer. . . . As a rule, optical illusions occur when there is an interruption in the communication between the retina, the sense of movement, and the sense of touch, or when we are prevented from reducing the changes of the retinal image to the movement of our body or of our eyes. This reduction goes on so unconsciously that we see the idea of the object and its condition as a unit. Again, it is indubitable that the movement of the body seems quicker when we observe it with a fixed glance than when we follow it with our eyes. The difference may be so significant that it is often worth while, when much depends on determining the speed of some act in a criminal case, to ask how the thing was looked at.

The so-called *captivation of our visual capacity* plays a not unimportant part in distinguishing correct from illusory seeing. In order to see correctly we must look straight and fully at the object. Looking askance gives only an approximate image, and permits the imagination free play. Anybody lost in a brown study who pictures some point in the room across the way with his eyes can easily mistake a fly, which he sees confusedly askance, for a great big bird. . . . These examples indicate how indirect vision may be corrected by later correct vision, but such correction occurs rarely. We see something indirectly; we find it uninteresting, and do not look at it directly. When it becomes of importance later on, perhaps enters into a criminal case, we think that we have seen the thing as it is, and often swear that "a fly is a big bird."

These illusions again, I must repeat, are of no importance if they are at all doubted, for then the truth is ascertained. When, however, they are not doubted and are sworn to, they cause the greatest confusion in trials. A barroom quarrel, a swung cane, and a red handkerchief on the head, are enough to make people testify to having seen a great brawl with bloody heads. A gnawing rat, a window accidentally left open through the night, and some misplaced, not instantaneously discovered object, are the ingredients of a burglary. . . .

3. *The Sense of Hearing.* (a) *General Considerations.* We have two problems with regard to sound — whether the witnesses have heard correctly, and whether we hear them correctly. Between both witnesses and ourselves there are again other factors. Correct comprehension, faithful memory, the activity of the imagination, the variety of influences, the degree of personal integrity; but most important is the consideration, whether the witness has heard correctly. As a general thing we must deny in most cases completely accurate reproduction of what witnesses have heard. In this connection dealing with questions of honor is instructive. If the question is the recall of slander, the terms of it will be as various as the number of witnesses. We discover that the sense, the tendency of slander, is not easily mistaken. At least if it is, I have not observed it. The witness, *e.g.* will confuse the words “scamp,” “cheat,” “swindler,” etc., and again the words: “ox,” “donkey,” “numbskull,” etc. But he will not say that he has heard “scamp” where what was said was “donkey.” He simply has observed that A has insulted B with an epithet of moral turpitude or of stupidity and under examination he inserts an appropriate term. Often people hear only according to meanings, and hence the difficulty of getting them to reproduce verbally and directly something said by a third person. They always engage upon indirect narration because they have heard only the meaning, not the words. Now if the witnesses only reproduced the actual meaning of what they heard, no harm would be done, but they tell us only what they *suppose* to be the meaning, and hence we get a good many mistakes. It does seem as if uneducated and half-educated people are able to shut their ears to all things they do not understand. Even purely sensory perception is organized according to intelligent capacity.

The determination of auditory power is, however, insufficient, for this *power varies* with the degree any individual can distinguish a single definite tone among many, hear it alone, and retain it. And this varies not only with the individual but also with the time, the place, the voice, etc. . . .

It is repeatedly asserted, *e.g.* by Tyndall, that a comparatively large number of people do not hear high tones like the chirping of crickets, although the normal hearing of such people is acute. Others again easily sense deep tones, but distinguish them with difficulty because they retain only a roll or roar, but do not hear the individual tones. And generally, almost all people have difficulty in making a correct valuation of the direction of sound. Wundt says that we locate powerful sounds in front of us and are generally better able to judge right and left than before and behind. These data, which are for us quite important, have been subjected to many tests. Wundt's statement has been confirmed by various experiments which have shown that sound to the right and the left are best distinguished,

and sounds in front and below, in front to the right and to the left, and below, to the right and to the left, are least easily distinguished. Among the experimenters were Preyer, Arnheim, Kries, Münsterberg.

All these experiments indicate certain constant tendencies to definite mistakes. Sounds in front are often mistaken for sounds behind and felt to be higher than their natural head level. Again, it is generally asserted that binaural hearing is of great importance for the recognition of the direction of sound. With one ear this recognition is much more difficult. This may be verified by the fact that we turn our heads here and there as though to compare directions whenever we want to make sure of the direction of sound. In this regard, too, a number of effective experiments have been made.

When it is necessary to determine whether the witness deposes correctly concerning the direction of sound, it is best to get the official physician to find out whether he hears with both ears, and whether he hears equally well with both. It is observed that persons who hear excellently with both ears are unfortunate in judging the direction of sound. Others again are very skillful in this matter, and may possibly get their skill from practice, sense of locality, etc. But in any case, certainty can be obtained only by experimentation.

The differences that *age* makes in hearing are of importance. Bezold has examined a large number of human ears of different ages and indicates that after the fiftieth year there is not only a successive decrease in the number of the approximately normal hearing, but there is a successively growing increase in the degree of auditory limitation which the ear experiences with increasing age. The results are more surprising than is supposed. Not one of 100 people over fifty years of age could understand conversational speech at a distance of 16 meters; 10.5 per cent understood it at a distance of 8 to 16 meters. Of school children 46.5 per cent (1918 of them) from seven to eighteen understood it at a distance of 20 meters plus, and 32.7 per cent at a distance of from 16 to 8 meters. The percentage then is 10.5 for people over fifty as against 79.2 of people over seven and under eighteen. Old women can hear better than old men. At a distance of 4 to 16 meters the proportion of women to men who could hear was 34 to 17. The converse is true of children, for at a distance of 20 meters and more the percentage of boys was 49.9 and girls 43.2. The reason for this inversion of the relation lies in the harmful influences of manual labor and other noisy occupations of men. These comparisons may be of importance when the question is raised as to how much more a witness may have heard than one of a different age.

(b) *Illusions of Hearing.* From the point of view of the criminalist, auditory illusions are hardly less significant than visual illusions, the more so, as incorrect hearing is much more frequent than incorrect seeing. This is due to the greater similarity of tones to each other, and this similarity is due to the fact that sound has only one dimension, while vision involves not only three, but also color. . . .

The study of auditory illusions is rendered especially difficult by the rarity of their repetition, which makes it impossible reliably to exclude accidents and mistakes in observation. . . . I made an observation at a bicycle school. As is known, beginners are able frequently to ride by themselves, but need help in mounting and dismounting their machines. To do so,

they call a teacher by crying out: "Herr Maier." At a certain place this sound would seem distinctly to be "mamma." I was at first much surprised to hear people of advanced age cry cheerfully, "mamma." Later I discovered what the word really was, and acquaintances whose attention I called to the matter confirmed my observation. Such things are not indifferent; they show that really very different sounds may be mistaken for one another, that the test of misunderstandings may often lead to false results, since only during the test of an illusion are both auditor and speaker accurately in the same position as before. Finally, these things show that the whole business of correcting some false auditions is very difficult. . . .

As regards the general treatment of auditory illusions, it is necessary, first of all, to consider their many and significant differences. In the first place, there are the *varieties of good hearing*. That normal and abnormal hearers vary in degree of power is well known. There are also several special conditions, causing, *e.g.* the so-called hyperauditive, who hear more acutely than normal people. Of course, such assertions as those which cite people who can hear the noise of sulphur rubbed on the poles of quartz crystals and so on, are incorrect, but it is certain that a little attention will reveal a surprising number of people whose hearing is far acuter than that of normal individuals. Apart from children, the class is made up of musicians, of young girls, and of very nervous, excitable, and sickly persons. The musicians in fact have become so because of their ears; the young girls hear well largely because of their delicate organization and the very fine construction of their ears; and the nervous people because of their sensibility to the pain involved in loud noises. Many differences of perception among witnesses are to be explained by differences of audition, and the reality of apparent impossibilities in hearing must not be denied, but must be tested under proper conditions. One of these conditions is location. The difference between hearing things in the noisy day and in the quiet night, in the roar of the city, or in the quiet of the mountains, is familiar. . . .

The illusions of hearing which completely normal people are subject to are the most difficult of all. Their number and frequency is variously estimated. The physician has nothing to do with them. The physicist, the acoustician, and physiologist do not care about the criminalist's needs in this matter, and we ourselves rarely have time and opportunity to deal with it. As a result our information is very small, and no one can say how much is still undiscovered. . . . Certain dispositions make some difference in this respect. The operating physician hears the low groaning of the patient after the operation without having heard his loud cries during the operation. During the operation the physician must not hear anything that is likely to disturb his work, but the low groan has simply borne in upon him. The sleeping mother often is deaf to considerable noise, but wakes up immediately when her child draws a deeper breath than usual. Millers and factory hands, travelers, etc., do not hear the pounding of their various habitual environmental noises, but they perceive the slightest call, and everybody observes the considerable murmur of the world, the sum of all distant noises, only in the silence of the night that misses it.

Illusions of *direction* of sound are very common. It is said that even animals are subject to them; and everybody knows how few human beings

can distinguish the source and direction of street music, a rolling wagon, or a ringing bell. . . .

All these enumerated circumstances must show how very uncertain all acoustic perceptions are, and how little they may be trusted if they are not carefully tested under similar conditions, and if — what is most important — they are not isolated. We are here led back to the old principle that every observation is not proof, but means of proof, and that it may be trusted only when it is confirmed by many parallel actions which are really consistent. . . .

4. *The Sense of Taste.* (a) *General Considerations.* The sense of taste is rarely of legal importance, but when it does come into importance it is regularly very significant because it involves, in the main, problems of poisoning. . . . At the same time, it is necessary, when tests are made, to depend upon general, and rarely constant impressions, since very few people mean the same thing by, stinging, prickly, metallic, and burning tastes, even though the ordinary terms sweet, sour, bitter, and salty, may be accepted as approximately constant. . . .

(b) *Illusions of Taste.* Illusions of taste are of importance for us only in cases of poisoning in which we want the assistance of the victim, or desire to taste the poison in question in order to determine its nature. That taste and odor are particularly difficult to get any unanimity about is an old story, and it follows that it is still more difficult clearly to understand possible illusions of these senses. . . . Intermittent fevers tend to cause, when there is no attack and the patient feels comparatively well, a large number of metallic, particularly coppery, tastes. If this is true, it may lead to unjustified suspicions of poisoning, inasmuch as the phenomena of intermittent fever are so various that they cannot all be identified.

Imagination makes considerable difference here. . . . The eye has especial influence, and the story cited and denied a hundred times, that in the dark, red wine and white wine, chicken and goose, cannot be distinguished, that the going out of a cigar is not noted, etc., is true. With your eyes closed it may be possible to eat an onion instead of an apple.

Prior tastes may cause significant gustatory illusions. Hence, when assertions are made about tastes, it is always necessary to inquire at the outset what had been eaten or drunk before. . . . All in all, it must not be forgotten that the reliability of the sense of taste cannot be estimated too low. The illusions are greatest especially when a thing has been tasted with a preconceived notion of its taste.

5. *The Sense of Smell.* (a) *General Considerations.* The sense of smell would be of great importance for legal consideration if it could get the study it deserves. It may be said that many men have more acute olfactory powers than they know, and that they may learn more by means of them than by means of the other senses. The sense of smell has little especial practical importance. It only serves to supply a great many people with occasional disagreeable impressions, and what men fail to find especially necessary they do not easily make use of. The utility of smell would be great because it is accurate, and hence powerful in its associative quality. But it is rarely attended to; even when the associations are awakened, they are not ascribed to the sense of smell, but are said to be accidental. . . .

(b) *Illusions of Smell.* Olfactory illusions are very rare in healthy people and are hence of small importance. They are frequent among the mentally

diseased. . . . The largest number of olfactory illusions are due to imagination. Carpenter's frequently cited case of the officials who smelled a corpse while a coffin was being dug up, until finally the coffin was found to be empty, has many fellows. . . . Statements by witnesses concerning perceptions of odor are valueless unless otherwise confirmed.

6. *The Sense of Touch.* (a) *General Considerations.* I combine, for the sake of simplicity, the senses of location, pressure, temperature, etc., under the general expression: sense of touch. The problem this sense raises is no light one because many witnesses tell of perceptions made in the dark or when they were otherwise unable to see, and because much is perceived by means of this sense in assaults, wounds, and other contacts. In most cases such witnesses have been unable to regard the touched parts of their bodies, so that we have to depend upon this touch sense alone. Full certainty is possible only when sight and touch have worked together and rectified one another.

The deceptive possibilities in touch are seen in the well-known mistakes to which one is subjected in blind touching. At the same time practice leads to considerable accuracy in touch, and on many occasions the sense is trusted more than sight — *e.g.* whenever we test the delicacy of an object with our fingertips. The fineness of paper, leather, the smoothness of a surface, the presence of points, are always tested with the fingers. . . . Whoever has to depend much on the sense of touch increases its field of perception, as we know from the delicacy of the sense in blind people. The statements of the blind concerning their contact sensations may be believed even when they seem improbable; there are blind persons who may feel the very color of fabrics, because the various pigments and their medium give a different surface quality to the cloth they color. In another direction, again, it is the deaf who have especial power. So, we are assured by Abercrombie that in his medical practice he had frequently observed how deaf people will perceive the roll of an approaching wagon, or the approach of a person, long before people with good hearing do so.

It is important to know what a *wounded man* and his enemy feel in the first instant of the crime and in what degree their testimonies are reliable. First of all, we have to thank the excellent observations of Weber, for the knowledge that we find it very difficult to discover with closed eyes the angle made by a dagger thrust against the body. It is equally difficult to determine the direction from which a push or blow has come. On the other hand, we can tell very accurately in what direction a handful of hair is pulled. With regard to the time it takes to feel contact and *pain*, it is asserted that a short powerful blow on a corn is felt immediately, but the pain of it one to two seconds later. It may be that corns have an especial constitution, but otherwise the time assigned before feeling pain is far too long. . . . We can only say that the perception of a peripheral pain occurs an observable period after the shock, *i.e.* about a third of a second later than its cause.

The sensation of a *stab* is often identified as contact with a hot object, and it is further asserted that the wounded person feels close to the pain which accompanies the push or the cut, the cold of the blade, and its presence in the depths of his body. So far as I have been able to learn from wounded people, these assertions are not confirmed. Setting aside individuals who exaggerate intentionally and want to make themselves interesting or to indicate

considerable damage, all answers point to the fact that stabs, shots, and blows are sensed as pushes. In addition, the rising of the blood is felt almost immediately, but nothing else; pain comes much later. . . .

(b) *Illusions of Touch.* The high standing of the sense of touch which makes it in certain directions even the organ of control of the sense of sight, is well known, and Condillac's historic attempt to derive all the senses from this one is still plausible. If what is seen is to be seen accurately, there is automatic resort to the confirmatory aid of the sense of touch, which apprehends what the eye has missed. . . .

But important and reliable as the sense of touch is, it is nevertheless not to be trusted when it is the sole instrument of perception. We must never depend on the testimony of a witness based entirely on perceptions by touch, and the statements of a wounded person concerning the time, manner, etc., of his wound are unreliable unless he has also seen what he has felt. We know that most knife and bullet wounds, i.e. the most dangerous ones, are felt, in the first instance, as not very powerful blows. Blows on the extremities are not felt as such, but rather as pain, and blows on the head are regularly estimated in terms of pain, and falsely with regard to their strength. If they were powerful enough to cause unconsciousness, they are said to have been very massive, but if they have not had that effect, they will be described by the most honest of witnesses as much more powerful than they actually were. Concerning the location of a wound in the back, in the side, even in the upper arm, the wounded person can give only general indications, and if he correctly indicates the seat of the wound, he has learned it later but did not know it when it occurred. According to Helmholtz, practically all abdominal sensations are attributed to the anterior abdominal wall. Now such matters become of importance when an individual has suffered several wounds in a brawl or an assault and wants to say certainly that he got wound A when X appeared, wound B when Y struck at him, etc. These assertions are almost all false because the victim is likely to identify the pain of the moment of receiving the wound with its later painfulness. If, for example, an individual has received a rather long but shallow knife wound and a deep stab in the back, the first will cause him a very considerable burning sensation, the latter only the feeling of a heavy blow. Later on, at the examination, the cut has healed and is no longer painful; the dangerous stab which may have reached the lung, causes pain and great difficulty in breathing, so that the wounded man assigns the incidence of the stab to the painful sensation of the cut, and conversely. . . .

There are many examples of the fact that *uncontrolled touch* leads to false perceptions. Modern psychophysics has pointed to a large group of false perceptions due to illusions of pressure, stabs, or other contact with the skin. The best known and criminalistically most important experiments, are those with open compasses. Pressed on the less sensitive parts of the body, the back, the thigh, etc., they are always felt as one, although they are quite far apart. . . . Similarly, mere touch cannot give us proper control over the organs of the body. . . . This shows that the tactile sense is not in a very high stage of development, since it needs, when unhelped by long experience, the assistance of the sense of sight. Perceptions through touch alone, therefore, are of small importance. . . . This is shown by a youthful game we used to play. It consisted of stretching certain harmless

things under the table — a soft piece of dough, a peeled, damp potato stuck on a bit of wood, a wet glove filled with sand, the spirally cut rind of a beet, etc. Whoever got one of these objects without seeing it thought he was holding some disgusting thing and threw it away. His sense of touch could present only the dampness, the coldness, and the motion, *i.e.* the coarsest traits of reptilian life, and the imagination built these up into a reptile and caused the consequent action. Foolish as this game seems, it is criminalistically instructive. It indicates what unbelievable illusions the sense of touch is capable of causing. To this inadequacy of the tactile imagination may be added a sort of transferability of certain touch sensations. For example, if ants are busy near my seat, I immediately feel that ants are running about under my clothes, and if I see a wound or hear it described, I often feel pain in the analogous place on my own body. That this may lead to considerable illusion in excitable witnesses is obvious.

II. *Perception and Conception.* What lawyers have to consider in the transition from purely sensory impressions to intellectual conceptions of these impressions, is the possibility of later reproducing any observed object or event. Many so-called scientific distinctions have, under the impulse of scientific psychology, lost their status. Modern psychology does not see sharply drawn boundaries between perception and memory, and suggests that the proper solution of the problem of perception is the solution of the problem of knowledge.

With regard to the relation of consciousness to perception we will make the distinctions made by Fischer. There are two spheres or regions of consciousness: the region of sensation, and of external perception. The former involves the inner structure of the organism; the latter passes from the organism into the objective world. Consciousness has a sphere of action in which it deals with the external world by means of the motor nerves and muscles, and a sphere of perception which is the business of the senses. External perception involves three principal functions: apprehension, differentiation, and combination. Perception in this narrower sense of the term is the simple sensory conscious apprehension of some present object stimulating our eyes. We discover by means of it what the object is, its relation to ourselves and other things, its distance from us, its name, etc.

What succeeds this apprehension is the most important thing for us lawyers, *i.e.* *recognition*. Recognition indicates only that an object has sufficiently impressed a mind to keep it known and identifiable. It is indifferent what the nature of the recognized object is. According to Hume the object may be an enduring thing ("noninterrupted and nondependent on mind"), or it may be identical with perception itself. In the latter case the perception is considered as a logical judgment like the judgment: "It is raining," or the feeling that "it is raining," and there recognition is only the recognition of a perception. Now judgments of this sort are what we get from witnesses, and what we have to examine and evaluate. . . .

The essential mistakes are classified by Schiel under two headings. Mistakes in observation are positive or negative, wrong observation or oversight. The latter occurs largely through preconceived opinions. The opponents of Copernicus concluded that the earth did not move because otherwise a stone dropped from the top of a tower would reach the ground a

little to the west. If the adherents of Copernicus had made the experiment, they would have discovered that the stone does fall as the theory requires. Similar oversights occur in the lawyer's work hundreds of times. We are impressed with exceptions that are made by others or by ourselves, and give up some already tried approach without actually testing the truth of the exception which challenges it. I have frequently, while at work, thought of the story of some one of the Georges, who did not like scholars and set the following problem to a number of philosophers and physicists: "When I put a ten-pound stone into a hundred-pound barrel of water the whole weighs a hundred and ten pounds, but when I put a live fish of ten pounds into the barrel the whole still weighs only a hundred pounds?" Each one of the scholars had his own convincing explanation, until finally the king asked one of the footmen, who said that he would like to see the experiment tried before he made up his mind. I remember a case in which a peasant was accused of having committed arson for the sake of the insurance. He asserted that he had gone into a room with a candle and that a long spider's web which was hanging down had caught fire from it accidentally and had inflamed the straw which hung from the roof. So the catastrophe had occurred. Only in the second examination did it occur to anybody to ask whether spider's web can burn at all, and the first experiment showed that that was impossible. Most experiences of this kind indicate that in recognizing events we must proceed slowly, without leaping, and that we may construct our notions only on the basis of knowledge we already possess. Saint Thomas says, "Omnis cognitio fit secundum similitudinem cogniti in cognoscente."

If this bit of wisdom were kept in mind in the examination of witnesses, it would be an easier and simpler task than usual. . . . It naturally is not necessary to ask whether a narrator has ever seen the things he speaks of, nor to convince one's self in examination that the person in question knows accurately what he is talking about. At the same time, the examiner ought to be clear on the matter and know what attitude to take if he is going to deal intelligibly with the other. I might say that all of us, educated and uneducated, have apprehended and remember definite and distinct images of all things we have seen, heard, or learned from descriptions. When we get new information we simply attach the new image to the old, or extinguish a part of the old and put the new in its place, or we retain only a more or less vigorous breath of the old with the new.

The fact that a good deal of what is said is incorrect and yet not consciously untrue, depends upon the existence of these images and their association with the new material. The speaker and the auditor have different sets of images; the first relates the new material differently from a second, and so of course they cannot agree. . . .

The great trouble consists in once for all discovering *what memory images were present before the witness perceived* the event in question. The former have a great influence upon the perception of the latter. . . .

No one can determine the boundary where the sense activity ends and the intellectual begins. Somebody has noted the interesting fact that not one of twenty students in an Egyptian museum knew why the hands of the figures of Egyptian wall pictures gave the impression of being incorrect — nobody had observed the fact that all the figures had two right hands. I

once paid a great deal of attention to card-sharping tricks, and as I acquired them, either of myself or from practiced gamblers, I demonstrated them to the young criminalists. For a long time I refused to believe what an old Greek told me: "The more foolish and obvious a trick is, the more certain it is; people never see anything." The man was right. When I told my pupils expressly, "Now I am cheating," I was able to make with safety a false coup, a false deal, etc. Nobody saw it. If only one has half a notion of directing the eyes to some other thing, a card may be laid on the lap, thrust into the sleeve, taken from the pocket, and God knows what else. Now who can say in such a case whether the sensory glance or the intellectual apprehension was unskillful or unpracticed? According to some authorities the chief source of error is the senses, but whether something must not be attributed to that mysterious, inexplicable moment in which sensory perception becomes intellectual perception, nobody can say.

My favorite demonstration of how surprisingly little people perceive is quite simple. I set a tray with a bottle of water and several glasses on the table, call express attention to what is about to occur, and pour a little water from the bottle into the glass. Then the stuff is taken away and the astonishing question asked what have I done? All the spectators reply immediately: you have poured water into a glass. Then I ask further with what hand did I do it? How many glasses were there? Where was the glass into which I poured the water? How much did I pour? How much water was there in the glass? Did I really pour or just pretend to? How full was the bottle? Was it certainly water and not, perhaps, wine? Was it not red wine? What did I do with my hand after pouring the water? How did I look when I did it? Did you not really see that I shut my eyes? Did you not really see that I stuck my tongue out? Was I pouring the water while I did it? Or before, or after? Did I wear a ring on my hand? Was my cuff visible? What was the position of my fingers while I held the glass? These questions may be multiplied. And it is as astonishing as amusing to see how little correctness there is in the answers, and how people quarrel about the answers, and what extraordinary things they say. Yet what do we require of witnesses who have to describe much more complicated matters to which their attention had not been previously called, and who have to make their answers, not immediately, but much later; and who, moreover, may, in the presence of the fact, have been overcome by fear, astonishment, terror, etc. . . . At a trial a circumstantial and accurate attempt was made to discover whether it was a significant alteration to bite a man's ear off. The court, the physician, the witnesses, etc., dealt with the question of altering, until finally the wounded man himself showed what was meant, because his other ear had been bitten off many years before, — but then nobody had noticed that mutilated ear.

In order to know what another person has seen and apprehended we must first of all know how he thinks, and that is impossible. If we know, at least approximately, the kind of mental process of a person who is as close as possible to us in sex, age, culture, position, experience, etc., we lose this knowledge with every step that leads to differences. We know well what great influence is exercised by the multiplicity of talents, superpositions, knowledge, and apprehensions. . . . Exner calls attention to the fact that it is in this direction especially, that the "dark perceptions" play a great

rôle. "A great part of our intelligence depends on the ability of these 'dark perceptions' to rise without requiring further attention, into the field of consciousness. There are people, *e.g.*, who recognize birds in their flight without knowing clearly what the characteristic flight for any definite bird may be. Others, still more intelligent, know at what intervals the flyers beat their wings, for they can imitate them with their hands. And when the intelligence is still greater, it makes possible a correct description in words." Suppose that in some important criminal case several people, of different degrees of education and intelligence, have made observations. We suppose that they all want to tell the truth, and we also suppose that they have observed and apprehended their objects correctly. Their testimonies, nevertheless, will be very different. With the degree of intelligence rises the degree of effect of the "dark subconscious perceptions." They give more definite presentation and explanation of the testimony; they turn bare assertions into well-ordered perceptions and real representations. But we generally make the mistake of ascribing the variety of evidence to varying views, or to dishonesty.

III. *Imagination.* (a) *General Considerations.* The things witnesses tell us have formerly existed in their imaginations, and the *how* of this existence determines in a large degree the *quale* of what they offer us. Hence, the nature of imagination must be of interest to us, and the more so, as we need not concern ourselves with the relation between being and imagination. . . . When we speak with a witness, however, we rarely know the conditions under which he has obtained his images, and we learn them only from him. Now it happens that the description offered by the witness adds another image, *i.e.* our own image of the matter, and this, and that of the witness, have to be placed in specific relation to each other. Out of the individual images of all concerned an image should be provided which implies the image of the represented event. Images can be compared only with images, or images are only pictures of images.

The difficulty of this transmutation lies fundamentally in the nature of representation. Representation can never be identical with its object. Helmholtz has made this most clear: "Our visions and representations are effects; objects seen and represented have worked on our nervous system and on our consciousness. The nature of each effect depends necessarily upon the nature of its cause, and the nature of the individual upon whom the cause was at work. To demand an image which should absolutely reproduce its object and therefore be absolutely true, would be to demand an effect which should be absolutely independent of the nature of that object on which the effect is caused. And this is an obvious contradiction." What the difference between image and object consists of, whether it is merely formal or material, how much it matters, has not yet been scientifically proved and may never be so. We have to assume only that the validity of this distinction is universally known, and that everybody possesses an innate corrective with which he assigns proper place to image and object, *i.e.* he knows approximately the distinction between them. The difficulty lies in the fact that not all people possess an identical standard, and that upon the creation of the latter practically all human qualities exert an influence.

We get this situation in miniature each time we hear of a crime, however

barren the news may be, — no more than a telegraphic word. The event must naturally have some degree of importance, because, if I hear merely that a silver watch has been stolen, I do not try to imagine that situation. If, however, I hear that near a hostelry in X, a peasant was robbed by two traveling apprentices, I immediately get an image which contains not only the unknown region, but also the event of the robbery, and even perhaps the faces of those concerned. It does not much matter that this image is completely false in practically every detail, because in the greater number of cases it is corrected. The real danger lies in the fact that this correction is frequently so bad and often fails altogether and that, in consequence, the first image again breaks through and remains the most vigorous.

(b) *The Subconscious.* It is my opinion that the importance of unconscious operations in legal procedure is undervalued. We could establish much that is significant concerning an individual whose unconscious doings we knew. For, as a rule, we perform unconsciously things that are deeply habitual, therefore, first of all what everybody does — walk, greet your neighbor, dodge, eat, etc.; secondly, we perform unconsciously things to which we have become accustomed in accordance with our especial characters. When, during my work, I rise, get a glass of water, drink it, and set the glass aside again, without having the slightest suspicion of having done so, I must agree that this was possible only in my well-known residence and environment, and that it was possible to nobody else, not so familiar. The coachman, perhaps, puts the horses into the stable, rubs them down, etc., and thinks of something else while doing so. He has performed unconsciously what another could not. . . . Such complicated processes go down to the simplest operations. Aubert indicates, for example, that in riding a horse at gallop you jump and only later observe whether you have jumped to the right or the left. The brain does not merely receive impressions unconsciously, it registers them without the coöperation of consciousness, works them over unconsciously, awakens the latent residua without the help of consciousness, and reacts like an organ endowed with organic life toward the inner stimuli which it receives from other parts of the body. This also influences the activity of the imagination.

(c) *Hallucinations and Illusions.* The limits between illusions of sense and hallucinations and illusions proper can in no sense be definitely determined inasmuch as any phenomena of the one may be applied to the other, and vice versa. Most safely it may be held that the cause of illusions of sense lies in the nature of sense organs, while the hallucinations and illusions are due to the activity of the brain. The latter are much more likely to fall within the scope of the physician than sense illusions, but at the same time many of them have to be determined upon by the lawyer, inasmuch as they really occur to normal people or to such whose disease is just beginning so that the physician cannot yet reach it. Nevertheless, whenever the lawyer finds himself face to face with a supposed illusion or hallucination he must absolutely call in the physician. . . .

Hallucination and illusion have been distinguished by the fact that hallucination implies no external object whatever, while in illusion objects are mistaken and misinterpreted. When one thing is taken for another, *e.g.* an oven for a man, the rustle of the wind for a human song, we have illusion. When no objective existence is perceived, *e.g.* when a man is seen to enter,

a voice is heard, a touch is felt, although nothing whatever has happened, we have hallucination. Illusion is a partial, hallucination is a complete, supplementation of an external object. Most human beings are from time to time subject to illusions; indeed, nobody is always sober and intelligent in all his perceptions and convictions. The luminous center of our intelligent perceptions is wrapped in a cloudy half-shadow of illusion. Sully aims to distinguish the essential nature of illusion from that characterized by ordinary language. Illusion, according to him, is often used to denote mistakes which do not imply untrue perceptions. We say a man has an illusion who thinks too much of himself, or when he tells stories otherwise than as they happen because of a weakness of memory. Illusion is every form of mistake which substitutes any direct self-evident or intuitive knowledge, whether as sense perception or as any other form.

Nowadays the cause of hallucination and illusion is sought in the over-excitement of the cerebro-spinal system. As this stimulation may be very various in its intensity and significance, from the momentary rush of blood to complete lunacy, so hallucinations and illusions may be insignificant or signs of very serious mental disturbances. When we seek the form of these phenomena, we find that all those psychical events belong to it which have not been *purposely* performed or lied about. When Brutus sees Cæsar's ghost; Macbeth, Banquo's ghost; Nicholas, his son; these are distinctly hallucinations or illusions of the same kind as those "really and truly" seen by our nurses. The stories of such people have no significance for the criminalist, but if a person has seen an entering thief, an escaping murderer, a bloody corpse, or some similar object of criminal law, and these are hallucinations like classical ghosts, then are we likely to be much deceived. Hoppe enumerates hallucinations of apparently sound (?) people. 1. A priest, tired by mental exertion, saw, while he was writing, a boy's head look over his shoulder. If he turned toward it, it disappeared; if he resumed writing, it reappeared. 2. "A thoroughly intelligent" man always was seeing a skeleton. 3. Pascal, after a heavy blow, saw a fiery abyss into which he was afraid he would fall. 4. A man who had seen an enormous fire, for a long time afterward saw flames continually. 5. Numerous cases in which criminals, especially murderers, always had their victims before their eyes. 6. Justus Möser saw well-known flowers and geometrical figures very distinctly. 7. Bonnet knows a "healthy" man who saw people, birds, etc., with open eyes. 8. A man got a wound in his left ear and for weeks afterward saw a cat. 9. A woman eighty-eight years old often saw everything covered with flowers, — otherwise she was quite "well."

A part of these stories seems considerably fictitious, a part applies to indubitable pathological cases, and certain of them are confirmed elsewhere. That murderers, particularly women murderers of children, often see their victims is well known to us criminalists. . . . Cases are told of in which prisoners who were constipated had all kinds of visual and auditory hallucinations and appeared, *e.g.*, to hear in the rustling of their straw, all sorts of words. That isolation predisposes people to such things is as well known as the fact that constipation causes a rush of blood to the head, and hence, nervous excitement. The well-known stories of robbers which are often told us by prisoners are not always the fruit of malicious invention. Probably a not insignificant portion are the result of hallucination. Hoppe

when the mistake, at least in its main characteristic, is due to the aural mechanism. The latter is intended when there is a mistake in the comprehension of a word or of a sentence. In this case the ear has acted efficiently, but the mind did not know how to handle what had been heard and so supplements it by something else in connection with matter more or less senseless. Hence, misunderstandings are so frequent with foreign words. Compare the singing of immigrant school children, "My can't three teas of tea" for "My country 'tis of thee," or "Pas de lieu Rhone que nous" with "Paddle your own canoe."

The question of misunderstandings, their development and solution, is of great importance legally, since not only witnesses but clerks and secretaries are subject to them. If they are undiscovered they lead to dangerous mistakes, and their discovery causes great trouble in getting at the correct solution. . . . The mistakes of the secretaries may in any event be reduced to a minimum if all dictations are read immediately, and not by the secretary but by the examining judge himself. If the writer reads them he makes the same mistakes, and only a very intelligent witness will perceive them and call attention to them. Unless it so happens the mistake remains. I cite a few of the errors that I have observed. From a protocol with the suspect: "On the twelfth of the month I left Marie Tomizil" (instead of, "my domicile"). Instead of "irrelevant," — "her elephant." Very often words are written in, which the dictator only says by the way; *e.g.* "come in," "go on," "hurry up," "look out," etc. If such words get into the text at all, it is difficult to puzzle out how they got in. How easily and frequently people misunderstand is shown by the oath they take. Hardly a day passes on which at least one witness does not say some absolute nonsense while repeating it.

(2) *Other Misunderstandings.* The quantitative method of modern psychophysics may lead to an exact experimental determination of such false conceptions and misunderstandings as those indicated above, but it is still too young to have any practical value. It is vitiated by the fact that it requires artificial conditions and that the results have reference to artificial conditions. Wundt has tried to simplify apparatus, and to bring experiment into connection with real life. But there is still a far cry from the psychological laboratory to the business of life. With regard to misunderstandings the case is certainly so. Most occur when we do not hear distinctly what another person is saying and supplement it with our own notions. Here the misunderstanding is in no sense linguistic, for words do not receive a false meaning. The misunderstanding lies in the failure to comprehend the sense of what we have heard, and the substitution of incorrect interpretations. . . .

How frequently and hastily we build things out is shown by a simple but psychologically important game. Ask anybody at hand how the four and the six look on his watch, and let him draw it. Everybody calmly draws, IV and VI, but if you look at your watch you will find that the four looks so, IIII, and that there is no six. This raises the involuntary question, "Now what do we see when we look at the watch if we do not see the figures?" and the further question, "Do we make such beautiful mistakes with all things?"

I assert that only that has been reliably seen which has been drawn. My

father asked my drawing teacher to teach me not to draw but to observe. And my teacher, instead of giving me copies, followed the instruction by giving me first one domino, then two, then three, one upon the other, then a match box, a book, a candlestick, etc. And even to-day, I know accurately only those objects in the household which I had drawn. Yet frequently we demand of our witnesses minutely accurate descriptions of things they had seen only once, and hastily at that.

And even if the thing has been seen frequently, local and temporal problems may make great difficulties. . . . For example, if you have traveled numerous times on the train from A to B, and for once you start your journey from C, which is beyond A, the familiar stretch from A to B looks quite different and may even become unrecognizable. The estimation of time may exercise considerable influence on such and similar local effects. . . . One needs only to observe how quickly witnesses tend to identify objects presented for identification: *e.g.* knives, letters, purses, etc. To receive for identification and to say yes, is often the work of an instant. The witness argues, quite unconsciously, in this fashion: "I have given the judge only one clew (perhaps different from the one in question), now here again is a clew, hence, it must be the one I gave him." That the matter may have changed, that there has been some confusion, that perhaps other witnesses have given similar things, is not at all considered. Here again we have to beware of confusing of identities with agreements.

Finally, we must consider fatigue and other conditions of excitation. A witness who has been subjected to a prolonged and fatiguing examination falls into a similar condition and knows at the end much less than at the beginning. Finally, he altogether misunderstands the questions put to him. The situation becomes still worse when the defendant has been so subjected to examination, and becomes involved, because of fatigue, etc., in the famous "contradictions." If "convincing contradictions" occur at the end of a long examination of a witness or a defendant, it is well to find out how long the examination took. If it took much time the contradictions mean little.

The same phenomena of fatigue may even lead to suspicion of negligence. Doctors, trained nurses, nursery maids, young mothers, etc., who became guilty of "negligence" of invalids and children have, in many instances, merely "misunderstood" because of great fatigue. It is for this reason that the numerous sad cases occur in which machine tenders, switch tenders, etc., are punished for negligence. If a man of this class, year after year, serves twenty-three hours, then rests seven hours, then serves twenty-three hours again, etc., he is inevitably overtaken by fatigue and nervous relaxation in which signals, warnings, calls, etc., are simply misunderstood.

236. G. F. ARNOLD. *Psychology applied to Legal Evidence*. (1906. p. 133.) . . . I. *Attention as an Element in Perception*. First, we shall attempt to describe psychologically in what attention consists, and this cannot be done in a few words. Attention is not a separate faculty of the mind which acts on the other psychical phenomena, but is the name given to a certain state of consciousness as a whole, and that state is one of monoidism. "The normal condition," says Ribot, "is plurality of states of consciousness or polyideism. Attention is the momentary inhibition, to the exclusive benefit of a single

state, of this perpetual progression ; it is a monoidism." . . . If you try to analyze attention further you get the following factors given by Wundt. Attention contains three essential constituents ; an increased clearness of ideas ; muscle sensations which generally belong to the same modality as the ideas, and feelings which accompany and precede the ideational change. At the same time the concept of attention proper has no reference to the first of these processes, but only to the last two. Apperception, therefore, denotes the objective change set up in ideational content, attention the subjective sensations and feelings which accompany this change or prepare the way for it. Both processes belong together as parts of a single psychological event. Attention in the wider sense is not — and this is the important point — a special activity, existing alongside of its three constituent factors, something not to be sensed or felt, but itself productive of sensation and feelings. No ! in terms of our own psychological analysis, at least, it is simply the name of the complex process which includes those three constituents. . . .

The fundamental property of the nervous system consists in the transformation of a primitive excitation into a movement. This is reflex action, the type of nervous activity. But we also know that certain excitations may impede, slacken, or suppress a movement, *e.g.* suppression of the movements of the heart through irritation of the pneumogastric nerve. This power of inhibition exists also in the brain, just as we can begin, continue, or increase a movement, we can also suppress, interrupt, or diminish it ; every act of volition, whether impulsive or inhibitory, acts only upon muscles and through muscles. The mechanism of attention is motor, and in all cases of attention there must necessarily be a play of muscular elements, real or nascent movements, upon which the power of inhibition acts. Spontaneous attention is natural and devoid of effort, and is produced by some anterior emotional state ; voluntary attention is artificial, caused by the struggle for existence and under pressure of necessity and by education. . . .

That we attend to what we are interested in is of course so universally admitted as to be almost a truism ; we only notice such items, and without selective interest our experience would be a chaos. It follows from this that *attention will vary* with the number and nature of the *interests* which observers possess. "We dissociate," says Professor James, "the elements of originally vague totals by attending to them or noticing them alternately, of course. But what determines which elements we shall attend to first ? There are two immediate and obvious answers : *first*, our practical or instinctive interests, and *secondly*, our æsthetic interests. . . . A creature which has few instinctive impulses or interests, practical or æsthetic, will dissociate few characters, and will at best have limited reasoning powers, whilst one whose interests are very varied will reason much better." Now it is often laid down as the mark of a false witness that he declines to commit himself to details on which he might be contradicted, falling back on such excuses as that he did not notice, or he does not recollect, etc., and it is not always easy to decide whether such pleas are genuine or not. The details on which he is questioned are really matters which, assuming he were a genuine witness, he might or might not be expected to have noticed according to the interests which he naturally possesses ; and it by no means follows that because one witness has observed certain details, others, if they were really

present, could have done the same, *i.e.* unless all men have the same interests. It is difficult for the judge and the advocate who are considering the matter after the event, when it has become a subject of special interest to them, to realize that before the existence of the case there was no such cause to excite the interest of the witness, and it is also difficult for them, equipped as they are with certain interests of their own, to place themselves mentally in the position of a man differently equipped, and estimate how much can reasonably be expected from him in the way of attention. . . .

Among the other determinants of attention are the strength and persistence of an impression, its suddenness, novelty, and generally its disturbing character in relation to the preëxisting state of mind. This is really again the volume and intensity of the feeling it excites, which may be bound up with the idea of past impressions and so revived along with them. . . .

The Effects of Attention. . . . It shortens reaction time and accelerates perception. . . . It is doubtful whether it actually augments the intensity of sensations, but it increases the clearness of all that we perceive or conceive, and this it does in several ways. It chooses the appropriate states and maintains them, by inhibition, within our consciousness, and so secures a certain persistence in the sensation or idea; it thus leads to its retention and so secures its reproduction (as described under the head of Memory).

Again, the concentration of attention upon some objects diminishes the intensity of presentation of others in the same field, whether the concentration be voluntary or non-voluntary; for our power of attention is limited, and if, therefore, attention is drawn off by new presentations, it must be at the expense of the old ones; if it is kept concentrated on old ones, new ones cannot gain an entrance into consciousness. It is this redistribution of attention which explains its influence on will.¹ . . . It is not uncommon to hear it given as a reason for discrediting a statement, that the witness could not possibly have seen or heard all that he professed to have been aware of, his attention being taken up at the time by this or that event, and it is a frequent saying that one cannot attend to two things at the same time. I therefore propose to say something as to the powers of attention which the ordinary individual possesses :

To understand this we must distinguish between consciousness and attention. There are various grades of consciousness, down to actual unconsciousness, but we only call it attention when the psychical content is clearly grasped and the mental state is accompanied by a special feeling; other psychical contents are merely apprehended, they are included in the field of consciousness but attention is not concentrated upon them. These latter contents come and go within the field of consciousness but do not advance to the fixation point at which we have attention. . . . Speaking roughly, therefore, a man can be *aware* of three or four times as much as he can actually *attend to*, and it is untrue that he can only attend to one impression or one idea at a time. . . .

II. *Relative Variance of Powers of Perception.* A second condition on which depends the capacity of a party to give a faithful account of things is, according to Best, "his powers, either natural or acquired, of perception and observation." . . . We rather wish to insist on the point that though

¹ J. Ward, Art. "Psychology," *Encyclopædia Britannica*, 9th ed., Vol. XX, pp. 42 *et seq.*; *Animal Magnetism*, p. 319.

each individual may be sure of his own sense perceptions, he cannot, or should not, be equally sure that others necessarily perceive as he does. Yet the attitude of the ordinary man is to accept the statements of others as to their sense perceptions only so far as what they say agrees with his own experience. It is a natural attitude, it is true; but we think it would be well to recollect the assumption on which it is founded, and to be sometimes less skeptical as to the possibility of what others say they have experienced. . . . Some individuals possess powers beyond the average. . . . Professor James has quoted a number of instances of hyperæsthesia of the senses,¹ in one of which a person was able to pick out a blank card from a pack of similar ones merely by its weight, in another a man was actually able to read the image of a page of a book reflected on the operator's cornea and to discriminate with the naked eye details in a microscopic preparation. . . .

Lastly, reference must be made to unusual powers which blind people sometimes appear to possess. Thus Mr. W. H. Levy stated that he seemed to perceive objects through the skin of his face and to have the impressions immediately transmitted to the brain. None of the five senses had anything to do with this power, and he regarded it as an unrecognized sense which he called "facial perception." By it he could distinguish shops from private houses, point out doors and windows whether they were shut or open, estimate the height of a fence and discover irregularities in height and projections and indentations in walls. Helen Keller, who lost her sight and hearing in early infancy, can recognize persons by the mere contact of their hands. . . .

We think that it has been sufficiently shown that under certain circumstances unusual powers of sensation are displayed, and that we have no grounds for limiting the possibility of their display to those particular circumstances. When therefore it is asserted on oath by an apparently respectable witness that he saw or heard or otherwise experienced something involving a display of power of the sense concerned beyond what the magistrate believes to be possible to himself or mankind in general, his statement should not be forthwith discredited as impossible. "When a supposed fact," says Best ("Evidence," § 24), "is so repugnant to the laws of nature, assumed for this purpose to be fixed and immutable, that no amount of evidence could induce us to believe it, such supposed fact is said to be impossible or physically impossible." But the laws of nature are not fixed and immutable, and such an assumption is absurd. . . .

It is not improbable that some readers may regard it as extravagant or foolish to even take into consideration such matters as hyperæsthesia, hypnotism, thought transference and the like in connection with legal evidence and the decisions of the law courts. If so, we must protest against such an attitude. . . . Sir James Stephen no doubt has advocated the method of deciding truth and falsehood according to the views held by the bulk of the community, and has on this ground justified convictions for witchcraft by juries in the past, and this is a very parallel instance. He argues that it was the duty of a jury to refuse to consider what were then the merely fanciful speculations which denied the existence of witchcraft, and in consequence of this many innocent persons were convicted, apparently

¹ James, *Psychology*, Vol. II, pp. 609-611. See also his "Essay on Psychological Research," in *The Will to Believe and Other Essays*, pp. 229 et seq.

rightly, in his opinion. In just the same way now, by a refusal to examine into the question of the existence of the unusual phenomena to which we have drawn attention, because the bulk of the community, without serious inquiry, decline to believe in them, true statements may be, and doubtless sometimes are, disbelieved and injustice is done. We are now at the stage in which those who assert the existence of such phenomena are held by the bulk of the community to indulge in fanciful speculations; but before we determine to adopt this view we may remember that in the case of witchcraft such persons proved to be right; and may therefore pause to consider whether it will not be wiser to first study what the experts have said on the subject.

237. WM. C. ROBINSON. *Forensic Oratory; a Manual for Advocates*. (1893. p. 184.) *Cross-examination; Exposure of Incorrectness in the Testimony of a Credible Witness; Incorrectness Arising from Stating Inferences as Facts*. Witnesses, like all other men, are liable to draw erroneous inferences from what they see and hear, and, having drawn them, to substitute them for the facts from which they were derived. Much of the evidence introduced in court, especially concerning promises, admissions, threats, and other spoken words, is of this character, the witness describing, not the language or events which operated on his senses, but the conclusions which he formed from them in his own mind. If undisputed, these conclusions are accepted by the jury as the facts themselves, and their judgment in the premises thus merely reflects that of the witness. Here, therefore, is a source of error which the cross-examiner should never overlook. His method of combating it is by refusing to receive the inferences of the witness, and insisting on the full disclosure of the facts on which the inference is based. . . .

Incorrectness Arising from Mistakes of Fact. Misrepresentations which arise out of mistakes as to the facts themselves are frequently discovered in the evidence. Men often think they see what they do not see, and still more often misinterpret what they hear. The physical senses, however accurate and reliable in themselves, depend for the correctness of their impressions so entirely on surrounding circumstances, that without considering these the truth of those impressions cannot be determined. Whenever, therefore, the direct examination has revealed important facts resting upon the sensations of the witness, the condition under which those sensations were experienced demand the careful scrutiny of the cross-examiner. Thus, where the witness gained his information through the sense of sight, the degree of light, the distance and position of the object, the characteristics which distinguish it from other classes of objects and from other objects of the same class, its resemblance to surrounding objects, the familiarity of the witness with it, the extent and duration of his attention to it, and many other matters bearing a similar relation to the act of vision, are necessary subjects of inquiry. The operation of the other senses demands the same kind of investigation. . . .

Want of Attention. The degree of intellectual attention with which an object was regarded is another element to be considered in determining the accuracy and completeness with which it was observed. The impressions made upon the eye and ear are not necessarily communicated to the mind. By whatever psychological hypothesis the fact may be explained, it is still true that unless the thought is fixed upon the object of sensation, the sensation

terminates with the organic sense, exciting no ideas and leaving no trace in the memory. There is a constant ratio between the mental concentration of the observer on the object, and the fullness and precision of the ideas which he obtains concerning it. . . . It is on this fact that the rule of evidence is based which gives to one affirmative witness greater weight than to many merely negative; a recognition that though in all those who were present the same physical sensations may have been experienced, yet only those would intellectually apprehend the action or event whose thought was antecedently directed to it. . . . By the same fact the wonderful variety with which the details of a transaction are described by a variety of witnesses is explained, each relating incidents which especially attracted his attention and omitting all the others.

Want of Attention: Its Causes. The degree of attention with which any given object is regarded depends in part upon the *power of mental concentration* naturally possessed by the observer, and in part upon the circumstances under which the observation itself is made. Some persons, either through a constitutional defect or from improper training, have no faculty of fixing and controlling their own thoughts. Except in the rarest instances, they never give their full attention to anything. In reading, the eye scans the printed page, but the mind constantly wanders from it. In conversation, the ear catches the words, the understanding comprehends their meaning, and the tongue replies, but all the while the current of their thoughts is flowing toward entirely different subjects. Other persons habitually bend all their energies to the work in hand. Their eyes see all that their knowledge of the attributes of things enables them to perceive. Their ears catch every sound of natural objects, every syllable and undulation of the human voice. Their senses are alive to every impression of the present moment, and what their sense perceives is communicated instantly and freely to their minds, uninterrupted by distractions, unconfused by reveries. Between these two extremes are all varieties of men, each of perceptions whose accuracy is in proportion to the attention with which he surveys the objects from which his physical sensations are derived. *The circumstances of the observer and the object*, and the relations subsisting between it and him, also affect the attention with which he regards it, and its consequent impression on his mind. The degree of mental energy of every kind depends largely on the physical condition of the man himself. Weakness, discomfort, pain of whatever character or location, destroy his power of concentration, and centralize his thoughts upon his own distress. Mental disturbance, haste, anxiety, preoccupation, or any other sensible emotion, produces the same absorption in himself and corresponding inattention to external objects. The interest or indifference of the observer toward the object, its familiarity or strangeness to him, the motive in obedience to which he directed his attention toward it, its relations to him as the sole object of attention or but one object among many equally interesting and important to him, the duration and the force of its operation on his senses, the sensations which preceded it and succeeded it, and the effort produced by these upon the one in question, — in short, every circumstance which acted at the time upon his mind or body, and by which his attention toward this one object may have been diminished or intensified, is worthy of investigation and consideration, as indicative of the degree to which the object took possession of his thoughts.

238. ARTHUR C. TRAIN. *The Prisoner at the Bar*. (2d ed. 1908. p. 224.) The probative value of all honestly given testimony depends, naturally, first, upon the witness's original capacity to observe; second, upon the extent to which his memory may have played him false; and third, upon how far he really means exactly what he says. . . .

The first consideration is how far the witness was originally capable of receiving correct impressions through his senses. Naturally this depends almost entirely upon his physical equipment and the keenness and accuracy of his general observation, both of which are usually evidenced to a considerable degree by his appearance and conduct upon the stand. . . .

Witnesses are often honestly mistaken, however, as to their own ability to observe facts, and will unhesitatingly testify that they could hear sounds and discern objects at extraordinary distances. Lawyers frequently attempt to induce aged or infirm witnesses to testify that they could hear plainly what was said by the defendant, in an ordinary tone, at a distance, say, of forty feet. The lawyer speaks in loud and distinct tones during the preliminary examination, and then gradually drops his voice to that usually employed in speaking, in the hope that the witness will ask him to repeat the question. This ruse usually fails, by reason of the fact that the lawyer, in his anxiety to show that the witness could not possibly hear the distance claimed, lowers his voice to such an extent that the test is obviously unfair.

For similar reasons counsel often call upon such witnesses to state the time by the clock which usually hangs upon the rear wall of the court room. A distinguished but conceited advocate, not long ago, after securing an unqualified statement from an octogenarian, who was bravely enduring cross-examination, that he "saw the whole thing as if it had occurred ten feet away," suddenly challenged him to tell the time by the clock referred to. The lawyer did not look around himself, as he had done so about half an hour before, when he had noticed that it was half after eleven. The old man looked at the clock and replied, after a pause, "Half-past eleven," upon which the lawyer, knowing that it must be nearly twelve, turned to the jury and burst into a derisive laugh, exclaiming sarcastically, "That is *all*," and threw himself back in his seat with an air of having finally annihilated the entire value of the witness's testimony. The distinguished practitioner, however, found himself laughing alone. Presently one of the jury chuckled, and in a trice the whole court room was in a roar at the lawyer's expense. The clock had stopped — at half-past eleven. . . .

In daily life we are quite as likely as not to be deceived by what we have seen, and this fact is so familiar to jurors that they are apt to distrust witnesses who profess to have seen much of complicated or rapidly conducted transactions. They want the main facts stated convincingly. The rest can take care of themselves. The extraordinary extent to which the complex development of modern life has dwarfed our powers of observation is noticeable nowhere more markedly than in the court-room. Things run so smoothly, transportation facilities are so perfect, specialization is carried to so high a degree, and our whole existence goes on so much indoors, that it ceases to be a matter of note or even of interest that the breakfast is properly cooked and served, that we are whisked downtown (a little matter say of five miles) in ten or twelve minutes, that we are shot up to our offices through

twenty floors in an electric elevator, that there is a blizzard or a deluge, or that part of Broadway has been blown up or a fifteen-story building fallen down. We pass days without paying the remotest attention to the weather, and forget that we have relations. Instead of walking home to supper, pausing to talk to our friends by the way, we drop into the subway, bury ourselves in newspapers, and are vomited forth almost without our knowing it at our front doorsteps. The multiplicity of detail deprives us of either the desire or the capacity to observe, and we cultivate a habit of not observing lest our eyes and brains be overwhelmed with fatigue. Observation has ceased to be necessary and has taken its place among the lost arts.

Compare the old days when a Greek could go to hear the "Œdipus," and on returning home could recount practically the whole of it from beginning to end for the benefit of the wife (who was not allowed to go herself), or even the comparatively recent period when the funeral oration over Alexander Hamilton could be reported in the "Evening Post" from memory.

SUBTITLE B: MEMORY

239. HANS GROSS. *Criminal Psychology*. (1911. transl. Kallen, § 51, p. 258.) (a) *General Theory of Memory*. In direct connection with the association of ideas is our recollection and memory, which are only next to perception in legal importance in the knowledge of the witness. Whether the witness *wants* to tell the truth is, of course, a question which depends upon other matters; but whether he *can* tell the truth depends upon perception and memory. Now the latter is a highly complicated and variously organized function which is difficult to understand, even in the daily life, and much more so when everything depends upon whether the witness has noticed anything, how, how long, what part of the impression has sunk more deeply into his mind, and in what direction his defects of memory are to be sought. It would be inexcusable in the lawyer not to think about this and to make equivalent use of all the phenomena that are presented to him. To overlook the rich literature and enormous work that has been devoted to this subject is to raise involuntarily the question, for whom was it all done? Nobody needs a thoroughgoing knowledge of the essence of memory more than the lawyer. . . .

According to Herbart and his school, memory consists in the possibility of recognizing the molecular arrangements which had been left by past impressions in the ganglion cells, and in reading them in identical fashion. According to Wundt and his pupils, the problem is one of the disposition of the central organs. And it is the opinion of James Mill that the content of recollection is not only the idea of the remembered object, but also the idea that the object had been experienced before. Both ideas together constitute the whole of that state of mind which we denote as memory. . . . When we take all these opinions concerning memory together we conclude that neither any unity nor any clear description of the matter has been attained. Ebbinghaus's sober statement may certainly be correct: "Our knowledge of memory rises almost exclusively from the observation of extreme, especially striking, cases. Whenever we ask about more special

solutions concerning the detail of what has been counted up, and their other relations of dependence, their structure, etc., there are no answers." . . .

We find in our own experience evidence of the fact that memory and the capacity to recall something often depend upon health, feeling, location, and chance associations which cannot be commanded, and happen as accidentally as anything in life can. Nobody has as yet paid attention to the simple daily events which constitute the routine of the criminalists. We find little instruction concerning them, and our difficulties as well as our mistakes are thereby increased. Even the modern repeatedly cited experimental investigations have no direct bearing upon our work.

We will content ourselves with viewing the individual conceptions of memory and recollection as occurring in particular cases and with considering them, now one, now the other, according to the requirements of the case. We shall consider the general relation of "reproduction" to memory. "Reproduction" we shall consider in a general sense and shall subsume under it also the so-called involuntary reproductions which rise in the forms and qualities of past events without being evoked, *i.e.* which rise with the help of unconscious activity through the more or less independent association of ideas. Exactly this unconscious reproduction, this apparently involuntary activity, is perhaps the most fruitful. . . .

The theories may be divided into three essential groups :

1. What is received, fades away, becomes a "trace," and is more or less overlaid by new perceptions. When these latter are ever set aside, the old trace comes into the foreground.

2. The ideas sink, darken, and disintegrate. If they receive support and intensification, they regain complete clearness.

3. The ideas crumble up, lose their parts. When anything occurs that reunites them and restores what is lost, they become whole again.

Ebbinghaus maintains, correctly enough, that not one of these explanations is universally satisfactory ; but it must be granted that now one, now another is useful in controlling this or that particular case. The processes of the destruction of an idea may be as various as those of the destruction and restoration of a building. If a building is destroyed by fire, I certainly cannot explain the image given by merely assuming that it was the victim of the hunger of time. A building which has suffered because of the sinking of the earth I shall have to image by quite other means than those I would use if it had been destroyed by water.

For the same reason when, in court, somebody asserts a sudden "occurrence," or when we want to help him and something occurs to him, we shall have to proceed in different fashion and determine our action empirically by the conditions of the moment. We shall have to go back, with the help of the witness, to the beginning of the appearance of the idea in question and study its development as far as the material permits us. In a similar manner we must make use of every possibility of explanation when we are studying the disappearance of ideas. At one point or another we shall find certain connections. One chief mistake in such reconstructive work lies in overlooking the fact that no individual is merely passive when he receives sensations ; he is bound to make use of a certain degree of activity. Locke and Bonnet have already mentioned this fact, and anybody may verify it by comparing his experiments of trying to avoid seeing or hearing, and trying

actively to see or to hear. For this reason it is foolish to ask anybody how it happened that he perceived less than another, because both have equally good senses and were able to perceive as much. On the other hand, the grade of activity each has made use of in perception is rarely inquired into, and this is the more unfortunate because memory is often proportionate to activity. If, then, we are to explain how various statements concerning contemporaneous matters, observed a long time ago, are to be combined, it will not be enough to compare the memory, sensory acuteness, and intelligence of the witnesses. The chief point of attention should be the activity which has been put in motion during the sense perception in question.

(b) *The Forms of Reproduction.* There is a series of phenomena for which we possess particular types of images which often have little to do with the things themselves. . . . Lotze shows correctly that memory never brings back a blinding flash of light, or the overpowering blow of an explosion with the intensity of the image in proper relation to the impression. . . . Maudsley points out correctly that we can have no memory of pain. . . . But one need not limit one's self to pain, but may assert that we *lack memory of all unpleasant sensations*. The first time one jumps into the water from a very high springboard, the first time one's horse rises over a hurdle, or the first time the bullets whistle past one's ear in battle, are all most unpleasant experiences, and whoever denies it is deceiving himself or his friends. But when we think of them we feel that they were not so bad, that one merely was very much afraid, etc. But this is not the case; there is simply no memory for these sensations.

This fact is of immense importance in examination. I believe that no witness has been able effectively to describe the pain caused by a body wound, the fear roused by arson, the fright at a threat, — not, indeed, because he lacked the words to do so, but because he had not sufficient memory for these impressions, and because he has nothing to-day with which to compare them. Time, naturally, in such cases makes a great difference, and if a man were to describe his experiences shortly after their uncomfortable occurrence, he would possibly remember them better than he would later on.

But these ideas may be not only voluntarily brought up; we have also a certain degree of power in *making these images clearer* and more accurate. It is rather foolish to have the examiner invite the witness to "exert his memory, to give himself the trouble, etc." This effects nothing, or something wrong. But if the examiner is willing to take the trouble, he may excite the imagination of the witness and give him the opportunity to exercise his power over the imagination. How this is done depends naturally upon the nature and education of the witness, but the judge may aid him just as the skillful teacher may aid the puzzled pupil to remember. When the pianist has completely forgotten a piece of music that he knew very well, two or three chords may lead him to explicate these chords forward or backward, and then — one step after another — he reproduces the whole piece. Of course the chords which are brought to the mind of the player must be properly chosen or the procedure is useless. . . . Whatever may especially occur to aid the memory of an event, occurs best *at the place where the event itself happened*, and, hence, one cannot too insistently advise the examination of witnesses, in important cases, only in loco rei sitæ. . . . Then the differences between what has passed, what has been later added, and what is found

to-day can be easily determined by sticking to the rule of Uphues, that the recognition of the present as present is always necessary for the eventual recognition of the past. Kant has already suggested what surprising results such an examination will give: "There are many ideas which we shall never again in our lives be conscious of, unless some occasion cause them to spring up in the memory." But such a particularly powerful occasion is locality, inasmuch as it brings into play all the influences which our senses are capable of responding to.

It is characteristic, as is popularly known, that memory can be intensified by means of special occasions. It is Höfler's opinion that the Spartan boys were whipped at the boundary stones of their country in order that they might recall their position, and even nowadays our peasants have the custom, when setting up new boundary stones, of grasping small boys by the ears and hair in order that they shall the better remember the position of the new boundary mark when, as grown men, they will be questioned about it. This being the case, it is safer to believe a witness when he can demonstrate some intensely influential event which was contemporaneous with the situation under discussion, and which reminds him of that situation.

(c) *The Peculiarities of Reproduction.* The differences in memory which men exhibit are not, among their other human qualities, the least. As is well known, this difference is expressed not only in the vigor, reliability, and promptness of their memory, but also in the field of memory, in the accompaniment of rapid prehensivity by rapid forgetfulness, or slow prehensivity and slow forgetfulness, or in the contrast between narrow, but intense memory, and broad but approximate memory.

Certain special considerations arise with regard to the field of *greatest memory*. As a rule, it may be presupposed that a memory which has developed with especial vigor in one direction has generally done this at the cost of memory in another direction. Thus, as a rule, memory for numbers and memory for names exclude each other. My father had so bad a memory for names that very frequently he could not quickly recall my Christian name, and I was his own son. Frequently he had to repeat the names of his four brothers until he hit upon mine, and that was not always a successful way. When he undertook an introduction it was always: "My honored m — m — m," — "The dear friend of my youth m — m — m." On the other hand, his memory for figures was astounding. He noted and remembered not only figures that interested him for one reason or another, but also those that had not the slightest connection with him, and that he had read merely by accident. He could recall instantaneously the population of countries and cities, and I remember that once, in the course of an accidental conversation, he mentioned the production of beetroot in a certain country for the last ten years, or the factory number of my watch that he had given me fifteen years before and had never since held in his hand.

Such various developments are numerous and of importance for us, because we frequently are unwilling to believe the witness testifying in a certain field for the reason that his memory in another field had shown itself to be unreliable. . . . These fields seem to be of a remarkably narrow extent. Besides specialists (numismatists, zoölogists, botanists, heralds, etc.) who, apart from their stupendous memory for their particular matters, appear

to have no memory for other things, there are people who can remember only rhymes, melodies, shapes, forms, titles, modes, service, relationships, etc. . . .

It is a matter of experience that the *semi-idiotic* have an excellent memory and can accurately reproduce events which are really impressive or alarming, and which have left effects upon them. Many a thing which normal people have barely noticed, or which they have set aside in their memory and have forgotten, is remembered by the semi-idiotic and reproduced. On the contrary, the latter do not remember things which normal people do, and which in the latter frequently have a disturbing influence on the important point they may be considering. Thus the semi-idiotic may be able to describe important things better than normal people. . . .

Similar experiences are yielded in the case of the memory of *children*. Children and animals live only in the present, because they have no historically organic ideas in mind. They react directly upon stimuli, without any disturbance of their idea of the past. This is valid, however, only for very small children. At a later age children make good witnesses, and a well-brought-up boy is the best witness in the world. We have only to keep in mind that later events tend in the child's mind to wipe out earlier ones of the same kind. . . . Bolton, who has made a systematic study of the memory of children, comes to the familiar conclusion that the scope of memory is measured by the child's capacity of concentrating its attention.

That *aged* persons have, as is well known, a good memory for what is long past, and a poor one for recent occurrences is not remarkable. It is to be explained by the fact that age seems to be accompanied with a decrease of energy in the brain, so that it no longer assimilates influences, and the imagination becomes dark and the judgment of facts incorrect. . . .

(d) *Illusions of Memory*. Memory illusion, or *paramnesia*, consists in the illusory opinion of having experienced, seen, or heard something, although there has been no such experience, vision, or sound. It is the more important in criminal law because it enters unobtrusively and unnoticed into the circle of observation, and not directly by means of a demonstrated mistake. Hence, it is the more difficult to discover and has a disturbing influence which makes it very hard to perceive the mistakes that have occurred in consequence of it.

Everybody is familiar with the phenomenon in which the sudden impression occurs, that what is experienced has already been met with before so that the future might be predicted. . . . Sully, in his book on illusions, has examined the problem most thoroughly and he draws simple conclusions. He finds that vivacious children often think they have experienced what is told them. This, however, is retained in the memory of the adult, who continues to think that he has actually experienced it. . . . Dickens has dealt with this dream life in "David Copperfield." Sully adds, that we also generate illusions of memory when we assign to experiences false dates, and believe ourselves to have felt, as children, something we experienced later and merely set back into our childhood.

So, again, he reduces much supposed to have been heard, to things that have been read. Novels may make such an impression that what has been read or described there appears to have been really experienced. A name or region then seems to be familiar because we have read of something similar. It will perhaps be proper not to reduce all the phenomena of param-

nesia to the same conditions. Only a limited number of them seem to be so reducible. Impressions often occur which one is inclined to attribute to illusory memory, merely to discover later that they were real but unconscious memory; the things had been actually experienced and the events had been forgotten. Aside from these unreal illusions of memory, many, if not all, others, are explicable, as Sully indicates, by the fact that something similar to what has been experienced, has been read or heard, while the fact that it has been read or heard is half forgotten or has sunk into the subconsciousness. Only the sensation has remained, not the recollection that it was read, etc. Another part of this phenomenon may possibly be explained by vivid dreams, which also leave strong impressions without leaving the memory of their having been dreams. All this may happen to anybody, well or ill, nervous or stolid. Indeed, Kräpelin asserts that paramnesia occurs only under normal circumstances. It may also be generally assumed that a certain fatigued condition of the mind or of the body renders this occurrence more likely, if it does not altogether determine it.

240. G. F. ARNOLD. *Psychology of Legal Evidence*. (1906. pp. 105, 403.) . . . In Memory there is necessarily some contrast of past and present, in Retentiveness nothing but the persistence of the old. Again, though Memory includes Recognition, Recognition as such does not include Memory in which there is also remembrance of the time and circumstance in which an impression, piece of knowledge, etc., was acquired. When we find ourselves suddenly reminded by what is happening of a preceding experience exactly like it, if we are unable to assign to such representation a place in the past, instead of a belief that it happened there arises bewilderment. We distinguish Imagination from Memory because in the former there is no Recognition, and because of the fixed order and position of the ideas of what is remembered or expected as contrasted with the liberty of the imagination to transpose and change its ideas: at the same time the machinery of memory must be largely determined by men's powers of imagining which differ greatly, as will be explained later. . . . In the present chapter, unless it seems specially called for, no precise distinction will be observed between Memory and Recognition, and Retentiveness will be treated as the basis of Memory.

A man's native *retentiveness* depends on the brain tissue, and is *unchangeable*. "No amount of culture," says Professor James, "would seem capable of modifying a man's 'general retentiveness.' This is a physiological quality, given once for all with his organization and which he can never hope to change. It differs no doubt in disease and health. . . . It is better in fresh and vigorous hours than when we are fagged or ill." At the same time retentiveness is affected in other ways, which we shall now proceed to consider as the conditions of memory.

The following are some of the *mental conditions of memory*: Firstly, as regards the circumstances of the moment of the *original appearance*, it depends on (a) the degree of impressiveness of the original experience, *i.e.* the amount of interest it awakened and of attention it excited. But (b) the absence of impressiveness may be made good by a repetition of the actual experience or by the fact of previous mnemonic revivals. Time and repetition are required for memory to be established. (c) Our state of

health and general vital power affects our ability to take in impressions. (d) The presentative element must have intensity and distinctness and also sufficient duration.

Secondly, as regards the moment of the *reappearance*: here the preëxisting mental conditions and association of ideas are the important matters. Every recollection is determined by some link of association, which may be either of contiguity or similarity, *i.e.* the original experience may have occurred at the same time or in close succession, or the sight of one place or person recalls that of another place or person. Again, a fresh and healthy brain is also required for reproduction, and we are also influenced by our emotional states, while much depends on the nature of the memories themselves. The more simple and less complex easily disappear, and those which have many strongly marked and distinctive sides are better retained. We are further aided by the recency of the occurrence and our own powers of imagination. The above is a mere summary and not intended to be exhaustive: it will be both amplified and supplemented in the course of the following pages under various heads.

No one will probably dispute that different men have different powers of memory, but the point to which we now wish to draw attention is that there are *different kinds of memory*. For we conceive that there cannot be a greater mistake than to assume that we can judge offhand of the possibility of an alleged act of remembrance, either by reference to our own powers or to a supposed average power of recollection, or again that we can be at all sure of how much any man can be reasonably expected to remember under any particular circumstances. We are aware that such estimates are confidently made by judges and advocates in spite of the statements of witnesses that they do actually recollect more or less than is supposed to be possible or reasonable; and the more we have studied memory and all that affects it, the less we feel disposed to accept the skeptical views of the law courts concerning it.

The varieties which we are about to speak of are pure *individual differences of memory*. "Idiosyncracies are frequent," says Dr. Ward, "thus we find one person has an exceptional memory for sounds, another for color, another for forms." The kinds of images employed in memory are as numerous as the different kinds of sensations, *viz.* visual, auditory, tactile, motor, etc.: we may use them singly or cumulatively, but each has his own habits and according as visual or auditory images predominate with him, he will have a good memory for sights or sounds. The indifferent kind are those in whom one type of memory is equal to another. "The statistical investigations of Mr. F. Galton," says Professor Sully, "into the nature of visual representation, or what he calls 'visualization,' go to show that this power varies greatly among individuals (of the same race), that many persons have very little ability to call up distinct mental pictures of such familiar objects as the breakfast table." It also varies with race, sex, and age. It seems to us plain that the power of recollecting a scene will depend very much on a man's power of visualization, and if one who has got this power judges one who has not, or vice versa, his estimate of the truth of the latter's statements is likely to be very erroneous, unless he has some psychological knowledge of memory. . . . We recollect to have seen it stated more than once that an uneducated villager could not possibly have

remembered all he stated in court and has clearly been taught by the police or the headman of the village or by whoever can conveniently be made the villain of the piece: we would therefore warn the reader that there are no valid grounds for attributing bad memory to uneducated persons. We do not suppose that a similar dictum would be accepted if the witness were a philosopher or a mathematician, yet it is a psychological fact that savages and uneducated persons have more powers of visualizing than persons whose interests are rather in the abstract: but there is also another reason. Where the range of interest is narrow, it is concentrated, and, as pointed out in the case of the idiot, the memory is therefore likely to be exact within the limits of observation. Good memory is partly due to the interest we take in a matter and partly mechanical, and the educated rarely have the latter kind because they have developed the former at its expense: high mental power is seldom combined with good mechanical memory. You may see sometimes how well ponies remember a road, because they do not think as they go along and so the landmarks are the only things impressed on them: the savage is a modified instance of the same kind. That he should have an excellent memory of the mechanical kind might have been suggested by the way that Homer's poems and other long epics have been handed down correctly by quite uneducated persons. As the mechanical memory depends on the juxtaposition of events in space and time as opposed to the memory which depends on intelligent interest, there is nothing surprising in the fact that a Burman villager remembers whether he went to the right or left or whether this or that person was facing north or south, for these are the kinds of questions which many advocates ask, although he may be relating events which happened long ago.

Allusion has already been made to *emotion as influencing memory*. There is a mistaken impression that fear prevents attention to what is going on and therefore hinders memory, and it has been argued before the writer more than once that a narrative or an identification is not reliable because the witness being frightened at the time could not have noticed or recollected what she states. This is a frequent incident of a dacoity or robbery case. It is well, therefore, to state exactly what the effect of fear is. It may be that the fear is so great as to totally paralyze the mind, as *e.g.* when the serpent fascinates its prey, and in such cases the argument would have foundation: but this is rarely so, and usually a person under its influence observes better and remembers clearly. Nor is this strange if we realize the character of emotion. "Fear," says Darwin, "is often preceded by astonishment, and is so far akin to it that both lead to the sense of sight and hearing being instantly aroused. It leads us to attend minutely to everything around us because we are then specially interested in them, as they are likely to intimately concern us." . . . To the same effect again Professor Sully says: "The essential element in interest is feeling, and any marked accompaniment of feeling, whether pleasurable or painful, is, as we all know, a great aid to retention. Thus the events of our early childhood which we permanently retain commonly show an accompaniment of strong feeling, more particularly perhaps that of childish wonder at something new and marvelous, whether delightful or terrible. The effect of disagreeable feeling in fixing impression is illustrated in the retention of the image of an ugly or malevolent-looking face, of words in a foreign language which have

disagreeable sensations," etc. . . . He then points out that great emotion tends to color or give a particular direction to the ideas of the time, a fact also noted by Professor James as follows: "When any strong emotional state whatever is upon us the tendency is for no images, but such as are congruous with it to come up. If others by chance offer themselves, they are instantly smothered and crowded out." There is then this danger, for it will equally affect our recollection of events. But apart from this, the effect of fear, so far from hindering recollection, is to aid it by giving exceptional vividness, distinctness, and persistence to the images called up at the time.

Exceptional memory is also displayed in certain *pathological states* which are akin to emotion, especially the hypnotic: instances are given by Binet and Féré (authors of "Animal Magnetism"), who further remark "the acuteness of the memory during somnambulism without absolutely justifying those who assert that nothing is lost to memory yet shows that its conservative power is much greater than is supposed, when measured by the capacity of reproduction or recollection. It proves that in many cases in which we believe that a certain fact is completely effaced from the memory, this is by no means the case; the trace of it is there, but the power of recalling it is wanting; and it is probable that under the influence of hypnotism or of some excitement to which we are sensitive, it would be possible to revive the apparently extinct memory of the fact in question." . . . Professor Sully's remarks on the same point also deserve quoting: "The stage of complete obliviscence is supposed to be reached when no effort of will and no available aid from suggestive forces succeed in effecting the reproduction. In order, however, to determine that a fact is thus irrecoverably forgotten, we ought first to have tried the maximum force of the reproductive agencies and this is often out of our power. The addition of the stimuli of locality, sound of voice, and so forth, might serve to recall images of persons which are now apparently irrecoverable. The remarkable revival of remote and seemingly lost impressions in dreams and in certain forms of brain derangement suggest that much which we suppose to be forgotten might, under the most favorable conjunction of conditions, be recovered." Some readers will remember that such an experiment was made in Wilkie Collins's story, "The Moonstone." We wish we had space to quote here some of the pathological evidence in question, as it would certainly convince doubters that abnormal powers of memory have been displayed under such conditions; and, if this be so, in view of the fact that we cannot, in the present state of our knowledge, define the conditions of its display, we should have more hesitation in classing as impossible what appear to be abnormal recollections under ordinary circumstances.

Nor, again, because a witness once says that he cannot recollect a person or an event, does it follow that he will *not do so afterwards under other circumstances*: according to the author's experience, as evidence is at present received, it is quite sufficient for a man to have failed once to recollect, to be instantly discredited if he subsequently professes to remember; yet the inference that he is not speaking the truth in such a case, may clearly in the light of the above facts be quite erroneous. It is not necessary, however, to appeal to pathological evidence to explain sometimes how it can be that a man may honestly recollect after stating his inability to do so; for we are often able to identify an object, as a face, when we actually

see it, without having any corresponding power of imaging it when he is absent. The lower animals which have at best only a rudimentary power of imaging, often display a marvelous power of recognizing. This important point is not sufficiently understood: it is a common practice to ask a witness to describe a person, an article of jewelry or clothing, etc., before he or it is shown to him, and, if he fails to give an accurate description beforehand, to regard it as a proof that the identification is not genuine. No doubt such a description would be a valuable confirmation of his statement; but the failure to give one may plainly be no proof of its falsity, being simply due to the lack of power to visualize, concerning which we have already spoken. In the absence of such power it is not plain how such a description could be expected, and indeed the expectation seems to betray some ignorance of the process of memory, which is also illustrated by the following examples. The writer remembers a High Court judge remarking in a dacoity case in which a woman professed to have identified one of the dacoits who was previously a stranger to her, that he did not believe her, for one reason because she had not said at the time of the dacoity that she would be able to recognize any of them: and yet had she made the statement he desired it would have been quite worthless. For in memory we only know retention through the fact of revival: what this woman perceived at the time was subsequently reproduced under the new form of an image, and the immediate conditions of the appearance of the image was the recurrence in some form of that mode of central excitation which conditioned the original impression. But this learned judge wished the poor woman to say beforehand what she would not know until the cause capable of exciting the image had been presented to her. In a second case, viz. one of kidnapping, in which a mother was testifying as to the age of her daughter, the advocate for the defense questioned her as to whether she could remember the names of any other children who were born in her village in the same year, which she could not do. Now in the first place we remember what we are interested in, and the woman was presumably not interested in the other children; but, apart from this, the cross-examination was conducted on a totally wrong principle so far as memory was concerned: for the woman's daughter was present in court, and she was thus an exciting cause to revive the impressions in the mother's brain, whereas the advocate neither produced any other woman from the village nor even mentioned her name, so that there was no reason why the witness should remember anything about any one else. He simply ignored the fact that there is needed in ordinary cases the presence of something to remind us of the object, or to suggest it to our minds. . . . To the magistrate, because there are no associations of ideas connected with these things in his mind, they cannot be identified in the absence of some distinct mark, and he has not sufficient imagination to put himself in the villager's place.

Since so much importance is usually attached to the existence of *marks as aids to memory*, we must devote a few words to this subject. Psychologically considered such marks are merely reasons for the recollection, and it seems a legitimate question. Why do we always want a reason, *i.e.* something intermediate, as an explanation of memory? If a man recognizes a coat, he must mention a mark; if he recollects a date, he must mention some approximate event to prove it, etc. But why again does not the same

feeling recur as to the mark, event, etc., and so on, ad infinitum? To understand this it is necessary to grasp the theory of association of ideas by similarity and contiguity, and the explanation of what is known as the feeling of Recognition. There are two fundamental forms of connection between ideational elements, connection by likeness, and connection by contiguity, and both are concerned in every case of actual association. There is a direct connection of like elements of different ideas, one recalls the other, and then a connection attaches itself immediately to this of such elements of previous ideas as have been externally contiguous to those like constituents: if, as we look at the total result, the connections of the like elements are predominant, we speak of a similarity association, if the external connections are the stronger, of a contiguity association.¹ In cognition the presented and the memorial elements combine at once to a single idea, referred to the actual impression, and from cognition Recognition is developed as follows. In immediate recognition we are either unconscious or but obscurely conscious of the connecting links by whose aid recognition is effected: we may be merely conscious that we have had the idea before without there being any recollection of the attendant circumstances, or, although the recognition is immediate, we may also recall the temporal relations and spatial surroundings in which we previously made the acquaintance of the recognized object. Now it is only when we consciously localize the recognized idea in time and space that we get the feeling of recognition; the act of recognition requires these contiguity connections for its completion. Immediate recognition furnishes the transition to mediate recognition, where we are clearly conscious that recognition is brought about by the mediation of secondary ideas, such as the marks, events, etc., spoken of above. On this point we will quote Wundt's words: "Think how often you meet a person whom at first sight you take to be an absolute stranger. But he tells you his name, and on a sudden the face that was so unfamiliar shows you the features of an old acquaintance. Or there may be other mediating circumstances. You see a third person whom you have often noticed in his company, and your eyes chance to fall on a coat or a traveling bag that awaken your memory. Here again there is a special feeling regularly associated with the act of recognition. This feeling comes later and arises more gradually than the immediate recognition feeling. At the same time you will find that it may be very vivid even when the apprehension of the agreement between the present idea and previous is still quite indefinite." Now Wundt's view is that in every case of recognition, mediate or immediate, secondary or auxiliary ideas are in fact employed, but in the former case they are perceived first and the agreement of the two principals afterwards, while in the latter they are perceived at the same time only as the agreement of the principals or even later: but in every instance the *feeling* of recognition depends upon the excitation of auxiliary ideas. Professor Sully gives the physiological explanation of this feeling thus: "when a particular central element or cluster of elements is reëxcited to a functional activity similar to that of a previous excitation, this new excitation is somehow modified by the residuum of its previous activity or surviving 'psychological

¹ Wundt, *Human and Animal Psychology*, pp. 296, 297. (The writer is aware that there are other explanations of association of ideas, but he cannot discuss them in a work like the present.)

disposition.' This modification is the only assignable nervous substrate of the consciousness of familiarity or recognition." The importance of marks, proximate events, etc., as auxiliary ideas producing the feeling of recognition is thus plain, and it is not necessary to go back and seek again further marks or events to confirm these, because as soon as we have by their aid consciously localized the past impression in time and space, we have got the feeling of recognition that we require and are satisfied. . . .

But we must insist that reasons for recollecting events cannot always be given, and it is dangerous to press native witnesses for them, as it only results in their inventing some transparently fictitious explanation, which tends to discredit them unnecessarily. There is nothing strange, as some advocates seem to think, in witnesses recollecting some events and not others, for our memories restore to us only fragments of our past life and often what now seems to us only insignificant details of a scene or incident. Sully says: "It seems quite impossible to account for these particular revivals, they appear to be so capricious. When a little time has elapsed after an event and the attendant circumstances fade away from memory, it is often difficult to say why we were impressed with it as we afterwards prove to have been. It is no doubt possible to see that many recollections of our childhood owe their vividness to the fact of the exceptional character of the events; but this cannot always be recognized. Some of them seem to our mature minds very oddly selected, although no doubt there are in every case good reasons, if we could only discover them, why those particular incidents rather than any others should have been retained." . . .

We have spoken above of mediate and immediate recognition, and we shall now discuss further the *relation of memory to inference*. With reference to this we should like to quote the following passage: "A witness may give the substance of conversations or writings, but he will not be permitted to say what is the impression left on him by a conversation unless he swears to such impressions as recollections and not inferences."¹ Those authors apparently hold that recollection does not involve inference, an opinion which we believe to be erroneous, as will appear in the course of this discussion. Professor Sully, speaking of immediate knowledge, says: "It will be found that even with respect to memory, when the remembered event is at all remote, the process of cognition approximates to a mediate operation, viz. one of inference." Binet after stating that there is no well-defined distinction between a perception recollection and a perception reasoning, quotes Professor Sully, that "in both cases there is a reinstatement of the past, a reproduction of earlier experience, a process of adding to a present impression, a product of imagination taking this word in its widest sense. In both cases the same laws of reproduction or association are illustrated; that is to say, an association of resemblance followed by an association of contiguity; . . . our state of mind in recognizing an object or person is commonly an alternative between these two acts of separating the mnemonic image from the percept and so recalling or recollecting the past, and fusing the image and the percept in what is specially marked off as recognition." He then proceeds: "In what respect does a recollection differ from a reasoning? This is difficult to determine. We grasp the analogies between these two acts much more easily than their differences.

¹ Ameer Ali and Woodroffe's *Indian Evidence Act*, 2d ed. p. 948.

All that the most attentive observation teaches us is that sometimes the suggested image is projected and localized in the panorama of the past, of which it appears to be a fragment, and sometimes it is referred to a present object, and throws off the character of oldness, so as to appear actual.”¹ When, therefore, we say a witness is guessing and does not really recollect, can we truly distinguish? Are not both processes alike, in following out association of ideas? . . . It would seem then that it is impossible to distinguish recollection from inference in the way desired; and any one who will swear that the impression left on him by a conversation was a recollection and not an inference, will in our opinion swear to a great deal.

But this is not our only objection to the passage in question; there appears to lie at the root of it a fallacious idea that impressions are not to be accepted as evidence because less trustworthy than statements of recollection of facts. Yet we never do under any circumstance reproduce all that has happened, and we intentionally forget much that we see and hear, for it is only by omitting some details that we can recall what we want. What memory gives us is always an impression, or, as Professor Stout calls it, a generic image: “We simply make an outline sketch, in which the salient characters of things and events and actions appear, without their individualizing details. . . . It is possible for me to recall the whole event of taking breakfast, which occupied half an hour, in the fraction of a minute, and then pass on to something else.”² It is thus idle in the sphere of memory to seek for anything better than impressions, and if we are to discredit these, we must discredit all.

There are various ways in which the *memory can be assisted*. When an actual impression cannot be repeated, its reproduction will to some extent have the same result; thus we can keep the images of remote experiences from disappearing by periodically reviving them, as when children talk with their parents about common experiences of the past. . . . Now, looked at as a revival of memory, it may be a valuable thing for witnesses to talk over their experiences with one another before giving evidence; but this aspect of it is entirely left out of account in the view which is usually taken of it. Its sole object is always taken to be to concoct together a story which each will tell consistently; if a witness admits in the box that he has talked over the matter with another witness before entering the court, he is as often as not considered unreliable merely on that account. We do not wish to maintain that no evidence is concocted, or that it is never concocted in this manner; but we do protest against such a view being invariably taken. We suggest as an alternative that talking over the occurrences beforehand may sometimes by reviving the memory render the evidence given, not less, but more reliable. . . .

It has no doubt been frequently noticed that it is easier to recall events in the order in which they occurred, and that witnesses, if left to themselves, habitually narrate occurrences in chronological order; it has always struck the writer that the method usually adopted by public prosecutors of *asking questions*, though it may be useful in excluding irrelevant matter, *is certainly calculated to hinder memory*. What may appear to be irrelevant, according to the Evidence Act, may in fact be a necessary link in the association of

¹ Binet, *Psychology of Reasoning*, p. 176.

² Stout, *Analytical Psychology*, Vol. II, pp. 184–185.

ideas of the witness, and if closely examined will often be admissible under § 6 or one of the following sections of the Act. Dr. J. Ward has explained the order of recall as follows: "In a series of associated presentations, A, B, C, D, E, such as the movements made in writing, the words of a poem learned by heart, or the simple letters of the alphabet themselves, we find that each member recalls its successor but not its predecessor. . . . B recalls C; why does not C recall B? We have seen that any reproduction at all of A or B or C depends primarily upon its having been the object of special attention so as to occupy at least momentarily the focus of consciousness. Now we can in the first instance only surmise that the order in which they are reproduced is determined by the order in which they were thus attended to when first presented." . . .

It is highly important to allow a witness *time* when giving his evidence, not merely because hurry causes him to say what he may not really intend, but because of the actual process by which we recall a forgotten thing. Professor James describes it thus: "We recollect the general subject to which the thought relates; the thing is a gap in the midst of other things. We then think over the details and from each detail there radiates lines of association forming so many tentative guesses. Many at once are seen to be irrelevant. These added associations arise independently of the will by a spontaneous process, and our will lingers over those which seem pertinent and ignores the rest. Then the accumulation of associates becomes so great that the combined tensions of their neural processes break through the bar, and the nervous wave pours into the tract which has so long been awaiting its advent."

Memoranda for the purpose of refreshing memory are of course admissible both in the English and the Indian law under certain circumstances. . . . The legal writers above quoted have this to say: "It is further to be observed that the committing of a statement to writing calls forth unavoidably a greater degree of attention than the exhibition of it *viva voce* in the way of ordinary conversation. If this be done honestly, at the time of the occurrence which forms the subject of the statement, or so soon afterwards that the incidents must have been fresh in the writer's memory, the writing is a most reliable means of preserving the truth, more reliable indeed than simple memory itself." This is somewhat loosely expressed. If it is intended to say that the writing calls forth a greater degree of attention to the occurrence itself, the statement is in the nature of a "*hysteron proteron*." For the writing does not in any way *cause* the attention, which must be prior to it, but it is the attention given which aids retention and so facilitates the subsequent commitment to writing, the writing being merely the mode of expressing the conscious thought. If, however, all that is meant is that the committing to writing calls forth greater attention *to the writing* than the speaking of the occurrence does to the speaking, this may or may not be so, we should say, according to the circumstances, but we do not quite understand either the value or the application of such a statement here. If we may conjecture, perhaps the passage was intended to assert that writing causes reflection on the occurrence, and this reflection, while the occurrence is recent, impresses it on the memory better than the mere act of speaking it. This is doubtless true; when we, so to speak, objectify anything, it involves care and attention to the process, *i.e.* here

disagreeable sensations," etc. . . . He then points out that great emotion tends to color or give a particular direction to the ideas of the time, a fact also noted by Professor James as follows: "When any strong emotional state whatever is upon us the tendency is for no images, but such as are congruous with it to come up. If others by chance offer themselves, they are instantly smothered and crowded out." There is then this danger, for it will equally affect our recollection of events. But apart from this, the effect of fear, so far from hindering recollection, is to aid it by giving exceptional vividness, distinctness, and persistence to the images called up at the time.

Exceptional memory is also displayed in certain *pathological states* which are akin to emotion, especially the hypnotic: instances are given by Binet and Féré (authors of "Animal Magnetism"), who further remark "the acuteness of the memory during somnambulism without absolutely justifying those who assert that nothing is lost to memory yet shows that its conservative power is much greater than is supposed, when measured by the capacity of reproduction or recollection. It proves that in many cases in which we believe that a certain fact is completely effaced from the memory, this is by no means the case; the trace of it is there, but the power of recalling it is wanting; and it is probable that under the influence of hypnosis or of some excitement to which we are sensitive, it would be possible to revive the apparently extinct memory of the fact in question." . . . Professor Sully's remarks on the same point also deserve quoting: "The stage of complete obliviscence is supposed to be reached when no effort of will and no available aid from suggestive forces succeed in effecting the reproduction. In order, however, to determine that a fact is thus irrecoverably forgotten, we ought first to have tried the maximum force of the reproductive agencies and this is often out of our power. The addition of the stimuli of locality, sound of voice, and so forth, might serve to recall images of persons which are now apparently irrecoverable. The remarkable revival of remote and seemingly lost impressions in dreams and in certain forms of brain derangement suggest that much which we suppose to be forgotten might, under the most favorable conjunction of conditions, be recovered." Some readers will remember that such an experiment was made in Wilkie Collins's story, "The Moonstone." We wish we had space to quote here some of the pathological evidence in question, as it would certainly convince doubters that abnormal powers of memory have been displayed under such conditions; and, if this be so, in view of the fact that we cannot, in the present state of our knowledge, define the conditions of its display, we should have more hesitation in classing as impossible what appear to be abnormal recollections under ordinary circumstances.

Nor, again, because a witness once says that he cannot recollect a person or an event, does it follow that he will *not do so afterwards under other circumstances*: according to the author's experience, as evidence is at present received, it is quite sufficient for a man to have failed once to recollect, to be instantly discredited if he subsequently professes to remember; yet the inference that he is not speaking the truth in such a case, may clearly in the light of the above facts be quite erroneous. It is not necessary, however, to appeal to pathological evidence to explain sometimes how it can be that a man may honestly recollect after stating his inability to do so; for we are often able to identify an object, as a face, when we actually

see it, without having any corresponding power of imaging it when he is absent. The lower animals which have at best only a rudimentary power of imaging, often display a marvelous power of recognizing. This important point is not sufficiently understood: it is a common practice to ask a witness to describe a person, an article of jewelry or clothing, etc., before he or it is shown to him, and, if he fails to give an accurate description beforehand, to regard it as a proof that the identification is not genuine. No doubt such a description would be a valuable confirmation of his statement; but the failure to give one may plainly be no proof of its falsity, being simply due to the lack of power to visualize, concerning which we have already spoken. In the absence of such power it is not plain how such a description could be expected, and indeed the expectation seems to betray some ignorance of the process of memory, which is also illustrated by the following examples. The writer remembers a High Court judge remarking in a dacoity case in which a woman professed to have identified one of the dacoits who was previously a stranger to her, that he did not believe her, for one reason because she had not said at the time of the dacoity that she would be able to recognize any of them: and yet had she made the statement he desired it would have been quite worthless. For in memory we only know retention through the fact of revival: what this woman perceived at the time was subsequently reproduced under the new form of an image, and the immediate conditions of the appearance of the image was the recurrence in some form of that mode of central excitation which conditioned the original impression. But this learned judge wished the poor woman to say beforehand what she would not know until the cause capable of exciting the image had been presented to her. In a second case, viz. one of kidnapping, in which a mother was testifying as to the age of her daughter, the advocate for the defense questioned her as to whether she could remember the names of any other children who were born in her village in the same year, which she could not do. Now in the first place we remember what we are interested in, and the woman was presumably not interested in the other children; but, apart from this, the cross-examination was conducted on a totally wrong principle so far as memory was concerned: for the woman's daughter was present in court, and she was thus an exciting cause to revive the impressions in the mother's brain, whereas the advocate neither produced any other woman from the village nor even mentioned her name, so that there was no reason why the witness should remember anything about any one else. He simply ignored the fact that there is needed in ordinary cases the presence of something to remind us of the object, or to suggest it to our minds. . . . To the magistrate, because there are no associations of ideas connected with these things in his mind, they cannot be identified in the absence of some distinct mark, and he has not sufficient imagination to put himself in the villager's place.

Since so much importance is usually attached to the existence of *marks as aids to memory*, we must devote a few words to this subject. Psychologically considered such marks are merely reasons for the recollection, and it seems a legitimate question. Why do we always want a reason, *i.e.* something intermediate, as an explanation of memory? If a man recognizes a coat, he must mention a mark; if he recollects a date, he must mention some approximate event to prove it, etc. But why again does not the same

that I had dealings with the other person about the same time. Similarly, when we manage to join an event to a wrong place, we may find it is because we heard of the occurrence when staying at the particular locality, or in some other way had the image of the place closely associated in our minds with the event. But often we are wholly unable to explain the displacement."¹ Such fallacies depend on the adulteration of pure observation with inference and conjecture. There are others due to a rather different cause, which has been termed, by Professor Stout, coalescence. Coalescence or overlapping is where an old combination or new combination is relatively so powerful as to overbear the tendency opposed to it without a struggle. . . . The gradual transformation of a story as it passes from one person to another is in part due to coalescence. Each hearer unconsciously modifies it according to his preconceived ideas and transmits it to his neighbors with this added modification.² It is of course largely to guard against this that hearsay evidence is prohibited in law. Professor James describes this as one great source of the fallibility of testimony meant to be quite honest: "The most frequent source of false memory is the accounts we give to others of our experience. Such accounts we almost always make both more simple and more interesting than the truth. We quote what we should have said or done rather than what we really said or did; and in the first telling we may be fully aware of the distinction. But ere long the fiction expels the reality from memory and reigns in its stead alone."

Enough perhaps has been now said to make clear the chief sources of error in memory and what in consequence must be looked for in weighing evidence.

241. F. W. COLEGROVE. *Memory: An Inductive Study*. (1900. p. 264.) Many helpful pedagogical suggestions were received from high school, normal, and college students in reply to question 11 [in a list of inquiries made on the subject of Memory].

"Question 11. Describe fully any aids to memory which you have found useful. How do you fix in mind and recall (a) figures, dates, dimensions; (b) forms of faces, microscopic structures, leaves, crystals, patterns, figures on the wall, carpet, or dress, phrases in music, and the cut of the dresses? (c) How do you fix and recall passages of prose and poetry, declamations, and recitations? Why and how do you memorize fine passages? In learning foreign languages, describe devices for fixing new forms and phrases. Describe your system of keeping appointments. What memorandum do you keep, what book is used, and how do you make entries? As a student, how full notes do you take in the classroom? How would you teach a boy to remember things on time? Do you store up facts and dates, with no definite idea of how you will use them?" [Among the replies may be noted the following:]

Figures are mentally represented as clearly as possible, — a "picture of them as they look printed or written." A child thought of the figures to be carried in division as "gone up in the attic"; he would "call up attic to see if anything was there." One "locates them on a certain page of a book." Several "write them a few times." Three visualize in colored terms. Female, age 19, recalls the letter A as black on a red background. Female,

¹ Sully, *Illusions*, p. 266.

² Stout, *Analytical Psychology*, Vol. I, pp. 286-287.

age 21: "Words seemed colored. My name is red, my sister's is yellow. I often remember by color." Male, age 18: "I remember figures by color." Association helps; a college student writes: "I associate figures with what is familiar. If I hear that Mr. A. receives \$5000 salary, I say to myself that is five times as much as my old school teacher got. After this the salary is easily recalled." Place-localization, and association, are chiefly relied upon. Some have a kind of mnemonic system, and group or reverse the numbers. One associates the figure 8 with a doughnut. Faces are recalled by types. After fixing the type to which it belongs, the eyes, hair, nose, cheek bones, complexion, and scars are noted. A college student writes: "I try to trace a resemblance between a strange face and one I know." A middle-aged woman takes careful notice of the hand; she has a poor memory for faces, but can often locate the person by the hand. A normal student writes the initial of the person or place on the left hand; after it has been erased, she still visualizes it there. One analyzes the features; "if any feature resembles a well-known face, it is easily recalled." . . . Phrases in music are recalled by playing, or by attempting to play, or by humming the tune. College student, m., age 22: "I recall the time intervals and note the first part of the theme; I recall the rest by association." Female, age 17, normal student: "I remember phrases in music by thinking if they are similar to phrases in any selections that I have heard." . . . It is worthy of note that some excellent musicians recall music better after an interval. They cannot immediately reproduce it, if they have enjoyed it intensely. Sometimes an interval of a day or two is necessary in order to recall it well. It is quite possible that there is a modification of the basilar membrane which serves as a basis for subsequent recall.

Furthermore, it is true that many people find that a time interval is necessary to recall well any experience. E. C., f., age 17, recalls better now what happened in all school grades than when she was younger. Male, age 20: "I can define and locate my former experiences better now than I could a year or so after they happened." Female, age 19: "I can recall now things that happened 8 or 10 years ago, which I could not recall 4 years ago." Apart from a maturer mind, perspective seems to be necessary to many in order that they may have a good memory. . . .

Passages of prose and declamations are memorized by paying attention to the thought. After the thought is fixed, it easily clothes itself in language. Not a few, however, memorize mechanically, attention being paid especially to the beginnings and endings of sentences. Repetition and reading aloud are frequently mentioned. Clear mental representation and a purely local memory are of service. Male, 17: "I usually memorize by imprinting the object and its surroundings on my mind like a negative. In memorizing Lew Wallace's 'Chariot Race,' comprising 16 pages, I read it through twelve times. I imprinted the photograph of the page on my mind, and then read what I saw." . . .

A large number of devices are given for keeping appointments. Females change rings, insert paper under a ring, pin paper on dress, etc. There are other favorite mechanical devices. Chairs are turned over, and other furniture disarranged. A middle-aged man hid his hat to remind him of an appointment. Next morning he hunted up another hat, but did not recall

why the one usually worn was gone. One associates appointments with the hands of the clock at the hour fixed. Not a few find it necessary to repeat the appointment again and again. Others are aided by a memorandum. As a rule those who say their memories are utterly untrustworthy do not use notes. Yet W., m., age 26, writes that the only appointment he has missed for years is one which he noted down. Female, age 16, writes: "To keep an appointment I write the first letter of the person or place connected with the appointment on my left hand. Even if it be erased, I still imagine it there." Clear mental representation is the great help in such cases.

There is a wide diversity of opinion as to how full notes a student should take, and almost all degrees of copiousness are indicated. Female, age 37, believes her memory was injured by taking full notes at the normal school. Again, "too many notes make the general idea of the lecture indistinct." One writes that the state of his health determines how full notes he takes; if the physical tone is low, he is obliged to take more copious notes. Some are best aided by jotting down the headings and by giving attention unreservedly to the lecture. A normal student writes out very full notes, and never thinks of the contents of the lecture until she leaves the lecture room. Some take "key" words with which the rest is associated. Concentration of attention and "hand and arm" memory are acquired as a rule by taking quite copious notes. To take few notes is a work of art, and the essentials must be seized upon. The consensus of opinions received would seem to favor few notes. Where full notes are taken, they are not often reviewed. . . .

The request made under heading 13 of the syllabus called forth a wealth of material. "13. Describe cases of exceptional forgetfulness in old and young, stating whether it was due to distraction, abstraction, loss of mental power, or heredity. As a rule, does defect in memory in children appear in the field of things done, known, or felt?" Certain cases due to abstraction are as follows: A young lady went to telegraph for an umbrella left on a car; she had been holding it over her head for thirty minutes. A lady walked into the parlor with a \$10 bill in one hand, a match in the other; she put the bill in the stove and saved the match. A college professor forgets to eat his meals. A boy broke his ribs, and forgot all about it in two days. A man picked up a pebble and put it in his pocket; took out his watch and threw it into the ocean. A lady tried to tie her horse with the blanket and cover him with the line. A boy returned from the store three times to find out what his mother wanted. A lady who was called away by an important message, before breakfast, forgot until late in the day that she had eaten neither breakfast nor dinner. A gentleman, age 50, came down from his study and asked his wife if she knew where his pen was; he thought the children had mislaid it; she told him if he would take it out of his mouth, he would talk more plainly. A boy, age 9, sent to store for extract of peppermint, brought paregoric; sent back with a bottle labeled peppermint, brought vanilla; third time sent he brought the peppermint. A college professor, expert in numbers, is frequently seen with one black and one tan shoe on. A minister became absorbed in a book and forgot that it was Sunday. A man walked home and left his horse in the village all night. The same man drove home from church and left his wife.

A great share of cases of lack of memory are due to abstraction, or to absent-mindedness, which Mach terms "present-mindedness." It often characterizes people of great ability along narrow lines of thought. The following is an instance of lack of memory due to fatigue: Female, age 22: "At the age of 16 I had been traveling all day; I went to the ticket office at the last change of cars, but could not think where I was going; yet I had lived in the town sixteen years." There are a few instances given in which loss of memory is due to distraction. A middle-aged woman heard of her son's death by drowning; she could not remember her husband's address in order to telegraph him, although she had written there hundreds of times. "Aunt recalls nothing that happens since her husband's death." Defective memory in children is ascribed to things known. There are many instances reported in which forgetting occurred in the field of things done; many of these cases, however, are evidently cases of temporary forgetfulness due to abstraction. All of the Indians, with a single exception, state that things known are most easily forgotten. As to abstraction, no period of life is free from its influence. Not a few draw comfort from the facts, frequently cited, that Samuel Johnson when he had stepped from the sidewalk would continue for a long distance with one foot in the gutter and one on the walk; that Pestalozzi did not know enough to put up his umbrella when it rained; that Sir Isaac Newton supposed he had eaten when he saw the chicken bones on his plate; and that Edison forgot his wedding day. The fact is that no period of life is free from noticeable abstraction. The boy with book in hand forgets to go to dinner after he has rung the bell; the young woman goes to different parts of the house, she knows not why; middle age hunts for the thimble on its finger, or the pen in its mouth; while old age is troubled that it cannot find the glasses on its nose.

242. WM. C. ROBINSON. *Forensic Oratory; a Manual for Advocates*. (1893. p. 193.) . . . It is not easy to define in what a faithful memory consists. Some persons are endowed with excellent general memories, recalling the minutest details of events or conversations after the lapse of many years. Others remember with precision and completeness only certain classes of facts, — localities, dates, faces, names, or abstract processes of thought. Still others are without distinct recollections of any kind, their memories apparently preserving some faint, uncertain traces of almost every incident of their whole lives, but with no clear and definite impression in regard to any. In persons of the first description, the memory may always be considered good. In persons of the second, it is good whenever the thing remembered is of that class which their memories are accustomed to preserve, and bad, at least for all the purposes of evidence, when the fact belongs to that class which their memories do not retain. In persons of the third description, the memory is always bad, and on their uncorroborated evidence no question of importance ought to be decided. Were these distinctions generally understood, or if understood, were they remembered and considered by the jury, the cross-examination as a test of memory should properly be limited to the power of the witness to retain impressions concerning the class of objects to which the evidence relates. When the inquiry is as to the identity of persons, the ability of the witness to distinguish and remember faces, forms, and voices is the only faculty in question, and

whether or not localities and dates are easily recollected by him is of no consequence whatever. In actual practice, however, the law permits the jury to infer a general want of recollection from a special one, and the cross-examiner to expose defects in memory by testing it with facts of any class that he desires.

Defective Memory: how Detected. The direct examination of the witness in most instances informs the advocate as to the true condition of his memory. If he speaks positively and exhaustively concerning one class of facts, and hesitatingly or inaccurately concerning others, it may well be concluded where his weakness lies, and with what questions it may best be tested and exposed. If it be generally deficient, the whole field of the past is open to the advocate, and the more varied and disassociated are the topics it embraces, the more thoroughly are his defects revealed. On the other hand, if his memory appears generally perfect, and able to recall events of every kind with equal ease, the cross-examiner must discover a deficiency in reference to some class of facts as yet unnoticed, or his attempt will but corroborate the credibility it was intended to destroy. The tests applied to the memory of a witness by the cross-examiner must be fully and immediately apparent, as such, to the jury. If the subject he employs is not one which the jury realize that they themselves would easily remember, the failure of the witness to recall it will create no surprise. If it is so far outside of their sphere of information that, when he misremembers, or, not remembering at all, invents, they do not instantly detect him, they can draw no conclusion as to the strength or weakness of his memory. These tests must, therefore, be such as the jury are conscious that they could endure, and also such as they can see that the witness does not successfully sustain. Questions relating to important epochs in the life of the witness, to such facts in the cause as, if he tells the truth in reference to his knowledge of them, must have impressed him deeply, to those public events of which no man can be ignorant, to any striking occurrences in the court room during the trial of the cause, to matters fully demonstrated in his presence by the testimony of preceding witnesses, or to objects to which the attention of the witness is directed and which after a few moments he may be requested to describe, answer these two requisites. With an honest witness this method of examination is short and easy; with a cunning and dishonest witness its success depends mainly on the judgment with which the subject for these tests has been selected.

243. ARTHUR C. TRAIN. *The Prisoner at the Bar*. (2d ed. 1908. p. 228.) Almost all cases are stronger in court than they give the impression of being when the witnesses are first examined in the private office. . . .

The reason is not far to seek. Witnesses to the events leading up to a crime are acquainted with a thousand details which are as vivid, and probably more vivid, to them than the occurrence in regard to which their testimony is actually desired. It may well be that the immaterial facts are the only ones which have interested them at all, while their knowledge of the criminal act is relatively slight. For example, they *know*, of course, that they were in the saloon; are *positive* that the complainant and defendant were playing cards, even remembering some of the hands dealt; are *sure* that the complainant arose and walked away; *have a very vivid*

recollection that in a few moments the defendant got up and followed him across the room; are *pretty clear*, although their attention was still upon the game, that the two men had an argument; and *have a strong impression* that the defendant hit the complainant. In point of fact, their evidence is really of far *less* value, if of any at all, in regard to the *actual striking* than in regard to the events leading up to it, for at the time of the blow their attention was being given less to the participants in the quarrel than to something else. Their ideas are in truth very hazy as to the latter part of the transaction. However, they become witnesses, pronouncing themselves ready to swear that they saw the blow struck, which is perhaps the fact. Their evidence is practically of no value on the question of justification or self-defense. But finding, on being examined, that their testimony is wanted principally on that aspect of the case, they naturally tell their entire story as if they were as clear in their own minds upon one part of it as another. Being able to give details as to the earlier aspect of the quarrel, they feel obliged to be equally definite as to all of it. If they have an idea that the striking was without excuse, they gradually imagine details to fit their point of view. This is done quite unconsciously. Before long they are as glib with their description of the assault as they are about the game of cards. They get hazy on what occurred before, and overwhelmingly positive as to what occurred towards and at the last, and on the witness stand swear convincingly that they *saw* the defendant strike the complainant, exactly how he did it, the words he said, and that the complainant made no offer of any sort to strike the defendant. From allowing their minds to dwell on their own conception of what *must* have occurred, they are soon convinced that it *did* occur in that way, and their account flows forth with a circumstantiality that carries with it an irresistible impression of veracity.

The witness remembers in a large proportion of cases what he *wants* to remember, or believes occurred. The liar with his prepared lie is far less dangerous than the honest, but mistaken witness, or the witness who draws inadvertently upon his imagination. Most juries instinctively know a liar when they see and hear one, but few of them can determine in the case of an honestly intentioned witness how much of his evidence should be discarded as unreliable, and how much accepted as true.

The greatest difficulty in the trial of jury cases so far as the evidence is concerned lies in the fallibility of the human mind, and not in the inventive genius of the devil. An old man who combines a venerable appearance with a failing memory is the witness most to be feared by either side.

Both men and women habitually testify to facts as actually occurring on a specific occasion because they occurred on most occasions: Q. "*Did your husband lock the door?*" A. "Of course he did." Q. "How do you know?" A. "He *always* locks the door."

Witness after witness will take the stand and testify positively that certain events took place, or certain acts were done, when in point of fact all they can really swear to is that they usually took place or usually were done: Q. "Did he put on his hat?" A. "Certainly he did." Q. "Did you *see* him?" A. "No, but he *must* have put on his hat *if he went out*."

And the probability is that the whole question to be determined was whether or not "*he*" *did go out* or stay in.

The layman chancing to listen to a criminal trial finds himself gasping with

astonishment at the deluge of minute facts which pour from the witnesses' mouths in regard to the happenings of some particular day a year or so before. He knows that it is humanly impossible actually to *remember* any such facts, even had they occurred the day before yesterday. He may ask himself what he did that very morning and be unable to give any satisfactory reply. And yet the jury believe this testimony, and because the witness swears to it it goes upon the record as evidence of actual knowledge. In ninety-nine cases out of a hundred, counsel's only recourse is to argue to the jury that such a memory is impossible. But in the same proportion of cases the jury will take the oath of the witness against the lawyer's reasoning and their own common sense. This is because of the fictitious value given to the witness's oath by talesmen who attach little significance to their own. "He *swears* to it," says the jurymen, rubbing his forehead. "Well, he *must* remember it or he wouldn't swear to it!" And the witness probably thinks he *does* remember it. . . .

SUBTITLE C: NARRATION

244. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹ The third element forming an essential part of all testimony (*ante*, No. 163) is the process of laying before the tribunal the witness's results of his Observation or Perception, and his Recollection, *i.e.* the process of Narration or Communication. In this element, as in the other two, there are many opportunities for defects fatal to testimonial trustworthiness. As with the elements of Perception and of Recollection, so here also, experience has shown that certain dangers are to be looked for, and that certain restrictions should be imposed in order to prevent them. What these dangers and defects are depends upon the specific virtue which this element of Narration or Communication ought to possess.

Its office is to make intelligible to the tribunal the knowledge and recollection of the witness, whatever that may amount to, affirmative or negative, useful or trivial. Its prime and essential virtue, then, consists in *accurately reproducing and expressing the actual and sincere Recollection*. Assuming that the witness's Recollection fairly represents and corresponds to his Perception; then, if his Narration or Communication fairly represents and corresponds to his Recollection, and is intelligible by the tribunal, the elements of testimonial value are complete; but not otherwise. So far as the statement is found plainly or probably lacking in either of these respects, namely, in correspondence to recollected knowledge or in intelligibility, then its value diminishes accordingly. Most of the usual defects occur in the former respect, *i.e.* an absence, actual or probable, of this correspondence between the witness's uttered statement and his conscious recollection which he ought to be stating. In the other respect, *i.e.* intelligibility to the tribunal of the witness's utterance, comparatively few questions arise.

The *simplest* form of testimonial statement (from which others may be conceived of as deviations) is an (1) uninterrupted narrative (2) expressed in words (3) uttered orally (4) and intelligible directly by the tribunal. In

¹[Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, § 766.)]

any one of these features, there may be a variation from this simple and natural type; the inquiry therefore concerns not only the inherent dangers of this simplest form, but also the added ones introduced by a variance in one or another of the four respects. That is to say, testimony may be (1) furnished upon systematic *interrogations*, and not as a spontaneous utterance; or (2) it may be non-verbal, *i.e.* expressed *dramatically*, in conduct or gestures; or (3) it may be furnished in *writing*, not orally; or, finally, (4) its language may require *interpretation*, before it becomes intelligible to the tribunal.

Topic 1. Language and Demeanor as a Means of Expression

245. WILLIAM JAMES. *The Principles of Psychology*. (1889. Vol. I, pp. 37, 53.) . . . One of the most instructive proofs of motor localization in the cortex is that furnished by the disease now called aphemia, or *motor aphasia*. Motor aphasia is neither loss of voice nor paralysis of the tongue or lips. The patient's voice is as strong as ever, and all the innervations of his hypoglossal and facial nerves, except those necessary for speaking, may go on perfectly well. He can laugh and cry, and even sing; but he either is unable to utter any words at all; or a few meaningless stock phrases form his only speech; or else he speaks incoherently and confusedly, mispronouncing, misplacing, and misusing his words in various degrees. Sometimes his speech is a mere broth of unintelligible syllables. In cases of pure motor aphasia the patient recognizes his mistakes and suffers acutely from them. Now whenever a patient dies in such a condition as this, and an examination of his brain is permitted, it is found that the lowest frontal gyrus is the seat of injury. Broca first noticed this fact in 1861 and since then the gyrus has gone by the name of Broca's convolution. The injury in right-handed people is found on the left hemisphere, and in left-handed people on the right hemisphere. Most people, in fact, are left-brained, that is, all their delicate and specialized movements are handed over to the charge of the left hemisphere. The ordinary right-handedness for such movements is only a consequence of that fact, a consequence which shows outwardly on account of that extensive decussation of the fibers whereby most of those from the left hemisphere pass to the right half of the body only. But the left-brainedness might exist in equal measure and not show outwardly. This would happen wherever organs on *both* sides of the body could be governed by the left hemisphere; and just such a case seems offered by the vocal organs, in that highly delicate and special motor service which we call speech. Either hemisphere *can* innervate them bilaterally, just as either seems able to innervate bilaterally the muscles of the trunk, ribs, and diaphragm. Of the special movements of speech, however, it would appear (from the facts of aphasia) that the left hemisphere in most persons habitually takes exclusive charge. With that hemisphere thrown out of gear, speech is undone; even though the opposite hemisphere still be there for the performance of less specialized acts, such as the various movements required in eating. . . .

In man the temporal lobe is unquestionably the seat of the hearing function, and the superior convolution adjacent to the sylvian fissure is its most important part. The phenomena of aphasia show this. We studied motor aphasia a few pages back; we must now consider *sensory aphasia*. Our knowledge of this disease has had three stages: we may talk of the

period of Broca, the period of Wernicke, and the period of Charcot. What Broca's discovery was we have seen. Wernicke was the first to discriminate those cases in which the patient cannot even understand speech from those in which he can understand, only not talk; and to ascribe the former condition to lesion of the temporal lobe. The condition in question is *word deafness*, and the disease is *auditory aphasia*. The latest statistical survey of the subject is that by Dr. Allen Starr. In the seven cases of pure word deafness which he has collected, cases in which the patient could read, talk, and write, but not understand what was said to him, the lesion was limited to the first and second temporal convolutions in their posterior two thirds. The lesion (in right-handed, *i.e.* left-brained, persons) is always on the left side, like the lesion in motor aphasia. Crude hearing would not be abolished, even were the left center for it utterly destroyed; the right center would still provide for that. But the *linguistic use* of hearing appears bound up with the integrity of the left center more or less exclusively. Here it must be that words heard enter into association with the things which they represent, on the one hand, and with the movements necessary for pronouncing them, on the other. In a large majority of Dr. Starr's fifty cases, the power either to name objects or to talk coherently was impaired. This shows that in most of us (as Wernicke said) speech must go on from auditory cues; that is, it must be that our ideas do not innervate our motor centers directly, but only after first arousing the mental sound of the words. This is the immediate stimulus to articulation; and where the possibility of this is abolished by the destruction of its usual channel in the left temporal lobe, the articulation must suffer. . . .

It is the minuter analysis of the facts in the light of such individual differences as these which constitute Charcot's contribution towards clearing up the subject. Every namable thing, act, or relation has numerous properties, qualities, or aspects. In our minds the properties of each thing, together with its name, form an associated group. If different parts of the brain are severally concerned with the several properties, and a farther part with the hearing, and still another with the uttering, of the name, there must inevitably be brought about (through the law of association which we shall later study) such a dynamic connection amongst all these brain parts that the activity of any one of them will be likely to awaken the activity of all the rest. When we are talking as we think, the *ultimate* process is that of utterance. If the brain part for *that* be injured, speech is impossible or disorderly, even though all the other brain parts be intact: and this is just the condition of things which we found to be brought about by limited lesion of the left inferior frontal convolution. But back of that last act various orders of succession are possible in the associations of a talking man's ideas. The more usual order seems to be from the tactile, visual, or other properties of the things thought about to the sound of their names, and then to the latter's utterance. But if in a certain individual the thought of the *look* of an object or of the look of its printed name be the process which habitually precedes articulation, then the loss of the *hearing* center will pro tanto not affect that individual's speech. He will be mentally deaf, *i.e.* his understanding of speech will suffer, but he will not be aphasic. In this way it is possible to explain the seven cases of pure word deafness which figure in Dr. Starr's table. . . .

Thus, *there is no "center of Speech" in the brain any more than there is a faculty of Speech in the mind. The entire brain, more or less, is at work in a man who uses language.*

246. WM. D. WHITNEY. *Oriental and Linguistic Studies* (1873. p. 353); and *Language and the Study of Language* (1869. pp. 405, 102). . . . That men have willed language, as language, into existence, or, in its production, have labored consciously for the enrichment of their mental working, we do not believe. The first man who, on being attacked by a wolf, seized a club or a stone and with it crushed his adversary's head, was not conscious that he was commencing a series of acts which would lead finally to rifles and engine, would make man the master (comparatively speaking) instead of the slave of nature, would call out and train some of his noblest powers, and be an essential element in his advancement to culture. He knew nothing either of the laws of association and the creative forces in his own mind that prompted the act, or of the laws of matter which made the weapon accomplish what his fist alone could not. The psychologist and the physicist, between them, can trace out now and state with exactness those laws and forces; can formulate the perceptions and apperceptions and reflex actions on the one hand; can put in terms of *a* and *b* and *x* and *y* the additional power conferred, on the other hand; and can even maintain, as we infer, that those laws and forces and formulas produced the man's act; while all that he himself knew was that he was defending himself in a sudden emergency. . . .

Our view of the history of origination and development of language is closely akin with what we have just laid down respecting that of mechanical invention. Men have not, in truth, produced language reflectively, or even with consciousness of what they were doing; they do not, in general, even so use it after it is produced. The great majority of the human race have no more idea that they are in the habit of "using language" than M. Jourdain had that he "spoke prose"; all they know is that they can and do talk. That is to say, language exists to them for the purpose of communication simply; of its value to the operations of their own minds, of its importance as an element in human culture, of its wonderful intricacy and regularity of structure, nay, even of the distinction of the parts of speech, they have not so much as a faint conception, and would stare in stupid astonishment if you set it forth to them.

And we claim that all the other uses and values of language come as *unforeseen consequences* of its use as a means of communication. The desire of communication is a real living force, to the impelling action of which every human being, in every stage of culture, is accessible; and, so far as we can see, it is the only force that was equal to initiating the process of language making, as it is also the one that has kept up the process to the present time. It works both consciously and unconsciously; consciously, as regards the immediate end to be attained; unconsciously, as regards the further consequences of the act. When two men of different speech meet, they fall to trying simply to understand one another; so far as this goes, they know well enough what they are about; that they are thus making language they do not know; that is to say, they do not think of it in that light. The man who

beckons to his friend across a crowded room, or coughs, or *hems* to attract his attention, commits, consciously and yet unconsciously, a rude and rudimentary act of language making — one analogous doubtless with innumerable acts that preceded the successful initiation of the spoken speech which we have. No one consciously makes language, save he who uses it most reflectively. . . . And so men have gone on from the beginning, always finding a sign for the next idea, stereotyping the conception by a word, and working with it till the call for another came; and the result, at any stage of the process, is the language of that stage. . . .

Language, then, is the spoken means whereby thought is communicated, and it is only that. Language is not thought, nor is thought language; nor is there a mysterious and indissoluble connection between the two, as there is between soul and body, so that the one cannot exist and manifest itself without the other. There can hardly be a greater and more pernicious error, in linguistics or in metaphysics, than the doctrine that language and thought are identical. It is, unfortunately, an error often committed, both by linguists and by metaphysicians. "Man speaks because he thinks" is the dictum out of which more than one scholar has proceeded to develop his system of linguistic philosophy. . . .

That thought and speech are not the same is a direct and necessary inference, I believe, from more than one of the truths respecting language which our discussions have already established; but the high importance attaching to a right understanding of the point will justify us in a brief review of those truths in their application to it. In the first place, we have often had our attention directed to the *imperfection of language* as a full representation of thought. Words and phrases are but the skeleton of expression, hints of meaning, light touches of a skillful sketcher's pencil, to which the appreciative sense and sympathetic mind must supply the filling up and coloring. Our own mental acts and states we can review in our consciousness in minute detail, but we can never perfectly disclose them to another by speech; nor will words alone, with whatever sincerity and candor they may be uttered, put us in possession of another's consciousness. In anything but the most objective scientific description, or the driest reasoning on subjects the most plain and obvious, we want more or less knowledge of the individuality of the speaker or writer, ere we can understand him intimately; his style of thought and sentiment must be gathered from the totality of our intercourse with him, to make us sure that we penetrate to the central meaning of any word he utters; and such study may enable us to find deeper and deeper significance in expressions that once seemed trivial or commonplace. A look or tone often sheds more light upon character or intent than a flood of words could do. Humor, banter, irony are illustrations of what tone, or style, or perceived incongruity can accomplish in the way of impressing upon words a different meaning from that which they of themselves would wear.

That language is impotent to express our feelings, though often, perhaps, pleaded as a form merely, is also a frequent genuine experience. Nor is it for our feelings alone that the ordinary conventional phrases, weakened in their force by insincere and hyperbolical use, are found insufficient: apprehensions, distinctions, opinions, of every kind, elude our efforts at description, definition, intimation. How often must we labor, by painful

circumlocution, by gradual approach and limitation, to place before the minds of others a conception which is clearly present to our own consciousness! How often, when we have the expression nearly complete, we miss a single word that we need, and must search for it, in our memories or our dictionaries, perhaps not finding it in either! How different is the capacity of ready and distinct expression in men whose power of thought is not unlike! . . . How often we understand what one says better than he himself says it, and correct his expression, to his own gratification and acceptance. And if all the resources of expression are not equally at the command of all men of equal mental force and training, so neither are they, at their best, adequate to the wealth of conception of him who wields them; that would be but a poorly stored and infertile mind which did not sometimes feel the limited capacity of language, and long for fuller means of expression. . . .

Moreover, there is no internal and necessary connection between a word and the idea designated by it, no tie save a mental association binds the two together. Conventional usage, the mutual understanding of speakers and hearers, allots to each vocable its significance, and the same authority which makes is able to change, and to change as it will, in whatever way, and to whatever extent. . . .

Hence the impossibility that one should ever apprehend with absolute truth what another, even with the nicest use of language, endeavors to communicate to him. This incapacity of speech to reveal all that the mind contains meets us at every point. The soul of each man is a mystery which no other man can fathom: the most perfect system of signs, the most richly developed language, leads only to a partial comprehension, a mutual intelligence, whose degree of completeness depends upon the nature of the subject treated, and the acquaintance of the hearer with the mental and moral character of the speaker.

247. WM. C. ROBINSON. *Forensic Oratory, a Manual for Advocates*. (1893. p. 126.) . . . The oral testimony of a prepossessing witness, if skillfully arranged and agreeably and forcibly delivered, is itself a true oration. It conciliates the hearer toward the witness, and also toward the cause for which his evidence is given. It produces faith in the correctness of his assertions, and awakens sympathy with him in his apparent interest in those who call him. It engenders a conviction that the party for whom he appears is in the right, and a disposition to express this conviction by a favorable verdict. It often has more influence than the utterances of the advocate himself, since no suspicion that he acts a part attaches to a witness, and his disinterestedness, if not established, is generally presumed. . . . The reliability of a witness as a source of knowledge is also measured by his power of expressing accurately and intelligibly the ideas which he has received and still retains. The real evidence — that which convinces — is the idea conveyed by the words of the witness to the mind of the jury, and whether this idea corresponds with the facts as they actually occurred depends no less on the propriety of the language in which they are expressed than on the fullness and precision with which they were observed and remembered. Faults of expression in the witness thus become faults of opinion in the jury, and scarcely less prejudicial to the interests of the cause than the utterances of ignorance or falsehood.

Among uncultivated persons habitual errors of expression are not uncommon. They use words in an improper or provincial sense. They employ exaggerating epithets and adjectives. They describe objects, not by delineating their characteristic features, but in fragmentary outlines, or by portraying their most universal indistinctive attributes. They reproduce events, not in their proper order and relations, but with whatever sequence and connection the inspiration of the moment may direct. They do not lead, but mislead, the deductions of their hearers, with the best intentions and sufficient knowledge unwittingly producing false impressions on the minds of those whose mistake originates in the assumption that the words are spoken in the same sense in which they are understood.

248. HANS GROSS. *Criminal Psychology*. (transl. Kallen. 1911. § 59, p. 287.) *The Forms of Giving Testimony*. Wherever we turn we face the absolute importance of language for our work. Whatever we hear or read concerning a crime is expressed in words, and everything perceived with the eye, or any other sense, must be clothed in words before it can be put to use. . . . Yet, who needs this knowledge? The lawyer. Other disciplines can find in it only a scientific interest, but it is practically and absolutely valuable only for us lawyers, who must, by means of language, take evidence, remember it, and variously interpret it. A failure in a proper understanding of language may give rise to false conceptions and the most serious of mistakes. Hence, nobody is so bound as the criminal lawyer to study the general character of language, and to familiarize himself with its force, nature, and development. Without this knowledge the lawyer may be able to make use of language, but, failing to understand it, will slip up before the slightest difficulty. . . .

(a) *Variety in Forms of Expression*. Men being different in nature and bringing-up on the one hand, and language, being on the other, a living organism which varies with its soil, *i.e.* with the human individual who makes use of it, it is inevitable that each man should have especial and private forms of expression. These forms, if the man comes before us as witness or prisoner, we must study, each by itself. Fortunately, this study must be combined with another that it implies, *i.e.* the character and nature of the individual. The one without the other is unthinkable. Whoever aims to study a man's character must first of all attend to his ways of expression, inasmuch as these are most significant of a man's qualities, and most illuminating. . . .

The especial use of certain forms is individual as well as social. Every person has his private usage. One makes use of "certainly," another of "yes, indeed;" one prefers "dark," another "darkish." . . . Even when it is simple to bring out what is intended by an expression, it is still quite as simple to overlook the fact that people use peculiar expressions for ordinary things. . . . Numerous examples may develop with comparative speed in each individual speaker, and, if the development is not traced, may lead, in the law court, to very serious misunderstandings. People who nowadays name abstract things, conceive, according to their intelligence, now this and now that phenomenon by means of it. Then they wonder at the other fellow's not understanding them. . . .

(b) *Conditions Affecting the Mode of Expression*. As a rule it must be maintained that *time*, even a little time, makes an essential difference in the conception of any object. Mittermaier, and indeed Bentham, have shown

what an influence the interval between observation and announcement exercises on the form of exposition. The witness who is immediately examined may, perhaps, say the same thing that he would say several weeks after — but his presentation is different, he uses different words, he understands by the different words different concepts, and so his testimony becomes altered.

A similar effect may be brought about by the *surrounding circumstances* under which the evidence is given. Every one of us knows what surprising differences occur between the statements of the witness made in the silent office of the examining justice and his secretary, and what he says in the open trial before the jury. There is frequently an inclination to attack angrily the witnesses who make such divergent statements. Yet more accurate observation would show that the testimony is essentially the same as the former, but that the manner of giving it is different, and hence the apparently different story. The difference between the members of the audience has a powerful influence. It is generally true that reproductive construction is intensified by the sight of a larger number of attentive hearers, . . . but only when the speaker is certain of his subject and of the favor of his auditors. . . . The interest belongs only to the subject, and the speaker himself receives, perhaps, the undivided antipathy, hatred, disgust, or scorn, of all the listeners. Nevertheless, attention is intense and strained, and inasmuch as the speaker knows that this does not pertain to him or his merits, it confuses and depresses him. It is for this reason that so many criminal trials turn out quite contrary to expectation. Those who have seen the trial only, and were not at the prior examination, understand the result still less when they are told that “nothing has altered” since the prior examination — and yet much has altered; the witnesses, excited or frightened by the crowd of listeners, have spoken and expressed themselves otherwise than before, until, in this manner, the whole case has become different.

In a similar fashion, some fact may be shown in another light by the *manner of narration* used by a particular witness. Take, as example, some energetically influential quality like humor. It is self-evident that joke, witticism, comedy, are excluded from the court room, but if somebody has actually introduced real, genuine humor by way of the dry form of his testimony, without having crossed in a single word the permissible limit, he may, not rarely, narrate a very serious story so as to reduce its dangerous aspect to a minimum. Frequently the testimony of some funny witness makes the rounds of all the newspapers for the pleasure of their readers. Everybody knows how a really humorous person may so narrate experiences, doubtful situations of his student days, unpleasant traveling experiences, difficult positions in quarrels, etc., that every listener must laugh. At the same time, the events told of were troublesome, difficult, even quite dangerous. The narrator does not in the least lie, but he manages to give his story the twist that even the victim of the situation is glad to laugh at.

249. ARTHUR C. TRAIN. *The Prisoner at the Bar*. (2d ed. 1908. p. 236.) The final question to be determined by the juror in regard to the testimony of any witness is how far the latter has succeeded in conveying his actual recollections through the medium of speech and gesture. This necessarily depends upon a variety of considerations. Among these are his familiarity

with the English language; inadvertent accentuation of wrong words or of the less important features of his testimony; his physical condition, which in nine cases out of ten is one of extreme nervousness and timidity, if not of actual fear; and a hundred other trifling, but, in the aggregate, material matters.

The most effective testimony is that which is given with what the jury regard as the evidences of candor. It is a familiar fact that the surer a person is of anything, particularly among the laboring classes, the more loudly will he assert its truth. This is so well known to the jury as ordinarily constituted that unless testimony is given with positiveness it might as well not be given at all. Much as it is to be deprecated, an assertive lie is of much more weight with a jury than an anemic statement of the truth. The juror imagines himself telling the story, and feels that if he were doing so and his testimony were true, he would be so convincing that the jury could have no doubt about it at all. Ofttimes a witness leads the jury to suspect that he is a liar simply because he has too strong a sense of the proprieties of his position vehemently to resent a suggestion of untruthfulness. The gentleman who mildly replies "That is not so" to a challenge of his veracity, makes far less impression on the jury than the coal heaver who leans forward and shakes his fist in the shyster's face, exclaiming: "If ye said that outside, ye little spalpeen, I'd knock yer head off." "Ah," say the jury, "there's a *man* for you." Just as your puritan is at a disadvantage in an alehouse, and your dandy in a mob, so are the hyperconscientious and the oversensitive and refined before a jury. The most effective witness is he whom the general run of jurors can understand, who speaks their own language, feels about the same emotions, and is not so morbidly conscientious about details that in qualifying testimony he finds himself entangled and rendered helpless in his own refinements. A distinguished lawyer testifying in a recent case was so careful to qualify every statement and refine every bit of his evidence that the jury took the word of a perjured loafer and a street-walker in preference. This kind of thing happens again and again, and the wily witness who thinks himself clever in appearing overdisinterested is "hoist by his own petard." The jury at once distrust him. They feel either that he is making it all up, or is in fact not sure of his evidence, else, they argue, he would be more positive in giving it.

Most witnesses in the general run of criminal cases have no comprehension of the meaning of words of more than three syllables. It is hopeless to make use of even such modest members of our national vocabulary as "preceding," "subsequent," "various," etc. A negro when asked if certain shots were "simultaneous" replied: "Yas, boss. Dat's it! 'Zactly simultaneous! One *right after* de odder."

The ordinary witness usually says "minutes" when he means "seconds." He will testify without hesitation that the defendant drew his revolver and immediately shot the complainant, illustrating on the stand the rapidity of the movement. When asked how long it took, he will answer: "Oh, about two or three minutes."

A proper medium in which to converse between the lawyer and witness is sometimes difficult to find, and invariably much tact is required in handling witnesses of limited education. The writer remembers one witness who was completely disconcerted by the use of the word "cravat," and at the precise

moment the attorney was so confused as not to be able to remember any synonym. The Tenderloin and the Bowery have a vocabulary of their own differing somewhat from that of beggars and professional criminals. The language of the ordinary policeman is a polyglot of all three. Popular writers on the "powers that prey," and dabblers in criminology in general, are apt to become the victims of self-alleged "ex-convicts" and "criminals" who are anxious to sell unreliable information for honest liquor. A large part of the lingo in realistic treatises on prison life and "life among the burglars," originates in the doped imagination of whatever fanciful "reformed" thief happens to be the personal gold mine of that particular author. Thieves, like any distinct class, make use of slang, some of which is peculiar to them alone. But for the most part the "tough" elements in the community make themselves easily understood either in the office or on the witness stand.

Where the witness speaks a foreign language, the task of discovering exactly what he knows, or even what he actually says, is herculean. In the first place interpreters, as a rule, give the substance — as they understand it — of the witness's testimony rather than his exact words. It is also practically impossible to cross-examine through an interpreter, for the whole psychological significance of the answer is destroyed, ample opportunity being given for the witness to collect his wits and carefully to frame his reply. One could cross-examine a deaf mute by means of the finger alphabet about as effectively as an Italian through a court interpreter, who probably speaks (defectively) seventeen languages.

250. G. L. DUPRAT. *Le Mensonge: étude de psychosociologie*. (1909. 2d ed. pp. 15, 120.) *Kinds of Lies*. "Some liars add to a true statement by adorning facts, by giving to people, acts, or things non-existent qualities; or by exaggerating the extent, value, etc., of a fact or a relation; or by inventing new facts. They are like the artists, who sometimes simplify or "purify" nature, idealizing it while preserving its essentials, but also sometimes enrich the data of experience by combining them in a new order to make new forms. Thus there are lies (1) of attribution, (2) of addition, (3) of exaggeration, (4) of recombination, (5) of pure fiction. Lies applying to personal qualities or acts include slander, false prosecution, false witnessing. Lies applying to external facts include false representations, fraud in general, and (when a prior oath to deal honestly has been taken) disloyalty. They thus pass beyond mere expressions of the speaker's own thought and include statements of external fact, and it is not possible to draw a boundary between false testimony and fraud. There is an intermediate type, simulation, in which a mendacious assertion combines with false conduct adapted to give it credence. . . .

But the lie of dissimulation must also be included, — the lie by suppressing facts, even without express negation in words or conduct. The false witness, by his words or by his silence, may deny the existence of a fact; the false historian may deny the existence of persons or events which would embarrass his proof of the view to which he is committed; . . . the smuggler is typically a dissimulator, who conceals a part of the truth. Dissimulation, in short, is a negative or inhibitive suggestion, in contrast to simulation or lie in the ordinary sense, which is a positive suggestion.

The two extreme types of lie are therefore the *positive*, which creates a complete fiction, interpolated by imagination in the world of reality, and the *negative*, which removes from outward expression whatever might furnish a clew to the truth. Between these two extremes may be arranged the other types, in the order of their affinities ; thus :

| Classification of Lies (or, Modes of Suggesting Error) | | | | | | | | | |
|--|---|---|---|---|-----------------|---|---|--|--|
| A. Positive Suggestion | | | | | contrasted with | | B. Negative Suggestion | | |
| Invention (slander, fraud, false prosecution, false witness) | | | | | | | { Complete dissimulation ; denegation ; suppression of testimony. | | |
| Fiction, simulation | | | | | | | | | |
| Addition | . | . | . | . | . | . | Omission | | |
| Deformation | . | . | . | . | . | . | Mutilation | | |
| Exaggeration | . | . | . | . | . | . | Attenuation | | |

To this classification of lies would correspond that of liars. Those who make positive suggestions exhibit capacity of invention ; those who make negative suggestions are frequently lacking in imagination. . . . Of course, many lies are mixed in character, partaking both of positive and of negative suggestion. Moreover, every lie in so far as it creates a new form for some supposed fact is deformative, and thus is in a sense a positive suggestion ; so that every liar to this extent uses imagination. Nevertheless there is always, within the same group, a relative contrast between the liar who needs more or less mental activity to construct or amplify, and the one who needs merely deny, suppress, or mutilate, without having to invent anything but what is furnished him in the very experience which he desires to impress falsely on the other person. . . .

The lie, then, may be thus defined : A psychosociologic fact of suggestion, oral or otherwise, by means of which one tends, more or less intentionally, to introduce into another's mind a belief, positive or negative, not in harmony with what the actor supposes to be the truth.

Neuromuscular phenomena of the lie. Does the liar's mental state manifest itself by any biologic modifications ? As to persons of strong character, skillful to the point of dissimulating the very sentiment which they experience in the act itself of dissimulation, it is certainly difficult to discover in them the traces of the lie. On the other hand, children usually betray themselves readily enough.¹ Some children are reported as lying "with apparent candor" ; but these are the scarcely conscious lies, for young beings are rare who dissimulate to the point of giving every appearance of candor. Many are embarrassed ; they are uneasy under the inquirer's gaze ; their eyes will not meet yours ; and they show a haste to escape from further scrutiny, by making involuntary movements to get away or to elude attention or to take up some new activity. Some, in spite of an apparent coolness, cannot avoid contracting the muscles, tapping the sole of the foot in a certain rhythm, crunching something in their fingers, or plunging their hands in their pockets and then taking them out in alternate movements. Others

¹ The investigations of the Society for the Psychological Study of Children will here yield still other valuable results.

show their uneasiness by an excitement, an exaggerated boldness amounting to insolence; in their emotion they go beyond all moderation in the passionate expression of their assertions, in the volubility of their language, in the quickness of their answers, or in the audacity of their questions; a sudden release of control seems to give vent to a flow of words which threaten to become incoherent, as in lunatics afflicted with acute mania. In some children, while speech becomes copious, the voice is low, yet with others it is high pitched with outbursts like spasms. The excitement may induce only vasomotor modifications, blushes, or paleness, or each alternatively. Sometimes the only perceptible mark is a trembling of the hand, or a winking of the eyes, or a rapid dilation of the nostrils, or a slight creasing of the hairy skin, or an odd smile either fugitive or lasting and then almost inscrutable. The protrusion of the lips, or their contraction with discoloration of the mucus, sometimes replaces the smile. In some instances, the liar tosses his head; sometimes he watches for some sign of acquiescence; sometimes he fluctuates between boldness and confusion.

This diversity of physiologic manifestations of the mental state of lying demonstrates plainly that it involves an affective (emotional) condition. As William James has shown, affective phenomena consist essentially, from the physiological point of view, in a greater or less number of muscular and vasomotor reflexes, forming combinations so varied that any classification of the emotions is impossible. In the state of lying there are phenomena either of excitation or of depression or of the one alternating with the other.

Nevertheless, we must not confuse affective phenomena, strictly so-called, with the phenomena of expressive mimicry due to simulation and aimed at producing or increasing the confidence of a watching auditor. . . . For example, a liar may simulate laughter; and when the simulation is a poor one, we have the "forced laugh," in which only facial displacements occur without the expression of a true geniality; the lips are merely parted, the nasolabial furrow is bent convexly inward for most of its length, the creased skin radiates in wrinkles around the eyes towards the temples.

After allowing for these physiologic modifications which may accompany the lie without being an intrinsic mark of it, we may still concede that *no intentional derogation from the truth can take place without a tendency to muscular contractions or expansions*, — phenomena of inhibition or excitation. The reason for this must be sought in that cerebral physiology which is the basis for a psychological explanation of the lie.

Psychology of the lie. We have seen that the lie is either a positive, more or less complex invention, or a negative invention. But throughout all it includes an act of imagination. Lying invention shows all the species of imagination so well classified and described by Ribot in his great work on "The Creative Imagination." . . . There is the plastic imagination, the diffuent imagination, the mystical imagination, the scientific imagination, the practical imagination, the commercial imagination, the utopian imagination. We may safely assert — a truism, to be sure, but a necessary one — that all species of imagination may serve, not only to discover truths, but to invent lies. But what seems to be the peculiarity of imagination used in lying is that it can go to the length of completely negating the existence of the object in question. . . . In contrast with the other species, it alone can be

simply negative. In certain cases, then, we have *inhibition*, rather than production.

Among the neuromuscular phenomena characteristic of a psycho-physiologic lying state, we have often above noted acts of contradiction, of repression of incipient movements, — in short, of inhibition. The liar must keep from expressing aloud his thought. He is not merely imagining; he is at the same moment conceiving something which he ought truly to express and something different which he is to succeed in suggesting to others. The process is thus more complex than in merely creative imagination. Now if there is any law of psychopathology that is well established by experiment or observation, it is this,¹ that *every clear and living idea engenders the corresponding movement*. Hence it must be conceded that a very clear mental representation of something which one ought to be telling — and it is very clear in many instances of derogation from the truth, and clearer in proportion as the sense of duty may be prompting obedience — engenders a strong tendency to pronounce the suitable words and to make the gestures or postures naturally accompanying that thought. Thence occurs often a violent antagonism between this natural propensity and the other inclination (casual or habitual) to disguise the truth by affirming something different. Before this antagonism can attenuate to the point where dissimulation becomes easy, the habit of telling the thing contrary to what one ought to tell must have become a strong one. Hence we come to a distinction between the casual liar and the habitual liar, — the liar who promptly confounds himself, and the tenacious liar who persists in his lie.

The *casual* liar may be a person having a vivid imagination or experiencing a lively emotion, who impulsively affirms or denies without precise reflection on his erroneous assertion and the distance between it and the truth. It is only when he receives some check that he definitely conceives the truth. Then he may either persist in his falsity, through vanity, pride, self-esteem, or shame; or may hasten to some other topic; or may recant. If he recants, one may perhaps detect slight symptoms of lack of frankness; if he hastens to leave the subject, he usually betrays himself by his precipitateness or worried air; if he persists, he tends to become the habitual liar and needs now a great power of inhibition.

With the *tenacious* liar, the lie is generally habitual. Fatigue, worry, uneasiness, recur as infrequently as the inhibition has been frequent. The physiological marks of lying are less apparent, the muscular contractions less forcible and particularly less spasmodic. He is more at home in supporting his assertions by a persuasive mimicry, — facial expressions appropriate to frankness, smiles less false, intonations less artificial, etc. Mendacious invention here tends to free itself from almost all the shackles customarily provided by a consciousness of the truth.

251. A. C. PLOWDEN. *Grain or Chaff; the Autobiography of a Police Magistrate*. (1903. p. 225.) . . . It would be unreasonable, however, to turn your eyes away altogether. Indeed, it is not possible to do it. You cannot watch a face too closely, provided you can trust yourself not to be led away by too hasty inferences. Much of the interest of my work I feel to lie in a close scrutiny of the human countenance, whether in the dock or the witness

¹ See P. Janet, *L'automatisme psychologique*.

box. I make a mental note if a prisoner has abnormal ears. They are often significant. And if I am doubtful about a witness speaking the truth, I direct my attention to his mouth and to his hands. The mouth is perhaps the most expressive feature, and the hands of a liar are seldom at rest. But where I often think much is to be learned from a witness is *after* he has given his evidence and left the box. I continue to watch him as he sits unsuspectingly in his place in the court, while other witnesses, especially those that are opposed to him, are examined. The expressions that pass over his face on these occasions are often very instructive.

252. AMOS C. MILLER. *Examination of Witnesses*. (Illinois Law Review. 1907. Vol. II, p. 257.) It is, of course, of the greatest importance to be able to determine whether a witness is willfully falsifying or whether he is honestly mistaken. Of course, there are all degrees between an honest mistake and a willful lie. How to correctly measure the elements of this honesty in a witness's testimony is largely a matter of experience which each man is compelled to gain for himself. But there are a few suggestions which may be of assistance. A witness who is testifying falsely will, as a rule, try to evade, on cross-examination, questions on collateral matters; this, of course, in order to avoid the danger of being entrapped. He will frequently ask the cross-examiner to repeat plain, simple questions in order to give him a chance to think up a consistent reply. He will often carefully and slowly repeat over a question on cross-examination for the purpose of giving him time to think; or he will answer irresponsively in order to steer the cross-examiner off the track. I have also observed that the witness who is swearing to a clear-cut lie will, while so doing, throw back his head with an indifferent air and close his eyes or blink. My experience has taught me to believe that that is an almost certain sign of deliberate dishonesty.

Topic 2. Narration as affected by Interrogation and Suggestion

253. RICHARD HARRIS. *Hints on Advocacy*. (Amer. ed. 1892. p. 29).

I. One of the most important branches of advocacy is the examination of a witness *in chief*. . . . One fact should be remembered to start with, and it is this: the witness whom he has to examine has probably a plain, straightforward story to tell, and that upon the telling it depends the belief or disbelief of the jury, and their consequent verdict. If it were to be told amid a social circle of friends, it would be narrated with more or less circumlocution and considerable exactness. But *all the facts would come out*; and that is the first thing to insure, if the case be, as I must all along assume it to be, an honest one. I have often known half a story told, and that the worst half, too, the rest having to be got out by the leader in reëxamination, if he have the opportunity. If the story were being told as I have suggested, in private, all the company would understand it, and if the narrator were known as a man of truth, all would believe him. It would require no advocate to elicit the facts or to confuse the dates; the events would flow pretty much in their natural order. Now change the audience; let the same man attempt to tell the same story in a court of justice. His first feeling is that he must not tell it in his own way. He is going to be *examined* upon it; he

is to have it dragged out of him piecemeal, disjointedly, by a series of questions—in fact, he is to be interrupted at every point in a worse manner than if everybody in the room, one after another, had questioned him about what he was going to tell, instead of waiting till he had told it. It is not unlike a post mortem; only the witness is alive, and keenly sensitive to the painful operation. He knows that every word will be disputed, if not flatly contradicted. He has never had his veracity questioned, perhaps, but now it is very likely to be suggested that he is committing rank perjury.

This is pretty nearly the state of mind of many a witness, when for the first time he enters the box to be examined. In the first place, then, he is in the worst possible frame of mind to be *examined*—he is agitated, confused, and bewildered. Now put to examine him an agitated, confused, and bewildered young advocate, and you have got the worst of all elements together for the production of what is wanted, namely *evidence*. First of all, the man is asked his name, as if he were going to say his catechism, and much confusion there often is about that, the witness feeling that the judge is surprised, if not angry, at his not having a more agreeable one, or for having a name at all. He blushes, feels humiliated, but escaping a reprimand thinks he has got off remarkably well so far. Then he faces the young counsel, and wonders what he will be asked next.

Now the best thing the advocate can do under these circumstances is to remember that the witness has something to tell, and that but for him, the advocate, would probably tell it very well, “in his own way.” *The fewer interruptions, therefore, the better; and the fewer questions, the less questions will be needed.* Watching should be the chief work; especially to see that the story be not confused with extraneous and irrelevant matter. . . . The most useful questions for eliciting facts are the most commonplace, “What took place next?” being infinitely better than putting a question from the narrative in your brief, which leads the witness to contradict you. The interrogative “Yes?” as it asks nothing and yet everything is better than a rigmarole praise, such as, “Do you remember what the defendant did or said upon that?” The witness after such a question is generally puzzled, as if you were asking him a conundrum which is to be passed on to the next person after he has given it up.

Judges frequently rebuke juniors for putting a question in this form: “*Do you remember the 29th of February last?*” In the first place, it is not the *day* that has to be remembered at all, and whether the witness recollects it or not is immaterial. It is generally the *facts* that took place about that time you want deposed to, and if the date is at all material, you are putting the question in the worst possible form to get it. A witness so interrogated begins to wonder whether he remembers the day, or whether he does not, and becomes puzzled. We don’t remember *days*. You might just as well ask if he remembers the 1st of May, 1816, the day on which he was born, instead of asking him the date of his birth. This is one of the commonest, and at the same time one of the stupidest blunders that can be made. I will, therefore, at the risk of repetition, give one more illustration. Suppose you ask a witness if he remembers the 10th of June, 1874; he probably does not, and both he and you are bewildered, and think you are at cross-purposes; but ask him if he was at Niagara in that year, and you will get the

answer without hesitation; inquire when it was, and he will tell you the 10th of June. In this way you will avoid taxing a witness's memory; always a dangerous proceeding.

Another common error is worth noting, and that is the not permitting a witness to finish his answer, or tell all he knows on a material matter. In the very midst of an important answer a witness is very often interrupted by a frivolous question upon something utterly immaterial. This seems so absurd on paper that it needs an example. A witness is giving an answer when some such question as this is interposed! "What time was this?" or, "Had you seen Mr. Smith before this?" A question is often left half answered by such interruptions, the better half perhaps being untold. "He never asked me about that," says the witness after the case is over; or, "I could have explained that if he had let me." . . . All unnecessary interruptions produce confusion in the mind of the witness and jury and tend to the damage of your case.

But although it is by far the best to let a witness tell his story in his own way as much as possible, it is absolutely necessary to prevent him from rambling into irrelevant matter. Most uneducated witnesses begin a story with some utterly irrelevant observation, such as, if they are going to tell what took place at a fire, they will say, "I was just fastening up my back door, when I heard a shout." Get him as soon as you can at the fire and the evidence will come with little trouble.

Every question should not only be intelligible and relevant in itself, but it should be put in such a form that its relevancy to the case may be apparent to *him*. A question, without being leading, should be a *reminder* of events rather than a test of the witness's recollection. I will give an illustration which will show how easy it is to blunder, and how necessary it is to avoid blundering. A man brings an action against a railway company for false imprisonment. The facts are these: He lost his ticket and refused to pay; the porter on the platform called the inspector, who sent for a policeman, and then gave him into custody. The best way *not* to get the facts out is to examine him in the following manner:—

"Were you asked for your ticket?—Yes."

"Did you produce it?—No."

"Why not?—I had lost it."

"Are you sure you took it?—Quite."

"Positive? (This is a good opening for the wedge of cross-examination—a doubt thrown on your own witness.)—I am quite sure."

"What did the defendants say then; I mean the porter?" (This blunder ought not to have been made.) At this point the witness is in a hopeless muddle, and says: "I was given into custody."

The story is not half told, although it is one of the simplest to tell.

Now the counsel contradicts by way of explanation, and says, "No, no; do attend." Witness strokes his chin as though about to be shaved. Judge glances at him, and wonders if he's lying. Counsel for the defendants (sure to be eminent) smile, and the jury look knowingly at one another, and begin to think it's a trumped-up attorney's action.

Now start again with another question.

"When the train stopped you got out?—I didn't get out afore it stopped, sir."

"Did any one ask you for your ticket? — They did;" emphatically, as though he knows now where he is.

"Who? — I'm sure I don't know who he is; never seen the man before in my life."

"Well, well, did he *do* anything? — No, sir; he didn't do nothin' as I knows of;" evidently puzzled, as if he had forgotten some important event upon which the whole case turns.

This looks so ridiculous on paper that it is possible some readers will doubt if it ever happened. I can only say there are many much more ridiculous incidents that occur in courts of justice when young counsel have what is called a "stupid" witness in the box. In court the stupidity always seems to be that of the witness; on paper it looks as if the learned counsel could establish a better title to it.

This leads me to notice a cardinal rule in examination in chief. It is seldom regarded as such by beginners, and only seems to be observed as the result of experience. Why it should not be learned at once and implicitly obeyed I do not know, except it be that it has never been written down. The rule is this, that in examining a witness *the order of time ought always to be observed*. Stated in writing, it looks simple enough, and everybody says "of course." Plain as one of the ten commandments, and as often violated by young advocates.

In putting questions *long-drawn sentences should be avoided*. The following is an almost verbatim report. The advocate was experienced, but he was anxious to get as much as he could into a question; and whenever your question is too large the answer will be worthless:

"Were you present at the meeting of the trustees when an agreement was entered into between them and the plaintiff?" Answer, "Yes."

Q. "Will you be kind enough to tell us what took place between the parties with reference to the agreement that was then entered into between them?"

The more neatly a question is put, the better, as it has to be understood not only by the witness, but by the jury. All that was necessary to be asked might have been put in the following words: "Was an agreement entered into between the trustees and the plaintiff?" — "Yes." "What was it?" It will appear even more strange that after the answer was given by one witness, which was all that was necessary to prove that part of the case, the question was repeated to another with additional verbiage.

"Will you be good enough to inform us what took place upon that occasion between the parties, as nearly as you can, with reference to the agreement that was then, as you have stated, entered into between them. Please tell us, not exactly, but as nearly as you can in your own way what his exact words were?"

II. Next to examination-in-chief nothing is more important or difficult in advocacy than *cross-examination*. It is infinitely the most dangerous branch, inasmuch as its errors are almost always irremediable. It is in advocacy very like what "cutting out" is in naval warfare, and you require a good many of the same qualities; courage with caution, boldness with dexterity, as well as judgment and discrimination. . . . Cross-examination may almost be regarded as a mental duel between advocate and witness. The first requisite therefore on the part of the attacking party (namely, the

advocate) is a knowledge of human character. This is the first requisite, and it is an indispensable one. But I suppose almost everybody conceives himself to be a master of this science.

With respect to style, as before remarked, every man has his own, or should have. . . . With regard to manner, a man should imitate the best. The most eminent are as a rule the most unaffected, and the quiet, moderate manner is generally the most effective. I do not intend to imply that bluster and a high tone will not sometimes unnerve a timid witness, but this is not cross-examination or true advocacy. It is not art, but bullying — not intellectual power, but mere physical momentum. Nor would I say that an advocate should at all times treat a witness with the gentleness of a dove. Severity of tone and manner, compatible with self-respect, is frequently necessary to keep a witness in check, and to draw or drive the truth out of him if he have any. But the severity will lose none of its force, nay, it will receive an increase of it, by being furbished with the polish of courtesy instead of roughened with the language of uncompromising rudeness. Instances of the latter kind are extremely rare at the English bar. But they do occasionally appear, and are usually followed by a public outcry against them; they do not, however, cast discredit on the great body of a profession which is as jealous of its high reputation for courtesy and honor as it is deserving of it.

I make these observations because I am about to quote a passage from Archbishop's Whateley's "Elements of Rhetoric" on Cross-examination, wherein he passes a severe stricture upon advocates generally, and which, I am sure, so far as my own experience and observation go, is utterly undeserved. At page 165, he says: "In oral examination of witnesses a skillful cross-examiner will often elicit from a reluctant witness most important truths which the witness is desirous of concealing or disguising. There is another kind of skill, which consists in so alarming, misleading, or bewildering an *honest* witness as to throw discredit on his testimony or prevent the effect of it. On this kind of art, which may be characterized as the most, or one of the most, base and depraved of all possible employments of intellectual power, I shall only make one further observation." I pause here for a moment to say that so far as my experience of the bar is concerned, and I think it must be greater than that of the Right Reverend Father in God who penned these words, a more undeserved slander against a body of honorable men was never penned even by a Churchman. He proceeds to say: "I am convinced that the most effectual mode of eliciting truth is quite different from that by which an honest, simple-minded witness is most easily baffled and confused. I have seen the experiment tried of subjecting a witness to such a kind of cross-examination by a practiced lawyer as would have been, I am convinced, the most likely to alarm and perplex many an honest witness without any effect in shaking his testimony. . . . And afterwards, by a totally opposite mode of examination, such as would not have at all perplexed one who was honestly telling the truth" (nothing, it seems, will perplex an honest witness but an alarming style) — "that same witness was drawn on step by step to acknowledge the utter falsity of the whole. Generally speaking, I believe that a quiet, gentle, and straightforward — though full and careful — examination, will be the most adapted to elicit truth, and that the manoeuvres and the browbeating which are the most adapted to

confuse an honest witness are just what the dishonest one is the best prepared for." When I read those wordy sentences I could not help thinking it was a pity that the Archbishop did not confine himself to theology. He seems to think an honest witness easily baffled and frightened into telling a lie, and to imagine that a brutal liar is best induced to tell the truth by wooing him with sweet words, and by a *straightforward, full, and careful* examination. I can only say his acquaintance with truthful witnesses must have been small indeed, and the hypocrisy practiced upon his gentle questioning must have misled him into the falsest views of human nature ever formed even by those who assume to be the best acquainted with man's spiritual existence.

254. **BARDELL v. PICKWICK.** (CHARLES DICKENS. *The Pickwick Club*. 1837. c. XXIV.)

"Nathaniel Winkle!" said Mr. Skimpin. "Here!" replied a feeble voice. Mr. Winkle entered the witness box, and having been duly sworn, bowed to the judge with considerable deference. "Don't look at me, sir," said the judge,¹ sharply, in acknowledgment of the salute; "look at the jury." Mr. Winkle obeyed the mandate, and looked at the place where he thought it most probable the jury might be; for seeing anything in his then state of intellectual complication was wholly out of the question. Mr. Winkle was then examined by Mr. Skimpin, who, being a promising young man of two or three and forty, was of course anxious to confuse a witness who was notoriously predisposed in favor of the other side, as much as he could. "Now, sir," said Mr. Skimpin, "have the goodness to let his Lordship and the jury know what your name is, will you?" And Mr. Skimpin inclined his head on one side to listen with great sharpness to the answer, and glanced at the jury meanwhile, as if to imply that he rather expected Mr. Winkle's natural taste for perjury would induce him to give some name which did not belong to him. "Winkle," replied the witness. "What's your Christian name, sir?" angrily inquired the little judge. "Nathaniel, sir." "Daniel, — any other name?"

"Nathaniel, sir — my Lord, I mean." "Nathaniel Daniel, or Daniel Nathaniel?" "No, my Lord, only Nathaniel — not Daniel at all." "What did you tell me it was Daniel for then, sir?" inquired the judge. "I didn't, my Lord," replied Mr. Winkle. "You did, sir," replied the judge, with a severe frown. "How could I have got Daniel on my notes, unless you told me so, sir?" This argument was, of course, unanswerable. "Mr. Winkle has rather a short memory, my Lord," interposed Mr. Skimpin, with another glance at the jury. "We shall find means to refresh it before we have quite done with him, I dare say." "You had better be careful, sir," said the little judge, with a sinister look at the witness. Poor Mr. Winkle bowed, and endeavored to feign an easiness of manner, which, in his then state of confusion, gave him rather the air of a disconcerted pickpocket. "Now, Mr. Winkle," said Mr. Skimpin, "attend to me, if you please, sir; and let me recommend you, for your own sake, to bear in mind his Lordship's injunctions to be careful. I believe you are a particular friend of Pickwick, the defendant, are you not?" "I have known Mr. Pickwick now, as well as I recollect at this moment, nearly" — "Pray, Mr. Winkle, do not evade

¹ The name "Stareleigh," given by the novelist to this judge, is supposed to have signified Mr. J. Gaselee.

the question. Are you, or are you not, a particular friend of the defendant's?" "I was just about to say, that" — "Will you, or will you not, answer my question, sir?" "If you don't answer the question, you'll be committed, sir," interposed the little judge, looking over his notebook. "Come, sir," said Mr. Skimpin, "yes or no, if you please." "Yes, I am." "Yes, you are. And why couldn't you say that at once, sir? Perhaps you know the plaintiff too — eh, Mr. Winkle?" "I don't know her; I've seen her." "Oh, you don't know her, but you've seen her? Now, have the goodness to tell the gentlemen of the jury what you mean by *that*, Mr. Winkle." "I mean that I am not intimate with her, but that I have seen her when I went to call on Mr. Pickwick, in Goswell Street." "How often have you seen her, sir?" "How often?" "Yes, Mr. Winkle, how often? I'll repeat the question for you a dozen times, if you require it, sir." And the learned gentleman, with a firm and steady frown, placed his hands on his hips, and smiled suspiciously at

the jury. On this question there arose the edifying browbeating, customary on such points. First of all, Mr. Winkle said it was quite impossible for him to say how many times he had seen Mrs. Bardell. Then he was asked if he had seen her twenty times, to which he replied, "Certainly, — more than that." Then he was asked whether he hadn't seen her a hundred times — whether he couldn't swear that he had seen her more than fifty times — whether he didn't know that he had seen her at least seventy-five times — and so forth; the satisfactory conclusion which was arrived at, at last, being, that he had better take care of himself, and mind what he was about. The witness having been by these means reduced to the requisite ebb of nervous perplexity, the examination was continued. . . . Tracy Tupman and Augustus Snodgrass were severally called into the box; both corroborated the testimony of their unhappy friend; and each was driven to the verge of desperation by excessive badgering.

255. JOHN C. REED. *Conduct of Lawsuits*. (2d ed. 1912. § 90.) . . . I note that the wary veterans of the courts cross-examine less and less as they grow older in practice. By the multitude, cross-examination is as much overrated as advocacy. Sometimes a great speech bears down the adversary, and sometimes a searching cross-examination turns a witness inside out and shows him up to be a perjured villain. But ordinarily cases are not won by either speaking or cross-examining. The tyro's conception of the purpose of the latter is that it is to involve every adverse witness in an inconsistency or self-contradiction. But you will often see a dozen consecutive cases tried wherein no witness who is game for the cross-examiner makes his appearance. It is only the profligate who swears falsely; and if not the profligate, it is the extremely heedless who make such glaring blunders and mistakes as to destroy the credit of their testimony.

These cautions are placed in the forefront of the chapter, to be meditated before the student comes to the places farther on, where copious use is made of the writings of Mr. Cox and Mr. Harris, who, while giving very valuable instructions, yet hurtfully exaggerate what can be effected by cross-examination. Mr. Cox says, "There is never a cause contested, the result of which is not mainly dependent upon the skill with which the advocate conducts his cross-examination." In Mr. Harris's "Hints," it is implied in a few passages that there are witnesses who cannot be shaken, yet the bulk of what

he says and his chief stress are in dealing with those whose direct testimony is overturned by the questions of the adverse counsel; and consequently the most careful reader infers that he thinks cross-examination can be made to do wonders in almost every case. Long ago, Quintilian gave the subject a somewhat better treatment, which has been highly applauded by different English and American writers. But the doctrine of the current books of the day lags behind the prevailing practice of the best lawyers. This doctrine is that of Mr. Cox and Mr. Harris, as indicated above. It is utterly misleading; for it is generalized from exceptional instances, and takes hardly any account of the kind of witnesses whose testimony wins more than three fourths of the verdicts in our courts. . . . The practice and judgment of Scarlett, the great English lawyer who lost fewer cases than he ought to have won and won more than he ought to have lost than any other hero of legal biography, outweigh the opinions of the authors mentioned. . . . It was his custom, rarely departed from, merely to probe his adversary's witnesses for further proof of his own case, scorning to waste his time in badgering them by an examination more entertaining to visitors than effective with the jury. He says in his Autobiography: ". . . I cross-examined in general very little, and more with a view to enforce the facts I meant to rely upon, than to affect the witness's credit, — for the most part a vain attempt."

Having premised as above in order to protect the student against prevalent errors and to foreshadow to him the main end of cross-examination, we will now pursue our subject. And we adopt the plan followed in the last chapter; that is, we begin with average witnesses, and we award due prominence to the methods most common in actual practice. . . . You cross-examine these three classes: (1) The witness whose version you accept so far as it goes. (2) The witness whom you show to be mistaken, or the force of whose testimony you take off by other means, not however attacking his veracity. (3) The witness whom you show to be unworthy of credit. We add that there are really but two kinds of witnesses, the truthful and the untruthful; and consequently there are at bottom but two kinds of cross-examination, the one intended to elicit friendly evidence, and the other to show the unreliability of the witness. We wish to impress it upon our student that the first kind is *in general use in every sort of case*, while the second is only of *occasional* importance.

We now take up the witness mentioned in the first class of our enumeration, that is, he whose version you accept as far as it goes. Your objects with him are but two, (a) the first to have him complete what the direct examiner has incompletely presented through such partial questions as will be explained in a moment, and (b) the second to make him, if you can, reënforce your own proofs.

(a) The examiner in chief is privileged to ask such relevant questions as he pleases, and to keep the witness from answering anything more. He generally culls from what the latter knows of the matter in controversy such parts only as are favorable. . . . If you observe the trial of issues of fact, you will note that nearly every witness is made to suppress some important parts of a transaction while replying to the direct examiner; and that often, where he is given free range by being told to make his statement in his own way, he omits some details which would aid the other side should they be

proved. To make the witness give a *complete* narrative, if what has been kept back is favorable to your side, may be regarded as the point where cross-examination should generally begin. . . .

(b) We now come to what is practically the most effective and most widely useful of all the different sorts of cross-examination. In it you have the opposite witness to prove *independent facts* in your favor. . . . A person may have been present when a sum of money was borrowed, and he may also have seen the money repaid afterwards to one who is claimed to have been the agent of the lender to receive it. If this witness testifies for the plaintiff on the trial of a suit for the money, his counsel will ask nothing about the repayment. He may not even know of it. But you have been told of it by your client, and you therefore will draw it out when you take the witness. . . . Note the usual cross-examinations by good practitioners, and you will find that in a large proportion they ask hardly any questions except such as are now our special subject. In most cases they see intuitively that there is no very distorted statement to be rectified, and that there are no serious mistakes to be corrected ; and they only make the witness reënforce their side as to some detail. . . . While the kind of cross-examination now in hand is the most important of all, it is also the most easy. It requires no great skill. It will generally be well done if with patience you have had your client and his following to tell you all that the witnesses for the other side know in his favor, and you then question accordingly.

As we leave this branch of the subject, we must ask you not to fall into the error of rating its place in practice by the short notice it has received from us. It is too simple to need much explanation. But if you stay at the bar, you will have increasing use for it, and after a while you will, as a general rule, prepare no other sort of cross-examination for the average witness. It is a larger field for your powers than appears at first. The cross-examiner requires much attention and assiduity to collect from the opposite witnesses all the help possible. It is not only such important facts as we used for illustration in the last section that he must search for. They would be overlooked by only a very dull man. He is to exhaust many details ; such as strengthening one of his own witnesses stoutly attacked by having the witness under examination to concur with him in even a small matter ; the conduct, expression, or language of the adverse party on some occasion which the latter has probably forgotten ; minute circumstances, such as the shapes and positions of marks ; in short, the details relevant here are as varied and extensive as the entire possibilities of proof.

256. AMOS C. MILLER. *Examination of Witnesses*. (Illinois Law Review. 1907. Vol. II, p. 257.) . . . I have said above that it is necessary to treat a witness who is honestly mistaken very differently from the way you treat a witness who is lying. The truth of this is manifest. If the witness who is honestly mistaken is treated harshly or in a manner which shows to him that his cross-examiner believes him to be lying or wants his hearers to so believe, he will quickly resent it and strengthen his testimony upon the very points on which it is desired to weaken him. If, on the contrary, the honestly mistaken witness has his attention called to collateral matters inconsistent with his testimony, and the truth of which he is likely to recognize, and if he at the same time is treated courteously and considerately, he is quite

likely either to change his testimony or modify it or become so uncertain as to make his testimony utterly worthless to the party calling him. He may gain so favorable an impression of the cross-examining counsel, and of his superior knowledge of the facts in the case, that he will suddenly develop an extreme conscientiousness about testifying to things of which he is not perfectly certain.

257. G. M. WHIPPLE. *Manual of Mental and Physical Tests*.¹ (1910. p. 404.) *Tests of Suggestibility*. The term "suggestion" has found different usages in psychology. Four different usages at least may be distinguished. (1) Suggestion is equivalent to association, *e.g.* the idea "horse" suggests the idea "Black Beauty." (2) Suggestion is the conveyance of an idea by hint, intimation, or insinuation, *e.g.* the orator suggests an idea by an appropriate gesture. (3) Suggestion is a method of creating and controlling hypnosis. (4) Suggestion is a method of creating belief or affecting judgment, usually an erroneous belief or false judgment, in the normal consciousness.

The tests which follow all purport to measure susceptibility to suggestion in this last-named sense. In them, the experimenter seeks by suitable arrangement of the test material or of the instructions, to induce the subject to judge otherwise than he naturally would — to induce him, for example, to judge equal lines or equal weights to be unequal, or to perceive warmth when there is no warmth, etc. If the attempt is successful, the subject is said to have yielded, or to have "accepted" the suggestion. The degree of his suggestibility is indicated by the quickness or frequency of his "yields."

Efficiency in observation, attention, memory, and the like has been shown to be specific, not general in character. For this reason, suggestibility must be tested by more than one method. . . .

Test 42. Suggestion by Progressive Lines. . . . Arrange the kymograph drum so that it may lie horizontally and be revolved freely by hand. . . . On the strip of white paper, draw with a ruling pen 20 parallel, straight black lines, 2 cm. apart and each 1 mm. wide. . . . Seat S² 50 cm. from the screen and provide him with a sheet of cross-section paper. The instructions should take the following form: "I want to try a test to see how good your 'eye' is. I'll show you a line, say an inch or two long, and I want you to reproduce it right afterwards from memory. Some persons make bad mistakes: they may make a line 2 inches long when I show them one 3 inches long; others make one 4 or 5 inches long. Let's see how well you can do. I shall show the line to you through this slit. Take just one look at it, then make a mark on this paper (cross-section paper) just the distance from this edge (left-hand margin) that the line is long. When that is done, I shall show you the second line, then the third, and so on. . . . E then turns the drum to bring the first, or shortest, line into view. As soon as S turns his attention to the recording of his estimate on the paper, the drum is moved forward slightly to conceal the line so that further comparison is impossible. As soon as S has placed his mark, then, and not before, the next line is exposed. This precaution serves to maintain the impression that a new, and hence probably a longer, line is exposed. . . . If S has ceased to respond to the

¹ Published at Baltimore, by the Warwick & Yorke Co.

² [S = Subject, *i.e.* person to be experimented upon. — Ed.]

suggestion of progressive augmentation at the 20th exposure, the test ends at that point. . . . For a measure of suggestibility, E may take the number of lines out of the last 10 lines that are drawn longer than the 5th line was drawn. . . .

Results. . . . (3) Inspection of the records of individual pupils shows that in some cases the force of suggestion was steady and persistent, while in others it reached a maximum, and then declined. (4) Extremely suggestible S's may make their "estimate" of the line without even looking at it when exposed; their minds are so completely dominated by the suggestion of uniform augmentation that they do not trouble to observe the stimulus. . . . (6) In either form of test, the 1st line is apt to be overestimated. The 5th line is almost invariably underestimated. Generally speaking, this underestimation is less pronounced in those S's that least prove least suggestible.

Test 43. Suggestion of line lengths. . . . [Two forms of suggestion may be used]; the first Binet terms "contradictory suggestion," the second "directive suggestion" ("suggestion directrice"): in the former E makes certain statements that are intended to interrupt or modify a judgment that S has just made; in the latter, statements that are intended to control or influence a judgment that S is just about to make.

A. Contradictory Suggestion. Materials. Drawing utensils. A sheet of cardboard upon which are drawn in ink 24 parallel, straight black lines, ranging in length from 12 to 104 mm., by increments of 4 mm. The lines all begin at the same distance from the left-hand margin, are 7 mm. apart, and are numbered in order of their length, from 1 to 24. These rectangular pieces of cardboard, about 12 × 20 cm., on each of which is drawn a single straight line. These three stimulus lines correspond to numbers 6, 12, and 18 of the 24 comparison lines, and are, accordingly, 32, 56, and 80 mm. long, respectively.

Method. Show S the card of comparison lines, and explain their numbering. Replace this by the first stimulus line (32 mm.), saying: "Look carefully at this line." After 4 sec., remove the stimulus card, present the comparison card, and say: "Tell me the number of the line that is just the length of the one I showed you." At the moment that S gives his judgment, E says: "Are you sure? Isn't it the —th?" —indicating always the next longer line. If S answers "No," E repeats the question in exactly the same form. If S still answers "No," the attempt to produce suggestion is suspended, and the case is recorded as one "resistance." The second and the third stimulus lines are presented and the same procedure is followed in each case. If, in any of the trials, S answers "Yes," E then inquires: "Isn't it this one?" —indicating the next longer line and this inquiry is carried on from line to line until S has twice resisted the suggestion, *i.e.* has twice answered "No" to the same question. . . .

Results. . . . (2) Of 25 children, aged 8–10 years, Binet found 6 who resisted suggestion completely, 6 who "yielded" once, 5 twice, 2 three times, 2 four times, and 1 each six, seven, and more than seven times. . . . (4) S's who have selected the correct line are less apt to change their designation under suggestion than are S's who have selected the wrong line: thus Binet and Henri found that 56 per cent changed their selection when it was actually right, but 88 per cent when it was wrong. Moreover, of the latter, 81 per cent made the change in the proper direction.

B. Directive Suggestion. Apparatus. As in Test 42, save that only 60 mm. lines are used.

Method. Seat S 50 cm. from the cardboard screen and provide him with a sheet of cross-section paper. Instruct him as follows: "I'm going to show you a number of lines. You will see them appear through this slit, one at a time. When I show you a line, take a good look at it; then make a mark on this paper at just the distance from this edge (left-hand) that the line is long. When that is done, I shall show you the second, then the third, and so on. You will make the mark for the length of the second line on the second line of your paper, for the third on the next line, and so on." E now displays the 5th, *i.e.* the first 60 mm. line of the series, with the remark: "Here is the first one." When S is ready for the second line, *i.e.* 7-10 sec. later, E remarks, as he exposes it: "Here is a longer one." When the third is exposed he remarks, "Here is a shorter one," and he continues to use these remarks, alternately, at the moment of exposure of each line, until 15 lines have been exposed, the first without suggestion, the remainder coupled with 14 suggestions — 7 of shorter, 7 of longer. These suggestions must be given just before the line is exposed, in a quiet tone, without looking at S. S should see the disk turn and the new line appear at the moment that he receives the suggestion. . . .

Results. (1) . . . Sixteen of 23 pupils tested by Binet submitted completely to the suggestion, and no one resisted every suggestion. . . . (4) There are marked individual differences in the suggestibility of school children under the conditions of this test. Binet found that in 18 trials the number of resistances to suggestion ranged from 0 to 14. . . .

[Reverting to the effect of suggestion on the correctness of reports in general, as observed in experiments with a colored picture [*post*, No. 290], the following generalizations have been made:]

(11) *Dependence on Form of Report.* All authorities agree that the use of the interrogatory,¹ whether the complete or incomplete form, increases the range and decreases the accuracy of the report.¹ Thus, in comparison with the narrative,¹ the range of the interrogatory may be 50 per cent greater, while the inaccuracy (of the incomplete interrogatory) may be as much as 550 per cent greater. In general terms we may say that about one tenth of the narrative is inexact, but about one quarter of the interrogatory. . . .

(12) *Dependence on the Type of Question.* The introduction of leading or suggestive questions very noticeably decreases the accuracy of report for children, and, unless the conditions of report are quite favorable, even for adults. The greater suggestibility of children is shown by Stern's results, in which the inaccuracy of boys and girls aged 7 to 14 was from 32 to 39 per cent, as against 10 per cent inaccuracy for young men aged 16 to 19 years.

258. JAMES RAM. *On Facts as Subjects of Inquiry by a Jury.* (3d Amer. ed. 1873. p. 134.) A witness about to narrate facts may be left to tell his story in his own way, or it may be drawn from him by questions put to him.

The former method of telling the story is open to these objections: The witness may not think enough to call to mind all he can relate; from care-

¹ [For the technical meaning of these terms with this author, see *post*, No. 290. — Ed.]

lessness or oversight he may omit to mention some circumstances; he may think or fancy the circumstances he withholds are not material to a proper understanding of his story; indeed, he may think or fancy that his story will be best understood, if it be not loaded with matters which he views as redundant, but which nevertheless are essential to see the facts in their proper proportions and color. . . . Supposing, besides, the witness does not wish to speak the whole truth, it is obvious his wish will be promoted, by leaving him to tell his tale in his own way. . . .

In the other method of obtaining a relation of facts, the one by question and answer, the object of the interrogator is, to get from the witness all he himself saw, heard, said, and did, excluding all hearsay, and other irrelevant matter. And the questions being framed with a view to this exclusion, if the witness confines himself strictly to the questions addressed to him, his answers will contain no hearsay nor other irrelevant matter. But as, according to this method, the witness's narrative consists solely of his answers to the questions put to him, this obvious inconvenience attends it, that if all the questions required to bring out the witness's whole story are not put to him, he may in his evidence leave out circumstances important to be known. . . .

The basis of interrogation of a witness is something of which his examiner desires to be informed, and which he knows, thinks, assumes, or hopes, the witness will be able to tell him. There are two ways of questioning: one where the words made use of in the question suggest or prompt a particular answer, and which is called a *leading* question; the other, where the question does not so lead, but is put in general terms, without at all pointing to a particular reply. This may be called an *open* question; it is open to any answer. "Did not you see this?" or "Did not you hear that?" are leading questions. In them the person questioned is in a manner prompted to answer, he did see or hear this or that particular thing. "It is a good point of cunning for a man to shape the answer he would have in his own words and propositions: for it makes the other party stick the less."¹ "Ye will, therefore (addressing Morris), please tell Mr. Justice Inglewood, whether we did not travel several miles together on the road, in consequence of your own anxious request and suggestion, reiterated once and again, baith on the evening that we were at Northallerton, and there declined by me, but afterward accepted, when I overtook ye on the road near Clobery Allers, and was prevailed on by you to resign my ain intentions of proceeding to Rothbury; and, for my misfortune, to accompany you on your proposed route. 'It's a melancholy truth,' answered Morris, holding down his head, as he gave this general assent to the long and leading question which Campbell put to him."² Assuming that the person questioned honestly desires to speak the truth, and that his memory is not defective, a strong probability is that, whether the question be open or leading, he will return precisely the same answer to it.

Each kind of question has, however, its advantages and disadvantages. If the witness be dishonest, and there be connivance between him and his interrogator; or supposing the former honest, and the latter not to be so; it is plain that a leading question may tend to bring out the answer which the interrogator desires. And assuming that both the witness and the

¹ Bacon's *Essays: Of Cunning*.

² *Rob Roy*.

interrogator are honest, both wishing the truth to be spoken; here, if the witness remembers little or nothing, or if he be dull, or heedless, or be confused, or embarrassed by timidity or any other cause, there is danger that, if he is addressed by a leading question, he may, without thought or consideration, echo in his reply the words put in the question, and so fail to speak the truth.

An open question imposes on an honest witness the necessity of thought, a consideration of both the question and reply. It forces him to resort to, and, if need be, to ransack his memory, and obliges him to utter only what he remembers. On the other hand, it is very possible, in many cases probable, that from sickness, old age, or other cause, his memory may be so infirm that he cannot be brought to a correct answer, except by a leading question. All open questions, every question short of a leading one, may fail to quicken his memory, and bring him to express the fact of which he has knowledge. Nothing, for instance, is more common, than to forget a person's name, and, without hearing it again, to be quite unable to call it to mind. We constantly hear people say, "If I heard his name, I should know it directly." If the name be pronounced, the hearing of it refreshes the power of recollection, and the name is instantly remembered.

259. CHARLES C. MOORE. *A Treatise on Facts, or the Weight and Value of Evidence*. (1908. Vol. II, §§699, 814, etc.) . . . *Leading Questions*. Lord Bacon said: "It is a good point of cunning for a man to shape the answer he would have in his own words, for it makes the other party stick the less." A leading question propounded to a witness may, by creating an inference in his mind, cause him to testify in accordance with the suggestion conveyed by the question; his answer may be "rather an echo to the question" than a genuine recollection of events, and in some cases may alone be inadequate to support a verdict or decree. Professor Kuhlmann gives the results of some laboratory experiments by Lipmann, and says they "leave no doubt that memory illusion is greater when the statements made are answers to particular questions, than when the statements are made spontaneously on the part of the subject without special questioning." In an article elsewhere cited Professor Claparède says: "In the giving of evidence suggestion plays a most important part. The simple fact of questioning a witness, of pressing him to answer, enormously increases the risk of errors in his evidence. The form of the question also influences the value of the reply that is made to it. Let us suppose, for instance, that some persons are questioned about the color of a certain dog. The replies are likely to be much more correct if we ask the witnesses, 'What is (was) the color of the dog?' than if we were to say to them, 'Was the dog white, or was it brown?' The question will be positively suggestive if we ask, 'Was the dog white?' To such a question the answer is probably of no value. In questioning witnesses — that is to say, in pressing them and forcing their memory — we may obtain, it is true, a much more extensive deposition than if we leave them free to answer spontaneously. Any advantage thus obtained, however, is problematical, since we lose in fidelity whatever we may gain in extent of information." . . .

Leading questions do, however, often stimulate genuine recollection. But if counsel are permitted to so frame a question put to their own witness as

to suggest the answer desired, there is always imminent danger of getting before the jury the phrases and ideas not really those of the witness. Comparatively small weight, in any case, is due to testimony as to critical facts, elicited from a friendly witness under strenuous pressure of leading questions by counsel for the party on whose behalf he testifies. . . .

260. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹ *Assuming a Controverted Fact*. A question which in part assumes the truth of a controverted fact may lead a witness to reply without taking care to specify that his answer is based on that assumption, and may thus commit him to an assertion of the assumed fact, though in fact he may not desire or be able to do so. This is obviously a danger to be prevented:

1888. *Parnell Commission's Proceedings*. 19th day, Times' Rep., pt. 5, p. 221; the "Times" having charged the Irish Land League with complicity in crime and outrage, a constable testifying to outrages was cross-examined by the opponents as to his partisan employment by the "Times" in procuring its evidence; Mr. Lockwood: "How long have you been engaged in getting up the case for 'The Times'?" Sir H. James: "What I object to is that Mr. Lockwood, without having any foundation for it, should ask the witness 'How long have you been engaged in getting up the case for 'The Times'?' " Mr. Lockwood: "I will not argue with my learned friend as to the exact form of the question, but I submit that it is perfectly proper and regular. If the man has not been engaged in getting up the case for 'The Times,' he can say so;" Sir H. James: "I submit that my learned friend has no right to put this question without foundation. Counsel has no right to say 'When did you murder A. B.?' unless there is some foundation for the question. In this same way he has no right to ask 'How long have you been engaged in getting up this case?' for it assumes the fact." . . . President Hannen: "I do not consider that Mr. Lockwood was entitled to put the question in that form and to assume that the witness has been employed by 'The Times.'" ²

261. FRANCIS L. WELLMAN. *Day in Court*. (1910. p. 79.) The rule against leading questions (with few exceptions) is strictly adhered to, and very properly so. Some lawyers put the clearly inadmissible question which suggests the answer, and though it is ruled out, perhaps with a rebuke from the court, the witness nevertheless has caught the idea. This is disreputable practice. . . . Every advocate is in honor bound not to transgress the rule against "leading questions" when it really comes to important matters.

But it is sometimes extremely difficult. Indeed, there are cases in which the Court, in its discretion, may permit him to ask leading questions in the interests of justice, so that important testimony may not be lost. Suppose, for instance, a witness is giving his memory of a long conversation he overheard between the parties to an action, and, as often happens, leaves out of his narrative perhaps what, in law, amounts to the most important part. In vain the advocate tries not to lead him. He asks, "Have you given all

¹ [Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, § 771.)]

² The following anecdote neatly illustrates this trick of a "loaded" or "forked" question: "Sir Frank Lockwood was once engaged in a case in which Sir Charles Russell (the late Lord Chief Justice of England) was the opposing counsel. Sir Charles was trying to browbeat a witness into giving a direct answer, 'Yes,' or 'No.' 'You can answer any question yes or no,' declared Sir Charles. 'Oh, can you?' retorted Lockwood. 'May I ask if you have left off beating your wife?'" (*Green Bag*, Vol. XII, p. 671.)

the conversation?" "Was that all that was said?" The witness remembers no more. The memory of the witness had been exhausted by direct questions, and then the Court may properly permit him to lead the witness so far as to ask the witness whether anything was said about so and so (without suggesting what was said), and thus call his attention to the matter which the witness had inadvertently overlooked, and thus save very important testimony which should otherwise be lost.

So, too, when it is discovered that a witness is *hostile*, the Court, as already intimated, may permit leading questions to be put, because the reason for the rule against them no longer exists. In other words, the rule against putting leading questions to your own witness is based upon the tendency of the human mind to adopt the suggestion of the person or side that it desires to aid and to quickly respond to any hint of what is wanted to assist the party making the suggestion. Hence, in the case of a hostile witness obviously the reason for the rule is gone.

262. PAT HOGAN'S CASE. (J. RODERICK O'FLANAGAN. *The Irish Bar*. 1879. p. 238.)

. . . O'Connell defended a man named Hogan, charged with murder. A hat, believed to be the prisoner's, was found close to the body of the murdered man, and this was the principal ground for supposing Hogan was the perpetrator of the foul deed. That the deceased came by his death by violence, the state of the body clearly showed; and O'Connell felt the case for the prisoner required the exercise of his utmost powers. The Crown counsel made a strong point on the hat, which was produced in court. O'Connell cross-examined the neighbor of the prisoner, who identified it.

"It is not different from other hats," said O'Connell.

A. "Well, seemingly, but I know the hat."

"Are you perfectly sure that this was the hat found near the body?"

A. "Sartin sure."

O'Connell proceeded to inspect the caubeen, and turned up the lining as he peered into the interior.

Q. "Was the prisoner's name PAT HOGAN" (he spelled each letter slowly) "in it at the time you found it?"

A. "'Twas, of coorse."

Q. "You could not be mistaken?"

A. "No, sir."

Q. "And all you swore is as true as that?"

A. "Quite."

"Then go off the table this minute!" cried O'Connell, triumphantly. Addressing the Judge, he said, "My Lord, there can be no conviction here. *There is no name in the hat!*"

The prisoner was at once acquitted.

263. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹ Repeating precisely the *same question on cross-examination*, in order by sheer moral force to compel a witness to admit the truth, after an *original false answer or refusal to answer* is a process which not only savors of intimidation and browbeating, but also tends to waste time. Accordingly, it is not doubtful that the trial Court has discretion to refuse or to allow this, as seems best under the circumstances. Nevertheless, when used sparingly

¹ [Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, § 782.)]

and against a witness who in the cross-examiner's belief is falsifying, there ought to be no judicial interference; for there is perhaps none of the lesser expedients (that is, ranking after Cross-examination and Sequestration) which has so keen and striking an efficacy, when employed by skillful hands, in extracting the truth and exposing a lie. Simple as this expedient seems, it rests on a deep moral basis; and the annals of our trials demonstrate its power. In the following passages, ranging over three centuries, some of the most notable illustrations will be found:

Count Coningsmark's Trial. (1682. 9 How. St. Tr. 1, 55.) [The Count, charged with murder, was said to have absconded in disguise; and a Swedish fellow countryman of his, at whose house he had changed his clothes, was called]: Q. "Pray, what did the Count say to you about his coming in disguise to your house?" A. "He said nothing, but that he was desirous to go to Gravesend; . . . I helped him to a coat, stocking, and shoes." Q. "Then I ask you, what did he declare to you?" A. "Why, he did desire to have those clothes." Q. "You are an honest man, tell the truth." A. "He declared nothing to me." Q. "Did he desire you to let him have your clothes because he was in trouble?" A. "He desired a coat of me, and a pair of stockings to keep his legs warm." Q. "I do ask you, did he declare the reason why he would have those cloaths was because he would not be known?" A. "*He said he was afraid of coming into trouble.*" Q. "Why were you unwilling to tell this?"

Lord Baltimore's Trial. (1768. Gurney's Rep. 77.) [Abduction and rape of Sarah Woodcock; the testimony showed plainly that the case was in truth one of willing seduction, although the complainant testified flatly to the use of force and coercion; her evidence was suspiciously inconsistent, and, on her cross-examination by the accused himself, the following answers were elicited:] Q. "How old are you?" A. "I am twenty-seven." Q. "Will you swear you are no older?" A. "I will swear I am twenty-eight." Q. "Will you swear you are no older?" A. "I will swear I am that." Q. "Will you swear you are no older?" A. "I do not know I need tell; I am twenty-nine, and that is my age; I cannot exactly tell." Q. "To the best of your belief, how old are you?" A. "*I believe I am thirty next July; I cannot be sure of that, whether I am or no.*"

Horton's Trial. (1784. Sel. Crim. Trials at Old Bailey, I, 456.) [The accused, aged 11, was indicted for felonious larceny; and one Isaac Barney, a patrolman, swore to a confession by the boy when under arrest that he had watched while two men entered the house; the following comprised the entire cross-examination of this witness]: *Counsel*: "You had frightened this poor child out of his senses?" *Witness*: "I do not think he was afraid." *Counsel*: "Do you know what reward there is for the conviction of this poor infant?" *Witness*: "Upon my oath I do not know." *Counsel*: "Do you mean to say that you, a patrol, do not know?" *Witness*: "I am sure it is a thing I never had." *Counsel*: "You shall not slip through my fingers so." *Witness*: "Upon my word and honor I do not know." *Counsel*: "Upon your oath, sir?" *Witness*: "I do not." *Counsel*: "Did you never hear that there was a reward of forty pounds upon the conviction of that child?" *Witness*: "I never knew any such thing." *Counsel*: "But you have *heard* it?" *Witness*: "I never heard any such thing." *Counsel*: "Come, come, sir, it is a fair question, and the jury see and hear you. Upon your oath, did you never hear that you would be entitled to forty pounds as the price of that poor infant's blood?" *Witness*: "Your honor, I cannot say." *Counsel*: "But you *shall* say before you leave that place." *Witness*: "*I have heard other people talking about such things.*" *Counsel*: "So I thought; and with that answer I leave your testimony with the jury."

Queen Caroline's Trial. (1820. Linn's ed., I, 48, 78.) [In attempting to prove an act of adultery at Naples, between the Queen and her servant Bergami, one of the material facts alleged by the prosecution was that the Queen's sleeping room adjoined

Bergami's, with only a corridor and a cabinet intervening, and that there was no access from the Queen's room to Bergami's except by that passage; to this the servant *Majocchi*, who for a time slept in the cabinet mentioned, testified as follows, on being asked by Mr. Solicitor-General *Copley* (afterwards L. C. Lyndhurst) whether there was no other intervening passage]: "There was nothing else. One was obliged to pass through the corridor, from the corridor to the cabinet, and from the cabinet into the room of Bergami. There was nothing else." Then, on his cross-examination, Mr. *Brougham* asked as follows: "Will you swear there was no passage by which her Royal Highness could enter Bergami's room, when he was confined with his illness, except going through the room [*i.e.* cabinet] where you slept?" *Majocchi*: "I have seen that passage; other passages I have not seen." Mr. *Brougham*: "Will you swear there was no other passage?" *Majocchi*: "There was a great saloon, after which there came the room of her Royal Highness, after which there was a little corridor, and so you passed into the cabinet. I have seen no other passage." Mr. *Brougham*: "Will you swear there was no other passage?" *Majocchi*: "I cannot swear; I have seen no other but this; and I cannot say there was any other but this." Mr. *Brougham*: "Will you swear that there was no other way by which any person going into Bergami's room could go, except by passing through the cabinet?" *Majocchi*: "I cannot swear that there is another; I have seen but that; there might have been, but I have not seen any, and I cannot assert but that alone." Mr. *Brougham*: "Will you swear that if a person wished to go from the Princess's [*i.e.* Queen's] room to Bergami's room, he or she could not go any other way than through the cabinet in which you slept?" *Majocchi*: "*There was another passage to go into the room of Bergami.*" Mr. *Brougham*: "Without passing through the cabinet where you slept?" *Majocchi*: "Yes."

264. CHARLES C. MOORE. *A Treatise on Facts, or The Weight and Value of Evidence*. (1908. Vol. II, §§ 699, 814, etc.) *Memory Refreshed or Revived by Memorandum*. . . . We have elsewhere seen how readily imagination and inference produce false recollection. This facility often makes it extremely difficult for judges to arrive at satisfactory conclusions, because, in many cases, witnesses do really, by attentive and careful recollection, recall the memory of facts which had faded away, and were not, when first questioned, present to their minds. . . . A memorandum, however, may exert an improper control over the recollection of a witness, instead of merely refreshing his memory. We have already seen that the memory of an interested witness tends to favor himself. . . . Where a party testified in his own interest to a transaction of remote date, and the written evidence thereof favored his statement, the Court observed that "the witness would naturally rely more on the written papers as to what the transaction really was, than on any obscure or imperfect recollections of anything differing from them;" for example, it would not be singular if, looking at a deed to himself, absolute on its face, he should forget or deny a contemporaneous understanding that it was a mortgage. In a collision case between vessels some of the seamen testified, several months after the collision, as to the direction of the wind, their testimony in that regard agreeing with an entry in the log kept by the master. But it was found that the original entry had been obliterated by another entry in a different ink. The Court said it was most reasonable to believe that the altered log had been shown to the witnesses, and had led their recollection into the error committed in the fabricated entry.

265. JOHN H. WIGMORE. *Principles of Judicial Proof*. (1913.)¹ *Prepared Deposition*. Since the witness' statement must correspond spontaneously to his actual recollection, it is plain that to permit him to *commit to writing beforehand* certain statements and then to read them or hand them in as his testimony would be to abandon all safeguard against fabrication and to make possible any manner of pretended testimony. This mode of furnishing testimony is universally prohibited. It is of course to be distinguished from the use of writings which genuinely revive a present recollection or record a past recollection. Indeed the object of the restrictions placed upon those two uses of writing is chiefly to insure that they are not writings of the prohibited and improper sort. The distinction is a clear one, namely, between writings which frankly purport to be used to aid memory (in which they are to be tested by the appropriate restrictions) and writings which do not purport to be so used; the latter falling within the present prohibition:

ELDON, L. C., in *Shaw v. Lindsey*. (1808. 15 Ves. Jr. 380, 381): "Upon general principals nothing is more clear than that a witness before commissioners cannot be examined in such a manner that the effect is, not his testimony given in answer to interrogatories, but (as it is termed) filing an affidavit. . . . All courts of justice are extremely anxious to secure the pure examination of witnesses by not permitting that mode of examination which could lead to infinite mischief. Many instances have occurred of a witness coming into court holding in his hand an answer which he has conscientiously framed as his answer to interrogatories, with the substance of which he may be acquainted, — the answer of an honest, conscientious man, and the value of his testimony perhaps not diminished by his anxiety to be correct. Yet courts of law and equity, with the view of excluding general mischief, concur in refusing to allow it. . . . The habitual practice of law, upon an examination *viva voce* is not to permit any suggestion to the witness by the attorney, counsel, or any other person; the same strictness prevails in this court, where the extent of mischievous management that would ensue, if a witness should be permitted to go before commissioners with a prepared deposition, is obvious."

KENT, C., in *Underhill v. Van Cortlandt*. (1817. 2 Johns. Ch. 339, 346): "He went before the examiner with a prepared deposition. This is against the course and policy of the court, and it would lead to the most dangerous practices. The witness should go before the examiner, as Lord Coke observes, 'untaught and without instruction.' He should be free to answer the sifting interrogatories that are framed for the issue in that case, instead of merely filing an affidavit ready drawn."

266. BROWN *v.* BRAMBLE. (PETER HARVEY. *Reminiscences of Daniel Webster*. 1901. p. 67.)

One Brown had taken from one Bramble a bond to pay said Brown \$100 a year for life. After a while Bramble began to persuade Brown to cancel said bond for a definite sum, but Brown would always refuse. It was Bramble's custom to indorse the annual payments on the bond. At next payment Bramble indorsed, not \$100, but \$1000 as paid on the bond, adding,

"in full consideration of and canceling this bond." Brown, not being able to read or write, signed the indorsement by making his mark, and the bond was kept by him. When Brown demanded payment the following year, the other contended that he owed nothing, citing the indorsement of the previous year. Brown consulted Mason, but finding him retained by

¹ [Adapted from the same author's *Treatise on Evidence*. (1905. Vol. I, § 787.)]

Bramble, went with his story to Webster, who, putting faith in his story, entered into the fight, which came on at Exeter, New Hampshire. There was at that trial a witness for Bramble by the name of Lovejoy, who, it appears, was a "chronic" witness, appearing in nearly every case held in the neighborhood. A friend of Brown, seeing Bramble in conversation with Lovejoy, noticed that the former gave to Lovejoy a paper, and informed Webster of the fact just before the trial. Lovejoy's testimony seeming to Webster somewhat unnatural, Webster came to the conclusion that said paper given by Bramble must contain the evidence, or rather testimony, which

Lovejoy was supposed to give. Webster says: "There sat Mason, full of assurance, and for a moment I hesitated. Now, I thought, I will make a spoon or spoil a horn. I took the pen from behind my ear, drew myself up, and marched outside of the box to the witness stand. 'Sir,' I exclaimed to Lovejoy, 'give me the paper from which you are testifying!' In an instant he pulled it out of his pocket; but before he had it quite out he hesitated, and attempted to put it back. I seized it in triumph. *There was his testimony in Bramble's handwriting!*"

The end was that the case was settled on terms dictated by Webster.

267. CHARLES C. MOORE. *A Treatise on Facts, or The Weight and Value of Evidence*. (1908. Vol. II, §§ 699, 814, 828, 836, 838, 1268.) *Prepossession [Autosuggestion] causing Error in Observation*. . . . Froude says: "In certain conditions of mind the distinction between objective and subjective truth has no existence. An impression is created that it is fit, right, or likely that certain things should take place, and the outward fact is assumed to correspond with that impression." The effect of prepossession, of which interesting illustrations relating to both observation and memory are found in various places in this work, was strikingly stated by Mr. Justice Grier. "Tell a man that a person's name with which he is acquainted has been forged," said he, "and nine cases out of ten, he will be astute enough to fancy he discovers some marks of it." Belief that there were such creatures as witches, which obsessed the witnesses for the prosecution in the old witchcraft cases, undoubtedly caused frightful errors in their testimony to what they had seen. An observer's false preconceived conclusion may cause him to testify erroneously to the identity of persons or objects that he has seen. If a man believed that another man introduced to him by a woman was her husband, it would not be strange if he failed to notice that the man was not introduced as her husband, and if he subsequently testified erroneously on that point. . . . In New York City instances scandalously numerous have occurred where ambulance surgeons, judging from a man's environment or other circumstances, have erroneously diagnosed insensibility caused by a fracture of the skull as a case of alcoholism. In a case in Canada where the plaintiff was severely injured by walking off a sidewalk, the defendant city contended that he was under the influence of liquor at the time; the attendants at a hospital to which he had been immediately taken made such an entry in their records. "Instances of such mistakes are not rare," said Chief Justice Mulock, of Ontario. "The plaintiff a short time before had had a glass of whisky, which, doubtless, would be observable by a person dressing his wounds. He arrived at the hospital in an excited state, doubtless resulting largely, if not wholly, from the accident. His

face was covered with blood, and he was in the company of a policeman. On such evidence the attendants concluded that he was under the influence of liquor. The evidence does not, I think, support such a conclusion." . . .

Witness influenced by hearing Others Testify. The lawyer who has practiced long in jury causes cannot have failed to observe that the practice of permitting witnesses to hear each other's testimony has often resulted in a great and gross abuse of public justice. Human nature is frail, and that frailty is as often illustrated in the witness box as elsewhere. The witness in an excited litigation often becomes the mere partisan of the litigant whose cause he represents. His solicitude in the cause, and his anxiety to win the verdict, are often no less than those of his friend and summoner, whose life, liberty, or property may depend upon that verdict. He comes to regard the adverse party and the adverse witnesses as his adversaries, and often, with scarce a consciousness of the serious obligation that is upon him, lapses into the conviction that the scene before him is a mere tilt and tourney in which he enters to overturn and countervail the testimony of the adverse party. He has heard the evidence of his own party in regard to the transaction, and perhaps he remembers it somewhat differently; but a conflict would be fatal; and he often reasons his flexible conscience into the opinion that his own memory is at fault, and the statement of his confederate is the true version, and he therefore corroborates it. He has heard the testimony of the adverse party, and his ingenuity is taxed at once to strike it where it is vulnerable, and to destroy it. . . . The purpose to be subserved in putting witnesses "under the rule" [by separating them during each other's testimony] is that they may not be able to strengthen or color their own testimony, or to testify to greater advantage in line with their bias, or to have their memories refreshed, sometimes unduly, by hearing the testimony of other witnesses. . . .

Tutored Witnesses. The mere fact that attorneys at law, in preparing their case for trial, have talked with a witness, should not be presented to the jury as ground for discrediting such witness, for it is the duty of the attorney to learn from witnesses what testimony they can give, in order to enable him to conduct the trial on his part with expedition. To endeavor to learn from a witness, for the first time, on the witness stand, whether he knows anything of the facts at issue, would involve a needless waste of the time of the court. Nevertheless, the substance of conversation had before the trial, between the witness and the attorney or others, in relation to the testimony to be given, is proper subject of inquiry and within the field of legitimate cross-examination, and it may be that the trier of facts will receive a strong impression that the vague and indistinct recollection of a witness has been pointed for the purposes of the case by the suggestions of counsel — that the latter controlled and mastered the memory of the witness. . . . Courts look with great suspicion upon the testimony of witnesses when there is reason to believe that they have been willing pupils diligently instructed by interested parties how to make their several testimonies fit in with each other so as to give united support to the cause and yet avoid the appearance of confederacy. For example, in considering the course followed to get together a host of witnesses to prove testamentary incapacity in a will case, Sir John Nicholl, who was not only a celebrated jurist, but a magistrate of transcendent sagacity in estimating the value of testimony,

spoke as follows: "A room is taken at 'The Ship in Distress,' a tavern at Horsleydown; there the witnesses attend and are entertained; they talk the matter over, a long bill is incurred, the landlord and landlady are two of the witnesses; Mr. Alderson (an interested party) goes there frequently, and carries his own claret there. How is the court to estimate the degree of reliance to be placed on witnesses so got together and so brought forward?" . . .

268. JOHN C. REED. *Conduct of Lawsuits*. (2d. ed. 1912. § 101). . . . It is also an advantage that [at an early interview] you commit and fasten the witness to his narrative. For sometimes a witness is wavering. When the transaction is fresh, he is full of nothing but its actual details, but frequently he is disposed afterwards to alter his first report. He may begin to recoil from the effect of his testimony upon the interest or feelings of the opposite party and his relatives and friends, and he is usually influenced by their appeals and solicitations. All of us have observed that the testimony of good men is shaped and colored by their associates. You will sometimes find that the others, while testifying to the same facts, repeat many particulars of the first witness, although they may have been excluded from court during his examination. This is because they have talked over the matter together, each desiring to avoid being contradicted by the rest. Many times the others labor to reproduce the narrative of the one of most intelligence and standing; and he may be strongly biased, for all of his seeming frankness. You have a multitude of reasons for being in haste to make your slippery witness sure and steadfast.

269. FRANCIS L. WELLMAN. *Day in Court*. (1910. p. 79). . . . The advocate should get his client to bring his witnesses to him at once; should take their stories in detail, squeeze them dry of information; and be careful not to suggest any answers by his questions. He should always bear in mind that the same witness in the quiet of a lawyer's office, where he may want to appear important as well as obliging, is apt to tell an entirely different story from the one he will stick to when he takes his oath in a court room in the presence of the judge, jury, and audience, especially if he has heard other witnesses broken down by cross-examination. Unless an advocate is careful, therefore, when he takes a witness's statement in his office, he will be entirely deceived by him. Nearly every witness is prone to exaggeration and can be easily encouraged to state as facts matters that are merely hearsay or his own inference. Lawyers themselves are in a large measure to blame for this state of things because they lead and push a witness too far. . . .

There is a great difference between "coaching" a witness and preparing him for the witness stand. If a witness is "coached," he is apt to be led to perjury, but if he is merely prepared, then, in my judgment, the cause of truth is advanced. Why should a timid, nervous witness be left to the tender mercies of the opposing lawyer without a word of advice? . . . There is nothing so annoying as a fool in the witness box, especially when the examiner knows the man who is making a fool of himself is really telling the literal truth. Why not remind a witness to keep his temper, to speak slowly and distinctly, to be respectful to the court and the opposing lawyer? Why

not caution him not to try to be "smart" or flippant in his replies? Why not caution him that he should carefully understand a question before he attempts to answer it; to try to make his answers short and responsive, and not volunteer matters about which he is not questioned? . . . Why should not an advocate test his own witnesses by cross-examination beforehand in his office? It often relieves their minds very much, because they not infrequently are afraid that when they mount the witness stand, their whole past will be raked up by the cross-examiner, and this fear often makes them hesitate to tell all they really know. Such a rehearsal is good for the examining counsel as well. It teaches him how to manage and handle his own witnesses when he reaches the court room, and if he is careful to confine these rehearsals to the manner only and not the matter of the testimony, he will find them of the greatest service at the trial, both to himself as well as the cause he represents. . . .

270. ARTHUR C. TRAIN. *The Prisoner at the Bar*. (2d ed. 1908. p. 233.) What the witness frequently does is to discuss the matter with his friends who were present on the occasion in question, and, as it were, form a sort of "pool" of their common recollections, impressions, and beliefs. One suggestion corrects or modifies another until a comparatively lucid and logical story is evoked. When this has been accomplished the witness mentally exclaims: "Of course! That was just the way it was! Now I remember it all!" The time is so distant that whatever the final crystallization of the matter may be, it is far from likely that it will thereafter be shown to be inaccurate by any piece of evidence which will present itself to the witness and his friends. The account thus developed by mutual questions and "refreshing" of each other's recollection becomes, so far as the parties to it are concerned, *the fact*. The witness is now positive that he did and said exactly so and so, and nothing will swerve him from it, for inherently there is nothing in the story or its make-up that affords any reason for questioning its accuracy. This story repeated from time to time becomes one of the most vivid things in the witness's mental experience. He repeats it over and over, is cross-examined by his own attorney upon it, incorporates it in an affidavit to which he swears, and when he takes the stand recounts these ancient happenings with an aggressiveness and enthusiasm that bring dismay to the other side.

But what a farce to call this recollection! What is this circumstantial romance when it comes to be analyzed? Jones, a friend of Smith the prospective witness, is anxious to establish an alibi, and asks Smith if he doesn't remember meeting him in the club on February 12, two years before. Smith has no recollection of it at all, but Jones says: "Oh, yes, you were going to the theater with Robinson." Of course, if Jones is so sure, Smith naturally begins to think it is probably the fact, and he does remember vaguely that he and Robinson spent an evening together. So he consults his diary and finds it recorded there that he did attend the theater on the day in question with Robinson. He does not remember the play, but Robinson recalls that it was "The Chinese Honeymoon," and believes that they dined together first at the club. Smith now thinks he remembers this himself. Then Robinson suggests that they probably went to the theater in a cab. They look in a file of old papers and find that it was raining. That settles

it — of *course*, they went in a cab. The next question is the hour. They have no recollection of being late, so they must have arrived on time. Well, the paper says the play commenced at eight, and it takes a cab about twenty minutes to get from the club to Daly's Theater, so it is reasonably clear that they must have started a little before eight. Smith unconsciously is persuaded to believe that if Jones was right about their going to the theater, he *must* also have been in the club at the time he says he was there. Both he and Robinson recall that Jones was always hanging round the club two years ago, and as neither can remember an evening when he wasn't there, they decide he must have been there *that* night. Robinson has a dim recollection that they had a drink together. That is a pretty safe guess and has all the air of verisimilitude. In an hour or two Smith is ready to swear positively from *recollection* that he dined with Robinson at the club on February 12, two years ago, met Jones, had a drink with him, that this occurred at seven fifty-five, that it was raining, that they took a cab, etc. In its elements this testimony is entirely hearsay upon the only vital point, *i.e.* Jones's presence in the club at that time, and the immaterial remainder is made up of equal parts of diary, newspaper, playbill, weather report, usual custom, reliance on Robinson's alleged recollection, and belief in Jones's innocence. He has practically no actual memory of the facts at all, and the only thing he really does remember is that a long time ago he did attend some theater with Robinson.

271. THE HOSPITAL CASE. (FRANCIS L. WELLMAN. *Day in Court*. 1910. p. 79.)

... One of the most remarkable cases of suggestive evidence came under my own observation some years ago when I was defending one of the nurses of the Mills Training School — a most estimable young man — who had been indicted for deliberately choking to death a patient in the Insane Ward at Bellevue Hospital. A reporter of the *Journal* had made a contract with his newspaper for \$150 to feign insanity and get himself committed to the insane ward at Bellevue Hospital for the purpose of writing an article upon the treatment of the insane for publication in the *Journal*. During his first night in the hospital one of its patients died, and the reporter conceived the idea of weaving around this occurrence a tragic (though false) story of the abuse of the insane, resulting in death. In his article he claimed to have seen two trained nurses (one of whom was this young man) strangle this patient to death because he would not eat

his supper. He graphically described how these nurses had wound a towel around the insane man's throat and had twisted it until the patient was strangled to death. Newspaper pictures, occupying a full page of the *Journal*, were published, purporting to show all the details of the alleged process, in vogue at the hospital, of strangulation by means of a towel. The indictment of this young man for murder followed the *Journal* exposure of these alleged hospital abuses. The whole community was wrought up to a high pitch of excitement. At the trial the perjury-lying reporter, as a witness for the prosecution, told the same story, but was so thoroughly discredited and brought to bay on the second day of his lengthy cross-examination that he fled the town, writing from Philadelphia to his mother in this city that he dare not ever return to New York. This fact, however, could not be communicated to the

jury, during the trial, still unfinished, and the greatest difficulty to overcome was the fact that *three insane patients* were brought from the same hospital by the Assistant District Attorney, and called as witnesses, and (being found by the court to have sufficient intelligence) were allowed to testify to all the alleged details of the murder as they themselves had witnessed.

All three of these insane patients had seen and studied the pictures and descriptions published in the *Journal*, and these pictorial reproductions of occurrences alleged to have taken place in their own wards at the asylum, had served as such vivid, though false suggestions to their diseased minds (already naturally antagonistic to their keepers and nurses) that they afterwards honestly believed and felt warranted in taking an oath that they themselves had actually witnessed these very occurrences that had also been sworn to by the reporter. These three witnesses — as many people suffering from certain forms of insanity are quite capable of doing

— gave their testimony in the most remarkably graphic and convincing manner, and it made such a profound impression upon the court and jury, and the prosecution was so bitter and determined, that it seemed almost impossible to prevent the conviction of my client. The jurors, however (having been carefully chosen by both sides from a "special panel"), were unusually intelligent and competent to weigh carefully the false (though honest) testimony of these three witnesses against certain scientific and medical testimony offered in behalf of the defense which conclusively showed that the deceased could not have been strangled to death, and this very long trial ended in a prompt acquittal of the defendant. This case is a striking illustration of the dangerous effect of leading and false suggestions upon minds susceptible of such influences, and in this instance came very near resulting in the conviction and possible execution of an entirely innocent and very worthy young man.

272. PUYENBROECK'S CASE. (GUY M. WHIPPLE. *Journal of American Institute of Criminal Law and Criminology*, 1913, Vol. III; summarizing *Les Témoignages d'Enfants dans un Procès Retentissant*, by J. VARENDONCK, in *Archives de Psychologie*, XI; July, 1911, pp. 129–171.)

The district in Belgium in which the crime occurred had been aroused by three previous similar crimes — violation and murder of young girls — committed within a single month. When the 9-year-old Cecile De Bruycker (*C*) was killed on Sunday, June 12, 1910, in daylight and within a short distance of her home, the countryside was in consternation and rage. The child's movements were known up to 4 o'clock, when she was playing with two other little girls, and the crime was committed between 4 and 5 o'clock. On her failure to return home, her mother, after futile search, went to the homes of her playmates, Louise Van de Stuyft (*L*), aged 10, and

Louisa Van Puyenbroeck (*L. V. P.*), aged 8. These girls were awakened from sleep and stated: "*C* played with us, but *we haven't seen her since.*" This declaration constitutes, in the opinion of the author, the only correct statement made by these children. The village was roused, the police summoned. At 3 in the morning, the police commissioner arrived, woke *L* again from sleep and questioned her at length (no record being made of this examination). *L* then conducted him to the place where she last played with *C*. Soon after they discovered *C*'s body a short distance away. So soon as the body was discovered, *L*'s declarations were

extended and amplified: she now stated that "a tall, dark man, with black mustache" had offered *C* a penny to go with him. She (*L*) followed, and soon afterward found *C* dead in the ditch. She ran home, afraid, went to bed that night without mentioning the occurrence, because she was afraid to tell what had happened.

On Wednesday, the police received an anonymous letter asserting that Amand Van Puyenbroeck (*V. P.*) must be the assassin. Thursday the examining magistrate interviewed him and put him under arrest. He was taken by train to the prison in a neighboring town, but at some risk of his life at the hands of an infuriated mob. From this moment, declarations implicating *V. P.* succeeded with striking rapidity and yielded a large amount of circumstantial and hearsay evidence against him.

L, as already noted, was submitted to two examinations by the police commissioner, one just before, and one shortly after the discovery of the body. The next day, June 13th, both *L* and *L. V. P.* were subjected to a third examination, this time at the hands of the examining magistrate. Both children showed glaring discrepancies and alterations from their first and their second declarations. The questions propounded by the magistrate were couched in a highly suggestive form and were based upon the assumption that the first statements of the girls (expressing entire ignorance of the murder) were incorrect. Thus the magistrate said: "You certainly know the assassin, tell me who it was." "I do not know him," replied the child. To which the magistrate said: "Didn't *C* mention the miscreant's name — as Dick, Jan, Francois, or Jules?" The child then evidently chose one of these names to relieve herself from the pressure put upon her, for she made the round-about statement: "Elvire Van Puyenbroeck told me

that *C* had said that the man's name was Jan." Now, later, when Elvire was examined, she asserted that she knew nothing about the affair. "But you must," retorted the magistrate, "for you told *L* that you heard *C* call him Jan."

It was not until after this name had been thus lugged into discussion that the anonymous letter appeared. It must be explained, further, that the accused, Amand *V. P.*, was sometimes known as Jan. Also that he was the father of *L. V. P.*, whose testimony helped to involve him. Rather extraordinary was the fact that the subsequent testimony included the assertion that the "man" stood within 2 meters of the girls when he offered the penny and yet was not recognized by his own daughter or by a neighbor's child. Almost equally extraordinary was the circumstance that, if the later evidence is to be believed, these children, after witnessing the outrageous death of their playmate at the hands of a man they knew, ran away and played for an hour in the street before his house, and then went to bed without mentioning the crime, because they forgot it or because they were afraid (both explanations were made).

Despite these seemingly impossible obstacles in the acceptance of the guilt of *V. P.*, the intense social pressure for the conviction of some one was now focused upon the definite attempt to convict him. The sudden flood of clew and bits of "evidence" which appeared as soon as he was arrested, and which were plainly the product of rumor, imagination, and general excitement, was explained on the ground that "now tongues were released from their previous fear of *V. P.*"

Again, acting on this belief, which was soon universal, that the little girls knew every detail of the crime, there appears on the scene a woman named Dierens, who had semi-official oversight over certain phases

of their religious life. On June 13th, this woman asked *L* who killed *C*, and obtained the response that *L* was then giving, viz.: "A dark man with black mustache," etc. On June 19th, after *V. P.*'s arrest, the woman, after some exhortation, asked this terribly suggestive question: "Now, wasn't it really *V. P.* who killed *C*?" *L* nodded her head faintly. Again the same question, and again *L* nodded her head, but added: "All the boys say so." A third time the question and the same response. Then the woman hastened to report her "success" to the authorities, saying: "*She is weakening and on the point of confessing all.*" It does not need a psychologist to anticipate what followed. The commissioner repaired again to *L*'s house and armed with the woman's statement, proceeded to secure from *L* (and from *L. V. P.*, who had, it may be added, ample opportunity to discuss the testimony with *L*) all the "evidence" desired.

In the trial, which followed in January, 1911, the circumstantial evidence against *V. P.* was successfully met by counterevidence, so that the chief reliance of the prosecution was upon the testimony of the two little girls aforesaid. Counsel for the defense thereupon engaged a number of psychologists to testify to the unreliability of this juvenile testimony. The chief part of this expert testimony was presented by Varendonck, the author of the present article. He had examined, line by line, the voluminous record (nearly 1000 pages) secured in the preliminary hearings and had conducted a series of experiments upon school children, in which, so far as feasible, the nature and form of the questions propounded by the authorities to the girls was reproduced. This he sought to put before the court, together with a general account of the work that had been done by experts in the study of the psychology of testi-

mony. He concluded that the girls had positively not seen the murder or the murderer, and that their testimony was worthless. Varendonck's testimony was the occasion of several violent outbursts of wrath on the part of the court officials, who publicly ridiculed the pretensions of psychologists to dictate to them how questions should be asked or what evidence was reliable. Despite numerous sensational passages-at-arms between the court and the psychologists, the jury was impressed by the arguments and the accused was acquitted.

It remains to cite briefly some of the experimental evidence offered on this occasion. Eighteen 7-year-old pupils were asked the color of the beard of one of the teachers in their building: 16 answered "black"; 2 did not answer; the man has *no* beard. Of 20 8-year-old pupils who replied to a similar query, 19 reported a color; only one said the man had no beard (which was correct). Similar results were obtained from older pupils. In one class, a pupil laughed aloud at the query and exclaimed: "He hasn't any beard." Nevertheless, 12 of the 22 reported a definite color. Again, a teacher of a certain class visited another class, stood before them for 5 minutes, talking and gesticulating, but keeping his hat on. Directly after he left, the teacher of the class obtained, in response to the query: "In which hand did Mr. — hold his hat?" 17 answers of "right," 7 of "left," and only 3 correct answers. Other experiments showed that suggestions of odor or temperature could be easily evoked in school children. Finally, to duplicate the strongly suggestive questions of the magistrate, another experiment was tried with 8-year-old pupils, who gave written answers to the following: "When you were standing in line in the yard, a man came up to me, didn't he? You surely know who it was. Write his name on your

paper." Though no one had approached the teacher, 7 of the 22 pupils gave a man's name. The experimenter then continued the test by saying: "Was it not Mr. M——?" to which 17 pupils now answered "Yes." Before a number of lawyers, individual pupils were then subjected to oral examination and gave complete descriptions of the "man's" dress and personal appearance.

It is not surprising that this experimental demonstration of the complete failure of children to withstand the lure of suggestive questions produced a profound effect upon the jury. It is perhaps as little surprising that the legal authorities did not take kindly to the testimony of the psychologists. There is, however, the satisfaction that the study of the psychology of testimony has saved a man from the gallows.

273. G. F. ARNOLD. *Psychology applied to Legal Evidence*. (1906. p. 344.) . . . There is nothing really wonderful in hypnotism: the hypnotic subject is not governed by special psychological laws, but the germs of all his symptoms can be traced in the normal state: the physical disturbance also caused by suggestion has many characters in common with the spontaneous disturbance found in an insane person, and the hallucination of hypnotism does not essentially differ from the ordinary forms of hallucination. The phenomena are only an exaggeration and pathological deviation. The fact that hypnotic patients have displayed extraordinary powers of memory, sensation, and discrimination has tended to give hypnotism an air of the marvelous which has led some people to discredit what they hear of it. Those, however, who have studied the subject explain this by a simple hypothesis which is known as "the principle of *compensation* of functions," according to which the inhibition of the activity of one region is always connected with an increase in the activity of the other interrelated areas.

This interrelation may be either direct (neurodynamic), or indirect (vasomotoric). The first is probably due to the fact that energy which accumulates in one region, as the result of inhibition, is discharged through the connecting fibers into other central regions. The second is due to contraction of the capillaries as a result of inhibition, and a compensating dilation of the blood vessels in other regions. The increased blood supply due to this dilation is in turn attended by an increase in the activity of the region in question. . . . In hypnosis it is possible for different regions within the apperception center itself to be so related that while certain of these regions are partially inhibited, others are correspondingly more open to excitation. . . . In such states of partial hypnosis the subject may carry out in an automatic way complicated acts, all his other functions seeming to be in a waking state. Or he may show certain psychological activities of clearer discrimination, or strikingly exact recognition, or reproduction of certain particular sensations and feelings to the exclusion of all other forms of activity.

The method of producing the hypnotic state is either by fatiguing the senses or by acting on the imagination. . . . It is not necessary that suggestion should always be present: "a whole series of purely physical agents exist, which prove that sleep can be induced without the aid of the subject's imagination, against his will and without his knowledge." At the

same time these cases are rare, and as it is suggestion that is usually employed, it will be well to explain what is meant by this term :

Suggestion uses ideas and the subject's intelligence : it consists in *introducing, cultivating, and confirming, an idea in the mind of the subject of the experiment.* The states it produces are the results of that mental susceptibility, which we all to some degree possess, of yielding assent to outward suggestion, of affirming what we strongly conceive, and of acting in accordance with what we are made to expect.¹ There are as many forms of suggestion as there are modes of entering into relations with another person. Spoken or written suggestion is the simplest. But gestures can be employed, and, though less precise in meaning, suggestion by their means is more intense. Several ways can also be combined. In what is known as autosuggestion, the suggestion has its origin in the subject's intelligence : instead of being the result of an external impression, as in the case of verbal suggestion, it results from an internal impression, such as a fixed idea or delirious conception ; these are often derived from hallucinations. Again, suggestion may produce either an active or impulsive phenomenon, such as a sensation of pain, an act, etc., or a phenomenon of paralysis, *e.g.* loss of memory, anæsthesia : there are different psychological explanations of these two states ; in the former association of ideas is used, in the latter it is supposed that the experimenter produces a mental impression which has an inhibitory effect on one of the sensorial or motor functions. . . .

A further question is how much spontaneity exists in the hypnotic state. The subject is capable of reflecting and reasoning and under the influence of suggestion will himself invent expedients which were not suggested to him, to carry out the order ; also on awaking he imagines his acts were spontaneous and invents reasons of his own for doing them. "Subjects in this condition," says Professor James, "will receive and execute suggestions of crime, and act out a theft, forgery, arson, or murder. A girl will believe that she is married to her hypnotizer, etc. It is unfair, however, to say that, in these cases, the subject is a pure puppet with no spontaneity. His spontaneity is certainly not in abeyance so far as things go which are harmoniously associated with the suggestion given him. He takes the text from his operator ; but he may amplify and develop it enormously as he acts it out. His spontaneity is lost only for those systems of ideas which *conflict* with the suggested delusion. The latter is thus 'systematized' : the rest of consciousness is shut off, excluded, dissociated from it. In extreme cases the rest of the mind would seem to be actually abolished and the hypnotic subject to be literally a changed personality."

As regards the testimony of hypnotized persons as to what happened to them in the hypnotic state, it must first be remarked that, after waking, the subject is still liable to suggestions, which will last if he has been told that he will still see the object, etc., when awake. Though he remains influenced by the hypnotic suggestion, it appears to him to be spontaneous, and he does not remember how the hallucination was produced, nor who gave him the order, nor even that it was given at all ; he will proceed to carry out an act,

¹ Professor James notes that the power of suggestion is insignificant unless the subject is first thrown into the trance-like state, but after that there are no limits to its power : this state has no particular outward symptoms, as the bodily phenomena which are called such are really the products of suggestion, but these suggestions could not have been made successfully without the trance state.

which he has been told to do, and if asked why he does so, will reply that he does not know or will invent some reason. A subject's statement as to the time he has been in the hypnotic sleep can rarely be accepted; he cannot measure the time, as he has no landmark. Nor do the subjects know how often they have been hypnotized, though they sometimes have a general impression about it caused by an impression of cold and shivering. This, however, is not always present and it can be destroyed by suggestion. Sometimes oblivion as to what occurred during the sleeping state is complete, sometimes partial, sometimes the events which occurred during hypnosis recur to the mind with great force, when they are recalled by some external circumstance. No rule can be laid down, as there is every variety of case from the most profound oblivion to the most lucid recollection. If the hypnotizer tells the patient that he will remember nothing on awaking, the suggestion will destroy the subject's recollection of all that has occurred; he may even undergo all sorts of violence and have no remembrance of it. The subject who says he remembers everything cannot be trusted; if he find, *e.g.*, that he has a wound, he is apt to invent an explanation or accept one given him, but in all cases he ends by suggesting to himself that he saw things as he explained them. Or, again, he may err because of the suggestion of the experimenter who has impressed upon him a recollection which is false. If, however, the subject is hypnotized anew, the recollection of all which occurred during the former hypnosis is then revived, if he has received no special suggestion of oblivion; it has been shown, however, that subjects while in a hypnotic state are capable of simulation and of suppressing the truth.

Topic 3. Narration as affected by Typical Temperaments

275. WM. C. ROBINSON. *Forensic Oratory ; a Manual for Advocates.* (1893. p. 126.)

Intelligible Evidence: how Rendered Unintelligible. The Rambling Witness; his Treatment. Testimony in itself intelligible is often rendered difficult of comprehension by the incompleteness, or the want of continuity, with which it is presented. These evils are due either to the defective mental constitution of the witness, or to his moral weakness, or to his personal hostility, or to the improper conduct of the advocate. A defective mental constitution manifests itself in rambling, or in dull and stupid witnesses. In many individuals there apparently exists no power of fixing the attention on a single object and persistently pursuing its consideration, and from such an individual it is useless to expect any exhaustive and coherent statement of the facts within his knowledge. Any idea which suddenly arises in his mind, during the course of his narration, diverts his thought into another channel; he loses sight of many details which he should remember, and continues his relation without consciousness of the omission. If he endeavors to express this new idea, his effort to explain it leads him still further from his proper subject, and when he returns to it, if ever, it is at a point different from that at which it was abandoned, while the intermediate ideas, however necessary to the comprehension of the whole, are left unuttered. The examination of a witness of this defective mental character should be close and catechetical. The questions of the advocate should

lead him step by step through the entire subject of his testimony, in logical order and without omissions. If he persists in rambling and irrelevant replies, he should not be rudely interrupted, for any mental shock or moral perturbation will increase his difficulties, but when he has finished what he wishes to relate, the question from whose true reply he has departed should be patiently repeated, and the examination pass from this point to the next only when the proper answer is obtained.

The Dull and Stupid Witness: his Treatment. The same obstacles are encountered in eliciting the evidence of a dull and stupid witness. His perceptions are cloudy and indefinite. His processes of recollection and reflection are slow and disconnected. . . . The patience of the advocate in this examination must be inexhaustible. To take the witness again and again over his story in order to recall to him some event or fact which seems to elude every effort of his memory, to construct questions which contain some word or phrase suggestive of the missing thought, to contrive methods of explanation or illustration which enable him to make himself clearly understood by the jury, to afford him opportunities for reconciling inconsistencies into which his misapprehension of the questions or the inaccuracy of his replies has led him, taxes the ingenuity and perseverance of the most adroit and indefatigable lawyers. The task imposed upon them is nothing less than the creation of the testimony, save that the facts, as crude and indefinite ideas, lie dormant in the recollection of the witness. It is the advocate who gives to these ideas vitality and form, who clothes them in suitable expressions, who arranges, produces, and communicates them to the jury.

The Timid and Self-conscious Witness: his Treatment. The testimony of a witness whose moral weakness manifests itself in an undue timidity and self-consciousness is subject to the same defects. His attention is divided between the ideas which he is requested to present, and the effect that he supposes is to be produced by their disclosure on himself or on the cause. His apprehensions and conjectures often work through his imagination on his memory, until without intending falsehood he omits or colors facts to a degree irreconcilable with truth. No sooner are his ideas uttered, however, than he becomes conscious of their error. If he now attempts an explanation, it usually results in his entire discomfiture. If he persists in the misrepresentation or concealment, a new cause of embarrassment arises in the fear of subsequent exposure, and leads to still more harmful falsehoods and suppressions. Thus, with the best intentions at the outset, and knowing matters of importance to the cause, a nervous, apprehensive witness may finally retire suspected of the grossest perjury, and without having related a single matter as it actually occurred. No witness who is liable to this infirmity should be permitted to narrate material facts until his embarrassment and fear are overcome. By simple questions in reference to his occupation, residence, or relation to the parties of the cause, eliciting replies in which mistake will be impossible, he should be gradually assured that he is capable of understanding, and of properly responding to, the inquiries which are to be proposed to him, and his entire attention fixed on the proceeding in which he is now engaged. When at last fully at his ease, the more material portions of his evidence should be approached, the questions made, if possible, even more simple and direct, and limiting the answer to the point required. . . .

The Bold and Zealous Witness: his Treatment. The moral weakness of a bold and zealous witness creates almost equal difficulties. He also is self-conscious, but in him self-consciousness is manifested by a high opinion of his discernment of the real requirements of the cause, and of the importance and conclusiveness of his own evidence concerning it. He feels that, if permitted to state fully, in his own way, what he thinks as well as what he knows, the jury must decide at once in favor of the party in whose interest he is called. He rebels at interference, even of his own counsel, is jealous of the questions in reply to which his testimony is delivered, and avails himself of every opportunity to assert his own opinions and escape the limits within which the interrogatories are intended to confine him. He is a dangerous witness, rarely adhering strictly to the truth, easily led astray by flattery, and liable to betray the cause whenever he suspects that his services are unappreciated. This witness requires the most prudent and at the same time the most inflexible control. While he should not be irritated by sensible restrictions, he must still be kept within the narrowest limits, and his evidence confined in matter and expression to the precise truth which it is necessary for him to disclose. . . . The entire examination of this witness should be conducted with a view to the dangers which will attend his cross-examination. Exaggerations in his evidence, which are likely then to be exposed, should be corrected as soon as made, by questions bringing him to some known standard and furnishing a measure of his actual meaning. If he endeavors to conceal unfavorable facts which are certain sometime to appear, such inquiries should be propounded as will now elicit them in the least unfavorable form. . . .

The Hostile Witness: his Treatment. Incompleteness or obscurity in the testimony of a hostile witness is caused by difficulties of an entirely different character. The obstacles encountered in the examination of the rambling, the self-conscious, or the stupid witness arise from intellectual or emotional defects, and can be overcome by enlightening the mind of the witness, or by assisting him to bring his impulses under control. The obstacle encountered in an adverse witness, however, is an antagonistic will. He labors usually under no mental or emotional embarrassments. He knows clearly and precisely the facts which ought to form his evidence. He is able to narrate them positively and coherently, if he so chooses. But, actuated by interest, or partiality, or more secret impulses, he is determined to withhold the knowledge he possesses, or, if compelled to yield it, to communicate it in language which will make it as valueless as possible. Where such a witness is the sole repository of ideas which are essential to the cause, the advocate has no other course than to produce him, and render him as useful as he may. Otherwise, he should avoid him altogether. For it is seldom that the benefit to be derived from such a witness is equal to the injury which his reluctance to assist and his perversion of the facts inflict. When, however, it becomes necessary to improve him, the advocate must first discover the cause and character of his hostility. If it be partial only, manifesting itself toward a single person or a single feature of the cause, it may be possible during the whole examination to ignore the objectionable individuals or issues, and to approach the witness solely upon matter concerning which he will freely testify. If his antagonism extend to the entire cause, or to all the parties by whom he is called, there is little hope of rendering him useful

unless he can be either conciliated, circumvented, or subdued. In order to conciliate him, the weak points in his disposition must be ascertained, and siege laid to his heart by questions which appeal directly to these vulnerable characteristics. Once in a good humor with himself and with the advocate, his motive for concealment or perversion of the truth exercises less influence upon his mind, and he replies with little hesitation to cautious inquiries which do not directly touch his prejudices, or present anew to him the exciting cause of his antagonism. . . .

Classes of Liars: Mode of interrogating them. A witness who is not able, or is not disposed, to tell the truth, fails in the most essential attribute of credibility, and from the moment when this fault becomes apparent to the jury their confidence in him and in his testimony is at an end. Of such witnesses there are three classes: The *innocent* liar, whose imaginations are so intimately mingled with his memories that he does not distinguish between the facts and fancies which occupy his mind, but believes and utters both alike as true; the *careless* liar, whose love of the pathetic or the marvelous, or whose desire to attract attention to himself, overcomes his weak allegiance to the truth, and leads him to weave facts and falsehoods together in his common conversation, to round out his narrations by the insertion of invented incidents, to give dramatic completeness to events by supplying with fiction whatever may be wanting in the circumstance itself; the *willful* liar, who for some definite purpose deliberately asserts what he knows to be untrue. . . . The innocent, imaginative liar is generally endowed with no remarkable astuteness, and, being honest in his intentions, readily follows wherever a kindly questioner may wish to lead him. . . . When he is called upon to state facts, at the instance of the adverse party, the natural desire to serve a friend stimulates his imagination as well as his memory, and the story he relates is the net result of fancy and recollection. The cross-examiner may take advantage of the same docility in order to exhibit to the jury his liability to self-deception. If circumstances which they know did not occur, but which are in keeping with the other parts of the transaction as narrated by him, are now suggested to him, his imagination is very likely to insert them into the picture which his memory preserves, and he will express his certainty of their existence with as much positiveness as that of any other matter to which he has testified. This process may be indefinitely repeated, until the jury see that he is willing to adopt and swear to any details which are not manifestly improbable, or until his contradiction of other witnesses, or of former portions of his own evidence, destroys their faith in his intelligence or honesty. . . . The exposure of the careless liar is a work of little difficulty. The cross-examiner needs but to apply the goad, and give him rein. The same qualities which mislead him in his statements in regard to one event operate on all the occurrences of life, and in his mouth "a little one" always "becomes a thousand," and "two roistering youths" develop into "eleven men in buckram" and "three in Kendal-green." Let fitting incidents, whose details are already accurately before the jury, be but presented to him for description, and his palpable additions and exaggerations will complete his ruin. . . . The willful liar, though probably a rare phenomenon, sometimes appears within our courts, and when he does appear generally eludes or baffles all the artifices of the cross-examiner. . . . An open attack upon a willful liar in order to compel him to confess

his voluntary falsehood is nearly always useless, at least until he has been driven to the wall by a superior foe, or has been reduced to such a state of mental confusion that he is willing to admit whatever the victorious cross-examiner may see fit to demand. His willingness to lie may with more ease and certainty be shown by unveiling the evil motives which impel him, or by entangling him in inconsistencies and contradictions which render it impossible to accept any of his statements as worthy of belief.

276. RICHARD HARRIS. *Hints on Advocacy*. (Amer. ed. 1892. pp. 65, 107.) *The Flippant Witness*. When a witness comes into the box with what is commonly called a "knowing" look, and with a determined pose of the head, as though he would say, "Now, then, Mr. Counselor, I'm your man, tackle me," you may be sure you have a Flippant and masterful being to deal with. He has come determined to answer concisely and sharply; means to say "no" and "yes," and no more; always to be accompanied with a lateral nod, as much as to say, "take that."

But although I have used the masculine pronoun, this witness is very often a female. She has come to show herself off before her friends; she told them last night how she would do it, and feels quite equal to "any counselor as ever wore a wig."

In dealing with this witness, an advocate should carefully abstain from administering rebukes, or attempting "to put the witness down." His object should be to keep her up as much as possible, to encourage that fine frenzied exuberance, which by and bye will most surely damage the case she has come to serve. . . .

You will always approach her as if she were a wild animal ready to tear you if she could get near enough. Therefore, circumvent. You may be sure she will never give an answer that she supposes may be favorable. I have known this kind of witness so "worked up," that at last she has refused to give an answer that she may think favorable even to her own side, for fear it may be made use of somehow by the other.

The Dogged Witness. The dogged witness is the exact opposite of the one I have just been dealing with. He will shake his head rather than say no. As much as to say: "You don't catch me. You see him, gentlemen, and you see me. I'm up to him." He seems always to have the fear of perjury before his eyes, and to know that if he keeps to a nod or a shake of the head, he is safe. He is under the impression that damage the case he must, whatever he says. "A still tongue makes a wise head," has always been his maxim.

How are you to deal with him? . . . Insinuation will help you with this witness. But carefully avoid asking for too much at the time. *Get little answers to little questions*, and you will find as a rule that answers are strung together like a row of beads within the man. . . .

This witness, without being untruthful, is always hostile; he looks on you as a dangerous man, a sort of spy, regards you as he would an ill-looking stranger on a race course who wanted to draw him into conversation. He will become bolder as he proceeds, especially if you prove to him that you are by no means the terrible creature he at first thought you. And the best way to foster this idea is to accustom him to answer. Let him see that your questions are of the simplest possible kind; even so simple and

so easily answered, that it seems almost stupid to ask or answer them. "Of course," he says to one; "Certainly," to another; "No doubt about that," to a third, and so on. Presently you slip one in that is neither "of course" nor "certainly," and get your answer.

He may be an old man (generally is), and the subject of inquiry a right of way. He may be "the oldest inhabitant." What are the moving springs of human conduct? Love of justice, which he has known from a boy upwards, and his father before him, as "*right is right, and wrong is no man's right.*" Self-approbation, or vanity, concentrated in him under the form of "*a wonderful memory,*" which has been the talk of the neighbors for years; the knowing more of by-gone times than any man or woman in the place; *Selfishness*, called by him his "*uprightness and downstraightenedness*"; Independence of spirit, "*he cares for no man, and always paid twenty shillings in the pound*" — these are the vulnerable points in his armor; and if you cannot thrust an arrow in at any of these, you had better hang up your bow, for you will never make a good archer. He will answer anything if you appeal to his memory, or if your question magnifies his independence of spirit, or brings out in all its dazzling luster that "*uprightness and downstraightenedness,*" of which exalted virtue he believes himself to have been ever a most distinguished example, if not the actual discoverer.

And thus the Dogged witness may be tamed and rendered docile, even as that more sagacious creature, the elephant, may be taught to stand on its head.

The Hesitating Witness. A hesitating witness may be a very cautious and truthful witness, or a very great liar. You will find this out before you begin to cross-examine. In most cases the hesitating man is wondering what effect the answer will have upon the case, and not what the proper answer is. By no means hurry this individual. Let him consider well the weight of his intended answer, and the scale into which it should go, and in all probability he will put it into the wrong one after all. If he should, *leave it there by all means.* I advise this, because I have so often seen young advocates carefully take it out again and put it into the other. Besides, your giving him plenty of time will tend to confuse him — as confused he should be if he is not honest. He can't go on weighing and balancing answers without becoming bewildered as to their probable results. . . . Very often he will repeat the question to gain time. Sometimes he pretends not to hear, sometimes not to know; all this time he is adjusting his weights, and in all probability some of them are false. . . .

Hesitation, however, may result from a desire to be scrupulously accurate, in which case you must be careful that the mere strictness of language do not convey a false impression. The letter sometimes, even in advocacy, kills, where the spirit would make alive.

The Nervous Witness. A nervous witness is one of the most difficult to deal with. The answers either do not come at all, or they tumble out two or three at a time; and then they often come with opposites in close companionship; a "Yes" and a "No" together, while "I don't know" comes close behind. "I believe so," or "I don't think so," is a frequent answer with this witness, as it is with the lying and the truthful witness. They are all partial to this expression, but all from different and opposite motives.

You must deal gently with this curious specimen of human nature. He is to be encouraged. It is no use to bray him in a mortar. . . . You

should deal as gently with a weakness of this kind as you would with a shying horse; encourage and humor him, while you familiarize him with the dreaded object, which is your learned self. The nervous witness, like all others, is either to be cross-examined or not; if he be, you must do it without driving him into such a state that his answer, however favorable, will have no value in the eyes of the jury; and this will surely be the effect of agitating him by petulant impatience. Endeavor to quiet his nerves if you think you can obtain anything serviceable to your case; if not, leave him alone altogether. Great allowance is always made for a nervous witness, who invariably receives the sympathy of the jury. You have to guard, therefore, against offending that sympathy, as you undoubtedly would by a severe tone or manner.

The Humorous Witness. The humorous witness is mostly found in theatrical cases, where he is generally looked for; and in the majority of them he seems to be conscious that he is expected. He scarcely ever says a good thing, although everybody laughs whenever he tries to. He is generally encouraged all round, and very often the judge will say a good thing for him. This witness is a public character, and at any risk he must not disappoint his eager patrons. If he says a good thing, it will be in to-morrow's paper, and the theatrical world will have it for breakfast. If he cannot manage it, his performance will be a failure. So he mounts the box and looks all round the court as much as to say, "The last witness was nothing, now comes the real performance."

No one need be told that his weak point, like that of almost all men, is vanity, and his strong one good temper. You will scarcely ever find him intentionally false, and he seldom attempts to mislead. He rarely has any interest in the case, and most frequently not the excitement incident to party feeling. As a rule he is the friend of both sides, as he is with the human family generally; for though he may be out at elbows with all the world, he brings "railing accusation" against no one.

Supposing the action to be one of assault, you can successfully appeal to his good nature if you are for the defendant; and he will almost rub the cause of action out for you as he would a debtor account from a slate. Play him with his superabundant good humor, and lay aside the style of the cross-examiner altogether. Be with him like a schoolmaster with the boys after school, and you will find that he will jump to your conclusions if you offer him a back. . . .

The Cunning Witness. The cunning witness must be dealt with cunningly. Humor would be mere pastime, and straightforward questioning out of character with him. But by way of contrast, and for that only, straightforwardness may not be out of place with the jury. Whatever of honesty, whether of *appearance*, manner, tone, or language contrasts with the vulgar, self-asserting and mendacious acting of this witness will tend to destroy him. It will be the antidote to his craftiness. It is strange, but true, that no man can be what is usually understood as a "cunning person" and conceal the fact. He is not really a shrewd man, but only thinks he is, tries to be, and, above all, wishes to be thought so. He always pretends that he has some deep and hidden meaning in what he says and does, which no amount of skill or perception on your part can penetrate. He would be an impostor to the world if he could, but the only person he really imposes upon is him-

self. Every one can see that he tries to appear what he is not, and that he pretends to know a great deal more than he does. This is the man to show to the jury in his real character, and they will enjoy your good-humored exposure of the cheat. . . .

The Canting Hypocrite. The canting hypocrite is not the least pleasing object of creation when in the witness box, nor is he the most difficult to cross-examine. He invariably speaks from the very best and purest of motives. His desire is only to speak the truth; no, not merely that, but without so much as an *apparent* tinge of partiality. He has no interest in the case — no feeling. It is such a pity it could not have been settled out of court as he proposed, himself to be the arbitrator.

Here is a good man for you! It is a pity that necessity and a sense of duty should compel you to cross-examine such a man at all. It seems almost an insult, but excusable on this ground — that his extreme disinterestedness and impartiality might impose upon the jury and do your client an injustice if you did not. Now you will observe about this rogue that whenever he approaches a downright lie he shirks it. It is a part of his very character to believe he is an honest man. When he comes to a lie, therefore, that he dares not face, he is like a bad hunter who will not leap the fence, but looks round to see if there be a gap somewhere hard by or a somewhat *lower* fence that he may scramble over, and so not do violence to himself in the event of a mishap. The hypocrite coming up to the lie, says: "I am not quite clear; I should hardly like to go so far as that." But he will wriggle over on to the other side somehow if you show him a place. So, if you put it to him something in this form: "I presume I may take it, Mr. Pecksniff, that so-and-so is the case?" "Well," says he, "I think you may." Now he's fairly over. You will not fail to mark this characteristic in him, that whenever he begins to *think*, to be *not quite sure*, *not clear*, and *to believe* and *presume*, and so forth, he is incubating a downright lie. He himself is a lie that needs little telling. His evidence, which may and will be always on the confines of truth, must be closely examined to see on which side of the boundary it really is. . . . He is too excellent to deny the truth if you put it to him *in infinitesimally small quantities at a time in the shape of simple leading questions*, each one carrying with it the shadow of perjury, which this man will always avoid committing at any cost.

The rogue believes in two things — Religion and his own Goodness. His religion is covetousness, which he always construes into a Special Providence; and his Goodness is exemplified in an enthusiastic worship of *Himself*. He is an eminently moral man, as every one will tell you; but his morality springs not from a genuine piety, but from arrant cowardice. He would sin to his heart's content but for the dread of punishment. He is a weak sinner nevertheless, who cannot even plead a robust constitution in mitigation.

The Witness partly True and partly False. The witness who is partly true and partly false, without hypocrisy, knowing that he is giving color to some facts, suppressing others, and adding little ones to make good measure for his party, is the most difficult of all to deal with. The process of separating the true from the false requires skill as well as ingenuity and patience. You must have a delicacy of touch in manipulating evidence of this kind that comes only by actual practice. Experienced advocates are frequently deceived, and judges even fail at times to separate what is true from what is

false. . . . And you must bear in mind that it is not sufficient for you yourself to know the nature and character of the evidence ; your task will only be half accomplished at this point. There will still remain the more difficult one of exhibiting it to the jury in the same light, and with the same aspect with which it presents itself to your own mind. . . . If, however, you can lay hold of any one part and expose an incongruity or an incompatibility, you will have accomplished a great deal. Expose an attempt at deception anywhere in a witness's evidence, and you have nearly, if not quite, destroyed it all. You must watch carefully to find out if there be a want of assimilation in the parts of the story ; if there be a disagreement between some of the false parts and some of the true, you must ascertain whether the alleged facts can exist together and in connection with one another, and must cross-examine for causes and effects ; you will then determine whether they agree with the facts stated by other witnesses. Men do not gather "figs off thistles," and if you find the same cause producing opposite effects, there is falsehood somewhere.

Improbabilities always have great weight with a jury : and if you cross-examine for these in a witness who tells a story partly true and partly false, you may succeed in detecting some. . . . The story told by this witness would resemble a neatly papered wall. On a general glance, such as an ordinary spectator would give, it would appear perfect ; but a critical examiner would discover that the pattern was broken here and there to meet the requirements or shape of the wall, notwithstanding that considerable skill had been employed to make the broken portions fit in so as to deceive the eye. As a whole, it looks complete ; examined in detail, the patchwork is apparent ; the *pattern* is not preserved in an integral condition. . . .

The Positive Witness. There is another class of witness which may be mentioned, and that is the positive witness (generally a female or of female tendencies). It is usually very difficult to make the witness unsay anything she has said, however mistaken she may be ; but you may sometimes lead her by small degrees to modify her statements, or induce her to say a great deal more in her positive way ; and the great deal more may be capable of contradiction, or may itself contradict what has been said before by the same witness. If you deal with her skillfully, she will in all probability be equally positive about two or three matters which cannot exist together. She is the worst witness to unsay anything, but the best to lead into a contradiction of what she has said.

Her idea of an oath is not that it should be a restraint upon her mendacity, but that it should give force to her positive assertions — a stamp of genuineness like the Queen's head on a bad shilling. She would unhesitatingly have sworn that Abel struck the first blow if she had been called on the side of Cain. She always stands up for what she calls "her own side." Beware how you try to convince her that she must be wrong. Such questions as "How can that be ?" will only draw the answer, "I don't know how it *can* be, but I know it *is*." You might just as well try to convince a street mongrel that barking is done away with, as to attempt to persuade her that she ought not to be quite so positive.

The Awkward Witness—Mr. Growles. "Better let me take this witness," says the leader ; "he's rather awkward." The learned counsel knows him, I should think. Examined him before, perhaps, and lost his case. An

"awkward" witness to examine, chiefly because his instinct is to contradict "everybody and everything." His neighbors would tell you that he is "the contrariest man that ever was bornd." Unless by sheer force of circumstances he would never agree with anybody upon any subject whatever. If you were to say, "A fine morning, Mr. Growles," he would answer in a tone by no means conciliatory, "*It'll rain afore long.*" Suggest in the most friendly manner that it is rather warm, he'll sneeringly reply that "*it's a great coo-at colder 'an it was yesterday.*" So you cannot tell where to have him. No wonder the leader takes him in hand; he requires masterful treatment. The "instructions" seem to refer to a watercourse, respecting which I suppose there is a dispute between riparian owners; or it may be some Genii, who live at the bottom, and the parish authorities. Perhaps we shall find out from the examination of the witness.

He clambers into the box with a clatter of hobnails and appears at the top with a very big, red, flat face, and a small sharp nose. He stares all round the court as though he were looking after somebody with whom he meant to have a row, and then stares at the judge as if he were a good-sized ghost in his best clothes. Presently he hears a soft sad voice appealing to him in these terms:

"I think you have known this watercourse for a good many years, haven't you, Mr. Growles?" It is the voice of the leader. There is a pathos in the tone which is irresistibly persuasive, and there is a smile upon the leader's face which is almost *angelic* — not quite. At this soft wooing, Mr. Growles looks up, and in a voice which sounds the more loudly and gruffly by contrast, exclaims, striking the ledge of the witness box with his fist —

"*No, I ain't!*"

Then he turns half round towards the jury, as much as to say, "I had un there!" This supposed observation is concluded with another supposed remark to the learned leader in this form:

"You mornt try none o' them ere geames on wi' me, I can tell ee!"

"I thought you had," says the leader, meekly, his face beaming with blushes.

Leader then turns over a sheet of his brief, and whispers behind his hand to the solicitor who is instructing him —

"This *is* Growles, isn't it?"

Solicitor in great excitement jumps up, twists round, and exclaims, with fearful rapidity —

"Yes, yes; this the one; very careful? told you awkward, awfully queer; gently as ever you can; careful, only witness —"

"Hush! don't be so excited, Mr. Miles," says the counsel.

Then the leader, satisfied himself that it is Mr. Growles, has to satisfy Mr. Growles of that fact; so he says to him:

"You *are* Mr. Growles?"

"*Be I?*" says Growles, not quite convinced.

"*Well, ARE you?*" asks the leader, this time somewhat facetiously, for the court is roaring with laughter, although there is nothing to laugh at; but the judge began it.

"*Suppose I be — what then?*"

"Come, get on," says the learned judge; "we are a long way off from the issue yet."

"Well, now, come, Mr. Growles; I dare say we shall understand one another presently." This is said in the most insinuating manner you can imagine — a manner that the learned counsel was accustomed to years and years ago in other and sweeter scenes.

"*I be ready,*" says the witness, clutching the ledge of the witness box as though the next shot might dislodge him.

"You've known this watercourse for some time, haven't you?"

"*Not all on her, I ain't.*"

"*All on her?*" repeats the leader.

The learned judge explains. "You see, Mr. Smiles, the witness is a particularly accurate witness, and when you ask him if he knows the watercourse he naturally thinks you mean *all* the watercourse, and so he says, 'No, I don't; I know a part of it.'"

At this Growles nods and grins triumphantly.

"Well, now, then, Mr. Growles, such part as you have known you have known for a *great* number of years, haven't you?"

"*No, I ain't,*" says Growles; "I've knowed her on and off for a matter o' two-and-twenty 'ear come Candlemas, ever since I worn't no 'igher 'an that."

"Well, well," says the leader, with renewed hope, "that's something. We shall get on now."

"*I doan't know so much about that,*" replies the witness. "*I be here t' spak the truth.*"

"Very well, Mr. Growles, have you ever known it take any other course than the one it now flows in?"

"*Yes, I have.*" This is uttered very loudly, and with another nod. Counsel on the other side of course laugh and shake their heads as much as to say, "You see the case *we've* got."

("I told you he was awkward," whispers the solicitor.)

"Pray, pray, sir, don't interrupt," remonstrates the leader. "This is really too bad." Then, stooping down, "Why did you bring such a witness as this? he's selling us. Where have you known it take a different course?" he asks the witness.

"*Where?*" repeats Growles.

"Yes, where, sir? Don't fence with me, sir, but answer. You are here to speak the truth, and the truth I'll have." Leader seems to be warming up a bit.

"*I'll spoken out,*" says Growles.

"He's your own witness," murmurs the opposite leader.

"Where have you known the water flow in a different course, sir?"

"I've knowed her goo down athirt an' across Squire Stookey's field, till t' squire turned her off down by t' lane close up gin Fairmile Corner, and sent her through Hog's Moor and away down —"

"Oh, dear, dear," says Smiles; "that's miles and miles away, my good fellow."

"I can't help un, sir; it's true, and I'll spak t' truth: I bean't asheamed."

"But, pray attend, sir. Close by the plaintiff's garden did not this watercourse always run in the same place?"

Objected to as a leading question — a slip by the learned counsel, who was just the merest trifle irritated at the crookedness of the witness.

"Where *did* it run, man? I'll have an answer if I stand here all day."

You have come to tell the court, and you must do so, and not trifle with us in this way. Did it run as it does now or in some other direction?"

"Allays, as fur's ever I know'd, she did."

"Stand down, sir," says the leader. . . .

And there's the end of his evidence — no more loads to push up hill that day. Well may the leader observe to his solicitor, "What on earth did you call that witness for? — he has lost the case."

Topic 4. Confessions of Guilt

277. HANS GROSS. *Criminal Psychology*. (transl. Kallen. 1911. § 8, p. 31.) The confession is a very extraordinary psychological problem. In many cases the reasons for confession are very obvious. The criminal sees that the evidence is so complete that he is soon to be convicted and seeks a mitigation of the sentence by confession, or he hopes through a more honest narration of the crime to throw a great degree of the guilt on another. In addition there is a thread of vanity in confession — as among young peasants who confess to a greater share in a burglary than they actually had (easily discoverable by the magniloquent manner of describing their actual crime). Then there are confessions made for the sake of care and winter lodgings: the confession arising from "firm conviction" (as among political criminals and others). There are even confessions arising from nobility, from the wish to save an intimate, and confessions intended to deceive, and such as occur especially in conspiracy and are made to gain time (either for the flight of the real criminal or for the destruction of compromising objects). Generally, in the latter case, guilt is admitted only until the plan for which it was made has succeeded; then the judge is surprised with a well-founded, regular, and successful establishment of an alibi. Not infrequently confession of small crimes is made to establish an alibi for a greater one. And finally there are the confessions Catholics are required to make in confessional, and the death-bed confessions. The first are distinguished by the fact that they are made freely and that the confessee does not try to mitigate his crime, but is aiming to make amends, even when he finds it hard; and desires even a definite penance. Death-bed confessions may indeed have religious grounds, or the desire to prevent the punishment or the further punishment of an innocent person.

Although this list of explicable confession types is long, it is in no way exhaustive. It is only a small portion of all the confessions that we receive; of these the greater part remain more or less unexplained. . . . A number of cases may perhaps be explained through pressure of conscience, especially where there are involved hysterical or nervous persons who are plagued with vengeful images in which the ghost of their victim would appear, or in whose ear the unendurable clang of the stolen money never ceases, etc. If the confessor only intends to free himself from these disturbing images and the consequent punishment by means of confession, we are not dealing with what is properly called conscience, but more or less with disease, with an abnormally excited imagination. But where such hallucinations are lacking, and religious influences are absent, and the confession is made freely in reponse to mere pressure, we have a case of conscience, — another of

those terms which need explanation. I know of no analogy in the inner nature of man, in which anybody with open eyes does himself exclusive harm without any contingent use being apparent, as is the case in this class of confession. There is always considerable difficulty in explaining these cases. One way of explaining them is to say that their source is mere stupidity and impulsiveness, or simply to deny their occurrence. But the theory of stupidity does not appeal to the practitioner; for even if we agree that a man foolishly makes a confession and later, when he perceives his mistake, bitterly regrets telling it, we still find many confessions that are not regretted and the makers of which can in nowise be accused of defective intelligence. To deny that there are such is comfortable but wrong, because we each know collections of cases in which no effort could bring to light a motive for the confession. The confession was made because the confessor wanted to make it, and that's the whole story.

The making of a confession, according to laymen, ends the matter; but really, the judge's work begins with it. As a matter of caution all statutes approve confessions as evidence only when they agree completely with the other evidence. Confession is a means of proof, and not proof. Some objective, evidentially concurrent support and confirmation of the confession is required. But the same legal requirement necessitates that the value of the concurrent evidence shall depend on its having been arrived at and established independently. The existence of a confession contains powerful suggestive influences for judge, witness, expert, for all concerned in the case. If a confession is made, all that is perceived in the case may be seen in the light of it, and experience teaches well enough how that alters the situation. . . . It fits. So does the autopsy, so do the depositions of the witnesses. Everything fits. There have indeed been difficulties, but they have been set aside, they are attributed to inaccurate observation and the like, — the point is, — that the evidence is against A. Now, suppose that soon after B confesses the crime; this event is so significant that it sets aside at once all the earlier reasons for suspecting A, and the theory of the crime involves B. Naturally the whole material must now be applied to B, and in spite of the fact that it at first fitted A, it does now fit B. Here again difficulties arise, but they are to be aside set just as before. Now if this is possible with evidence, written and thereby unalterable, how much more easily can it be done with testimony about to be taken, which may readily be colored by the already presented confession. The educational conditions involve now the judge and his assistants on the one hand, and the witnesses on the other.

Concerning himself, the judge must continually remember that his business is not to fit all testimony to the already furnished confession, allowing the evidence to serve as mere decoration to the latter, but that it is his business to establish his proof by means of the confession, and by means of the other evidence, *independently*. The legislators of contemporary civilization have started with the proper assumption that also false confessions are made, — and who of us has not heard such? Confessions, for whatever reason, — because the confessor wants to die, because he is diseased, because he wants to free the real criminal, — can be discovered as false only by showing their contradiction with the other evidence. If, however, the judge only fits the evidence, he abandons this means of getting the truth.

. . . I repeat: the suggestive power of a confession is great and it is hence really not easy to exclude its influence and to consider the balance of the evidence on its merits, — but this must be done if one is not to deceive one's self. Dealing with the witness is still more ticklish, inasmuch as to the difficulties with them, is added the difficulties with one's self. . . . In this regard it cannot be sufficiently demonstrated that the coloring of a true bill comes much less from the witness than from the judge. The most excited witness can be brought by the judge to a sober and useful point of view, and conversely, the most calm witness may utter the most misleading testimony if the judge abandons in any way the safe bottom of the indubitably established fact.

It happens comparatively seldom that untrue confessions are discovered; but once this does occur, and the trouble is taken to subject the given evidence to a critical comparison, the manner of adaptation of the evidence to the confession may easily be discovered. The witnesses were altogether unwilling to tell any falsehood and the judge was equally eager to establish the truth, nevertheless the issue must have received considerable perversion in order to fix the guilt on the confessor. Such examinations are so instructive that the opportunity to make them should never be missed. . . .

278. DANIEL WEBSTER, *Argument for the Prosecution in COMMONWEALTH v. KNAPP*. (*Great Speeches and Orations of Daniel Webster*. ed. Whipple, 1899, p. 192.) [Mr. White, a highly respectable and wealthy citizen of Salem, about eighty years of age, was found, on the morning of the 7th of April, 1830, in his bed, murdered, under such circumstances as to create a strong sensation in that town and throughout the community. Richard Crowninshield, George Crowninshield, Joseph J. Knapp, and John F. Knapp were, a few weeks after, arrested on a charge of having perpetrated the murder, and committed for trial. Joseph J. Knapp, soon after, under the promise of favor from the government, made a full confession of the crime and the circumstances attending it. In a few days after this disclosure was made, Richard Crowninshield, who was supposed to have been the principal assassin, committed suicide. A special session of the Supreme Court was ordered by the legislature, for the trial of the prisoners, at Salem, as printed *post* No. 392. . . . At the request of the prosecuting officers of the government, Mr. Webster appeared as counsel, and assisted in the trial.] . . .

Gentlemen, — it is a most extraordinary case. In some respects, it has hardly a precedent anywhere; certainly none in our New England history. This bloody drama exhibited no suddenly excited, ungovernable rage. . . . It was a cool, calculating, money-making murder. . . . An aged man, without an enemy in the world, in his own house, and in his own bed, is made the victim of a butcherly murder, for mere pay. . . . The deed was executed with a degree of self-possession and steadiness equal to the wickedness with which it was planned.

The circumstances now clearly in evidence spread out the whole scene before us. Deep sleep had fallen on the destined victim, and on all beneath the roof. A healthful old man, to whom sleep was sweet, the first sound slumbers of the night held him in their soft but strong embrace. The as-

sassin enters, through the window already prepared, into an unoccupied apartment. With noiseless foot he paces the lonely hall, half lighted by the moon; he winds up the ascent of the stairs, and reaches the door of the chamber. Of this, he moves the lock, by soft and continued pressure, till it turns on its hinges without noise; and he enters, and beholds his victim before him. The room is uncommonly open to the admission of light. The face of the innocent sleeper is turned from the murderer, and the beams of the moon, resting on the gray locks of his aged temple, show him where to strike. The fatal blow is given! and the victim passes, without a struggle or a motion, from the repose of sleep to the repose of death! It is the assassin's purpose to make sure work; and he plies the dagger, though it is obvious that life has been destroyed by the blow of the bludgeon. He even raises the aged arm, that he may not fail in his aim at the heart, and replaces it again over the wounds of the poniard! To finish the picture, he explores the wrist for the pulse! He feels for it, and ascertains that it beats no longer! It is accomplished. The deed is done!

He retreats, retraces his steps to the window, passes out through it as he came in, and escapes. He has done the murder. No eye has seen him, no ear has heard him. The secret is his own, and it is safe!

Ah! gentlemen, that was a dreadful mistake. Such a secret can be safe *nowhere*. The whole creation of God has neither nook nor corner where the guilty can bestow it, and say "It is safe." Not to speak of that eye which pierces through all disguises, and beholds everything as in the splendor of noon, such secrets of guilt are never safe from detection, even by men. True it is, generally speaking, that "murder will out." True it is, that Providence hath so ordained, and doth so govern things, that those who break the great law of Heaven by shedding man's blood seldom succeed in avoiding discovery. Especially, in a case exciting so much attention as this, discovery must come, and will come, sooner or later. A thousand eyes turn at once to explore every man, every thing, every circumstance, connected with the time and place; a thousand ears catch every whisper; a thousand excited minds intensely dwell on the scene, shedding all their light, and ready to kindle the slightest circumstance into a blaze of discovery.

Meantime the guilty soul cannot keep its secret. It is false to itself; or rather it feels an irresistible impulse of conscience to be true to itself. It labors under its guilty possession, and knows not what to do with it. The human heart was not made for the residence of such an inhabitant. It finds itself preyed on by a torment, which it dares not acknowledge to God or man. A vulture is devouring it, and it can ask no sympathy or assistance, either from heaven or earth. The secret which the murderer possesses soon comes to possess him; and, like the evil spirits of which we read, it overcomes him, and leads him whithersoever it will. He feels it beating at his heart, rising to his throat, and DEMANDING disclosure. He thinks the whole world sees it in his face, reads it in his eyes, and almost hears its workings in the very silence of his thoughts. It has become his master. It betrays his discretion, it breaks down his courage, it conquers his prudence. When suspicions from without begin to embarrass him, and the net of circumstances to entangle him, the fatal secret struggles with still greater violence to burst forth. It *must* be confessed. It *will* be confessed. There is no refuge from confession, but suicide, — and suicide is confession.

279. HONORÉ DE BALZAC. *Lucien de Rubempré*. (c. XV); and *The Last Incarnation of Vautrin*. (c. II, Miss Wormeley's translation.)

[Lucien de Rubempré was a sentimental, fashionable youth, of weak will, who had fallen completely under the control of the Abbé Carlos Herrera, a pretended Spanish priest and spy. Herrera was really a desperate and hardened criminal, by name Jacques Collin, nicknamed Trompe-la-Mort. He plotted a vast scheme to secure a rich marriage for Lucien, obtain for him high official position, and thereby amass wealth. Lucien knew fully Collin's nefarious character, and entered into the plot. He accordingly courted Mlle. Clotilde de Grandlieu, a noble heiress. Meantime he prepared to give up his mistress, Esther Gobseck, a beautiful Jewess, who truly loved him. Esther had been given by an aged admirer, Baron de Nucingen, the sum of 750,000 francs, which she kept in her room. In despair at her impending loss of Lucien, Esther took poison, and was found dead in her bed by the servants; who immediately absconded with the 750,000 francs. But just before this, unknown to Esther, her grand-uncle, the usurer Gobseck, had died, leaving her sole heiress to his 7,000,000 francs. The Baron had hurried to Esther's house, to inform her of the inheritance from her uncle, but found her dead, and his own gift gone. The police and the coroner came to investigate the cause of Esther's death. Under her pillow they found her will, leaving all her property to Lucien. (The will had in fact been forged by Jacques Collin, after her death, but this forgery was not detected.) Her sudden death, her will bequeathing all to Lucien, and the disappearance of the Baron's gift, gave rise immediately to the suspicion that Lucien and Collin had murdered her. Warrants were issued for their arrest. Collin is arrested. Lucien is pursued by the police, and is

found with Mlle. de Grandlieu, just as they are exchanging pledges of marriage.] . . .

The gallop of several horses was heard, and in a moment a squad of gendarmes surrounded the little group, much to the astonishment of the two ladies.

"What do you mean by this?" said Lucien, with the arrogance of a fashionable young man.

"Are you Monsieur Lucien de Rubempré?" asked a person who was the public prosecutor of Fontainebleau.

"Yes, monsieur."

"You will sleep to-night in La Force; I have a warrant to arrest you." . . .

"Of what crime is monsieur accused?" asked Clotilde, whom the duchess was entreating to get into the carriage.

"Of theft, and murder," replied the corporal of gendarmes.

Baptiste lifted Mademoiselle de Grandlieu in a dead faint into the carriage. At midnight Lucien was locked up in the prison of La Force, where he was kept in solitary confinement. The Abbé Carlos Herrera had been brought there on the previous evening. . . .

Before entering into the terrible drama of a criminal examination, it is necessary to explain the normal process of a case of this kind, so that its divers phases may be better understood. . . . A crime is committed. If detected in the act, the suspected persons are taken to the nearest guardhouse and put in the cell called in popular parlance "the violin," probably on account of the music — of cries and tears — that is heard there. From there they are taken before the commissary of police, who makes a preliminary inquiry and has the power to release them if a mistake has been made; otherwise they are next taken to the depot, or guardhouse

of the prefecture, where the police hold them at the disposition of the prosecuting officer and the examining judge, who, being informed of the affair, more or less promptly according to the gravity of the case, come to the depot and question the parties, who are in a condition of provisional arrest. According to the presumptive nature of the case the examining judge issues a warrant and orders the accused person locked up in a house of correction. . . . When the examination ends and the judge decides that the accused persons must be referred to a court of justice, they pass to the condition of indicted persons. . . . Few of them ever dream of resisting the situation in which the law and the police of Paris place accused persons, — especially those who, like Jacques Collin and Lucien, are in solitary confinement.

It is difficult for those at large to imagine what this sudden isolation is to the accused person; the gendarmes who arrest him, those who convey him to the lockup, the turnkeys who place him in what is literally a dungeon, those who take him by the arm and make him mount the step into the police van, in short, all the beings who surround him from the time of his arrest, are mute, and notice him only to make a record of his words for the police or the judge. This absolute separation, so instantaneously and easily brought about between the whole world and the accused person, causes an upset of all his faculties, and a fearful prostration of mind; above all, when the person happens to be one not familiar, through his antecedents, with the ways of the law. The duel between the accused man and the examining judge is, therefore, all the more terrible because the latter has for auxiliary the silence of the walls, and the incorruptible stolidity of the agents of the law. . . .

Lucien's appearance was that of a broken-down culprit; he aban-

doned himself wholly and allowed them to do what they pleased with him. From the moment of his arrest at Fontainebleau, the poet considered himself ruined; he felt that the moment of expiation had come. Pale, undone, ignorant of all that had happened as to Esther, he knew only that he was the intimate companion of an escaped galley slave. That situation was enough to make him foresee catastrophes that were worse than death. If his thoughts turned to anything resembling a plan, it was to suicide. He wanted to escape at any price from the ignominy which he saw before him like a dreadful dream. . . . He was placed in a cell adjoining the Pistoles. Most persons who have never had anything to do with criminal justice have the blackest ideas about solitary confinement. They hardly separate them from the old ideas of torture, unhealthiness of dungeons, cold walls sweating tears of dampness, brutality of jailers, and coarseness of food, — accessories required for the drama. It may not be useless to say here that these exaggerations exist only on the stage, and make judges, lawyers, officials, and all who visit prisons either out of curiosity or on errands, laugh. . . . And it may be said that, putting aside the fearful mental and moral tortures of persons of the upper classes who find themselves in the grasp of the law, the action of this new power is of a gentleness and simplicity which seem all the greater because unexpected. Accused persons are certainly not lodged as they would be in their own homes, but all necessities are found in the prisons of Paris. It is not the body that suffers; in fact, the mind is in so agitated a state that any form of being ill at ease, even brutality if it were met with, can be easily supported. And it must be allowed that the innocent are quickly set at liberty, especially in Paris. Lucien found, therefore, in his cell a repro-

duction of the first room he had occupied on his arrival in Paris. A bed like those in the poorest furnished lodgings of the Latin quarter, chairs with straw seats, a table and a few utensils, completed the furniture of a room in which were sometimes confined two indicted persons if their behavior were good and their crimes not dangerous, — such, for instance, as forging and swindling. This resemblance between his point of departure, bright with innocence, and his end at the lowest step of shame and degradation, was so instantly seized by a last flash of his poetic nature that he burst into tears. He wept for four hours, as insensible apparently to everything about him as a stone image, but suffering anguish from his broken hopes, his shattered social vanities, his annihilated pride; degraded in that *I*. and all that *I* represented of ambition, adoration, luck, of the poet, the Parisian, the dandy, the man of pleasure, and of social privilege and success! All was crushed within him by this Icarian fall. . . .

To be in the secret of the terrible scenes which are enacted in the office of an examining judge; to fully understand the respective situations of the two antagonists, — the accused person and the magistrate, — the object of whose struggle is the secret guarded by the accused against the curiosity of the judge (who is called, in prisoner's slang, the Curious), we must never forget that the accused persons, who have been in solitary confinement from the moment of their arrest, are ignorant of all that the public says, all that the police and the judges know, all that the newspapers publish, as to the crime of which they are accused. . . . These points once explained, the least emotional person will tremble at the effect produced by three causes of terror, — isolation, silence, and remorse. . . .

A few minutes after two o'clock

Monsieur Camusot saw Lucien de Rubempré brought to his office — pale, limp, undone, his eyes red and swollen, in a state of prostration, which enabled him to compare nature with art, — the really fainting man with the fainting actor. The passage from the Conciergerie to the judge's room, made between two gendarmes preceded by an usher, had brought despair to its acme in Lucien. It is in the nature of a poet to prefer death to punishment. Beholding this nature utterly devoid of mental courage, — a courage so powerfully manifested in the other prisoner, — Monsieur Camusot felt scorn for his easy victory. "Monsieur," said the judge, in a very kindly manner, "it is, nevertheless, difficult to set you at liberty without fulfilling certain formalities, and putting a few questions to you. It is almost as a witness that I shall now require you to answer. To a man like you, I think it useless to remark that the oath to tell the truth is not only an appeal to your conscience, but it is also a necessity of your position, which has been for a short time ambiguous. The truth, no matter what it is, cannot injure you; but falsehood would send you to the court of assizes, and will oblige me now to send you back to the Conciergerie, whereas, if you answer frankly, you will sleep at home to-night, and you shall be publicly vindicated in the public journals by the following notice: 'Monsieur de Rubempré, arrested yesterday at Fontainebleau, was immediately released after a very short examination.' . . . I repeat, you have been suspected of complicity in the murder, by poison, of the Demoiselle Esther. There is, however, proof of her suicide, and that ends the question of murder. But a sum of money has been taken from the house, — 750,000 francs, — which now forms part of your inheritance. Here, unfortunately, there is a crime. The crime precedes the discovery of

the will. Now the law has reason to think that a person who loves you, as much as the Demoiselle Esther loved you, has been guilty of this crime for your sake. . . . Abandon the false, the miserable point of honor which binds accomplices together, and tell the whole truth."

Our readers must have already observed the extreme disproportion of weapons existing between accused persons and examining judges. It is true that denial, cleverly managed, has on its side completeness of form, and it is sufficient for a criminal's defense; but for all that, it is a sort of panoply which becomes a crushing weight when some turn in the examination discloses a rent in it. As soon as denial is insufficient against evident facts, the accused person is absolutely at the mercy of the judge. . . . "Now," said Camusot, after a pause, "what is your name? Monsieur Coquart, attention!" he said to the clerk. "Lucien Chardon de Rubempré."

"Where born?" "Angoulême." And Lucien gave the day, month, and year.

"You had no property from your father?" "None."

"You did, nevertheless, during your first residence in Paris, live at considerable expense, compared with your small means?" "Yes, monsieur; but I had at that time a devoted friend, in Mademoiselle Coralie, whom I had the misfortune to lose. It was grief, caused by her death, which took me back to my former home."

"Good, monsieur," said Camusot; "I commend your frankness; it will be appreciated."

Lucien was entering, as we see, upon the path of general confession.

. . . "Lately, in the hope of marrying Mademoiselle de Grandlieu, you bought the remains of the château de Rubempré, to which you have added lands worth about a million. You told the Grandlieu family that your sister and brother-

in-law had lately inherited a large fortune and that you owed the sum for the payment of your purchase to their liberality. Did you say that, monsieur, to the Grandlieu family?" "Yes, monsieur."

"You are ignorant of the reasons why your marriage was broken off?" "Entirely."

"Well, the Grandlieu family sent one of the most trusty lawyers in Paris to your brother-in-law, in order to obtain the information. This lawyer learned at Angoulême, from the statements of your sister and your brother-in-law, not only that they had lent you nothing, but that their inheritance was chiefly in land, and that the personal property amounted to little more than 200,000 francs. You cannot think it strange that a family like that of Grandlieu should draw back when they find your fortune such that you dare not explain its origin."

Lucien was struck dumb by this revelation; and the little strength of mind he still retained abandoned him.

"The police and the legal authorities know all they wish to know, remember that," said Camusot. "Now," he resumed, after a pause, thinking of the abbé's claim to be Lucien's father, "do you know who this so-called Carlos Herrera is?" "Yes, monsieur; but I knew it too late."

"Too late? how do you mean? Explain yourself." "He is not a priest, he is not a Spaniard, he is —"

"An escaped convict?" said the judge, quickly. "Yes," replied Lucien. "But when the fatal secret was revealed to me I was already under obligations to him. I thought I had allied myself with a respectable ecclesiastic —"

"Jacques Collin —" said the judge, beginning a sentence. "Jacques Collin," said Lucien, interrupting him, yes, that is his name."

"Good. Jacques Collin," resumed Camusot, "has just been rec-

ognized here by two persons; but he still denies his identity — in your interests, I think. . . .”

Instantly Lucien felt as if hot irons were plunged into him.

“Are you ignorant,” continued the judge, “that he pretends to be your father, to explain the extraordinary relation in which you stand to him?” “He! my father! Oh, monsieur, did he say that?”

“Have you suspected where the sums of money which he gave you came from? . . .” “Ah! monsieur, it is you who must tell me,” cried Lucien, “where convicts get their money — Jacques Collin my father! Oh! my poor mother!”

And he burst into tears.

“Clerk, read that part of the examination in which the pretended Carlos Herrera declares himself the father of Lucien de Rubempré.” The poet listened to the reading in silence and with a countenance it was painful to witness. “I am lost!” he cried.

“No man is lost in the path of truth and honor,” said the judge. “But you will send Jacques Collin to the assizes,” said Lucien.

“Undoubtedly,” replied Camusot, who wished to make Lucien say more. “Continue; say what you think.”

But in spite of the efforts and remonstrances of the judge, Lucien no longer answered. Reflection had come, — too late, as it does in all men who are slaves to feeling. . . . Lucien sat pale and dumb; he saw himself at the bottom of the precipice down which the judge had rolled him, while he, the poet, had let himself be trapped by apparent kindness. He had betrayed, not his benefactor, but his accomplice, — him, who had defended their position with the courage of a lion and an ability without a flaw. Just there, where Jacques Collin had saved Lucien by his audacity, Lucien, the man of mind, had lost all by his want of intelligence and his lack of reflection.

The infamous lie, which had so shocked him, was the screen of a truth, for him more infamous. Confounded by the subtlety of the judge, terrified by his cruel cleverness, by the rapidity of the blows given, by the exposure of the faults of all his life thus brought to light like so many grapnels to drag his conscience, Lucien was like an animal which the club of the slaughterhouse has missed. Free and innocent in the eyes of the law when he entered that room, in one hour he saw himself a criminal by his own confession. . . .

Monsieur Camusot enjoyed his triumph. He held two guilty men; with the hand of the law he had struck down an idol of fashionable society, and he had found the hitherto unfindable Jacques Collin. He would, undoubtedly, be considered one of the ablest of examining judges. So he let the unhappy prisoner keep silence; but he studied that silence of consternation; he saw the drops of sweat accumulating on that anguished face, swelling and rolling down to mingle with two streams of tears. . . . Lucien put Esther's letter and the miniature it inclosed upon his heart. Then he bowed haughtily to Monsieur Camusot, and walked with a firm step through the corridors between two gendarmes.

“That is an utter scoundrel!” said the judge to his clerk, as the door closed on Lucien. “He thought to save himself by sacrificing his accomplice.”

“Of the two,” replied Coquart, timidly, “the convict is the better man.” . . .

During the time the turnkey took in obtaining and bringing up to Lucien the things he had asked for, the unfortunate young man, to whom the idea of being confronted with Jacques Collin, was intolerable, fell into one of those meditations in which the idea of suicide, to which he had already yielded without accomplishment, attains to mania.

According to some great alienists, suicide in certain organizations is the termination of a mental alienation. Since his arrest Lucien had fastened on that idea. . . . Certainly it would have been difficult to act with more dignity in the false position to which infamy had brought Lucien. He saved his own memory, and he repaired the wrong done to his accomplice, so far as the mind of the man of the world could annul the effects of his actions. . . . By mounting on the table, Lucien could reach the glazed portion of the window, and, by removing or breaking two panes, he could use the strong crossbar between them as his point of support. He resolved to do this: to pass his cravat around the bar, making a turn about his own neck and fastening the end securely, and then to knock away the table from under him with his feet. He moved the table to the window noiselessly, took off his coat and waistcoat, and mounted the table without the least hesitation, to remove the panes above and below the first crossbar. [Then he hung himself.] . . .

Jacques Collin, nicknamed *Trompe-la-Mort*, in the world of the galleys and to whom we shall henceforth give no other name than his own, had been, from the moment of his reincarceration by Camusot's orders, in the grasp of an anxiety he had never before known in the course of a life marked by many crimes, by three escapes from the galleys, and two sentences in the court of assizes. . . . When returned to his solitary cell, Jacques Collin's thought was: "They are questioning the young one!"

He shuddered, — he who could strike as another man drinks. "Has he seen those women? Will they warn him? . . . Have they stopped the examination? Has Lucien received my letter? If fate wills that he be examined, how will he carry himself? Ah, poor boy! it is I who have brought him to

this!" . . . And so the monologue went on for three hours. The agony was so great that it got the better of that creature of iron and vitriol. Jacques Collin, whose brain was fired almost to madness, felt such devouring thirst that he drank, without observing that he did so, all the water contained in two buckets, which, with a wooden bedstead, form the whole furniture of a solitary cell. . . .

At this moment the director . . . left the cell to get it (the letter written by Lucien to Jacques Collin for transmission to the latter), leaving the doctor with the prisoner, in charge of the jailer.

"Monsieur," said Jacques Collin to the doctor, . . . "I shouldn't consider a matter of 30,000 francs, if I could be enabled to send five lines to Lucien de Rubempré." "I will not steal your money," replied the doctor. "No one on earth can communicate with that young man."

"No one?" said Jacques Collin, bewildered. "Why not?" "Because he hanged himself." . . .

Collin dropped back upon the camp bed, saying, "Oh! my son!"

"Poor man!" exclaimed the doctor, moved by this terrible struggle of nature. . . . Jacques Collin, exhausted by the violence of that explosion of grief, seemed to calm himself. . . .

"May I see him with my own eyes?" asked Jacques Collin, timidly. "Will you give a father freedom to mourn his son?" . . . The prisoner's eyes, devoid of warmth and life, moved slowly from the director to the doctor. . . .

"If you wish to see the body," said the doctor, "you have no time to lose. It is to be removed to-night." . . . Jacques Collin, accompanied by the jailer, who took him by the arm, preceded by the director and followed by the doctor, was only a few moments in reaching the cell where Lucien lay. They had placed him on a bed. At the sight, the convict fell upon the body,

clinging to it with a grip of despair, the strength and passionate movement of which made the three spectators shudder. . . . At one o'clock in the morning, when they came to remove the body, Jacques Collin was found kneeling beside Lucien's bed. . . . The miserable man was still holding the stiffened hand of him he had loved so well; he held it pressed between his own clasped hands, and was praying God. When they saw him thus, the jailers stopped for an instant; he resembled one of those stone figures kneeling for eternity on the tombs of the middle ages. . . . Looking once more at Lucien with the eyes of a mother from whom they are rending her son, Jacques Collin sank back upon himself. As he watched them take the body, so dreadful a moan escaped his breast that the porters hastened to be gone. The secretary of the attorney-general and the director of the prison had already withdrawn from the painful sight. What had become of that iron nature in which decision and resolution equalled the glance of those eyes in rapidity; in whom thought and action sprang forth with a single flash; whose nerves, inured by three escapes, three periods at the galleys, had attained to the metallic strength of the nerves of savages?

Iron yields to reiterated striking,

or to a certain continuance of pressure; its impenetrable molecules, purified by man and made homogeneous, segregate, and, without being in fusion, the metal has not the same power of resistance. Blacksmiths, locksmiths, tool makers, all men who work constantly in this metal, express that condition by a technical word. "The iron is retted," they say, appropriating a term which belongs properly to flax or hemp, the fiber of which is disintegrated by retting. Well, the human soul, or, if you choose to say so, the triple energy of body, heart, and mind, is found in a condition analogous to that of iron as the result of repeated shocks. It is then with men as it is with flax or iron: they are "retted." . . . It is in this state that confessors and examining judges often find great criminals. The terrible emotions caused by the court of assizes and by the "toilette" almost always bring even the strongest natures to what may be called a dislocation of the nervous system. Confessions escape the lips till then most firmly closed; the stoutest hearts give way, and this — strange fact! — at the moment when confession becomes useless, — when this sudden weakness merely tears from the guilty man the mask of innocence by which he disturbs the mind of justice.

280. ALLAN PINKERTON. *Bank Robbers and Detectives*. (1882. p. 231.)

[A bank was robbed of some \$65,000. A clerk of a store in the same building, one Sloane, was suspected. For nearly a year he was shadowed, but without result. Finally, he was found to be planning to sell some securities in a distant town. The detectives then arranged to arrest him and his chum in that place.]

. . . Wright reported that Sloane and Patterson intended taking the eight o'clock train in the morning and would return by way

of Troydon, as they had come; Patterson having found it impossible to induce Sloane to return by the way of Ryan. Mr. Warner immediately telegraphed me the state of affairs, asking what should be done. To this I replied that I would be at Elliott on arrival of the designated train from Portville, and would meet him there. I then telegraphed Mr. Somers to start immediately for Ryan and carry out the program already conveyed him by one of my detectives.

In the afternoon Sloane had sold to Messrs. Race & Co. two thousand dollars' worth of compound interest notes, many of them mildewed and worn like the one handed Patterson, and the entire number bearing evidence of having been for a long time secreted in some damp place or receptacle. At ten o'clock of the evening of the same day, I left Chicago for Elliott. The time had come when a little wholesome force could be used to advantage; and as some exceptional responsibility might attach to this, I proposed to conduct the affair in person.

As the express train from Portville rolled into the depot at Elliott, the next day at noon, Mr. Warner and myself stood on the platform, vigilant and ready for action. Mr. Warner, who had come on by the preceding train, had brought me the two thousand dollars in compound-interest notes, with the gratifying intelligence that, at last accounts, Sloane had expended none of the money paid him for the same, but carried all of it upon his person. Everything was therefore ripe for my purpose. . . . Patterson [the disguised detective] and Sloane appeared on the platform, and, with arms interlocked, proceeded to follow the retreating crowd. It was but the work of an instant to rush in between them, thrust Patterson violently aside, seize Sloane rudely by the wrist and say to him, in a voice of suppressed passion:

"I want you. Come this way!" In the same breath I shouted to Wright: "Officer! bring that man along; no parleying now!"

"What does this mean? this is an outrage!" began Patterson. We could hear no more, for Wright grasped his prisoner by the collar, taking in his grip shirt, collar, and all, and fairly drove him into the baggage car, while Patterson was seemingly rendered speechless from choking. As for Sloane, no such angry demonstrations were neces-

sary. He turned deathly pale the instant he recognized me, and began trembling violently from head to foot. So completely did his courage desert him that I had rather to support, than force, him into the same car with Patterson. . . .

"I know what this is for!" faltered Sloane, as he threw himself on a trunk and buried his face in his hands, a picture of abject despondency.

"What do you suppose it is for?" I inquired, ironically, drawing a pair of handcuffs from my pocket and preparing to fasten them upon his wrists. "Let's hear what it is for?" "The bank robbery," he gasped.

The twenty minutes' stoppage had expired, the bell rang, and we were on our way, not to Troydon, but to Ryan.

"Don't put those things on me, please!" stammered Sloane, in a supplicating way. "I give you my word I will make no effort to escape. I have no reason to do so," he added, gathering courage as he spoke, "for I am not guilty."

"Don't try to play that game on me, young man," I said sternly, and making the handcuffs secure. "I know all about whether you are guilty or not. If you begin by lying, I promise I will show you no mercy."

"Won't you trust me?" he pleaded. "I will tell you the whole truth whenever you wish to know it. I will go with you peaceably anywhere, but I cannot bear to be manacled in this way." . . . I then searched my prisoner thoroughly, emptying his pockets of their entire contents, and . . . the fruits of this search were a bunch of keys, some Masonic emblems, a watch and chain, two pocketbooks, and lastly, three thousand dollars in compound-interest notes, and twenty-three hundred and eighty dollars in greenback currency. "Ah!" I exclaimed, as this booty fell into my possession; "no doubt

you will be able to account for this trifling amount of pocket-money." Sloane shook his head in a dull, dejected way, and for a moment made no reply. He was completely unmanned, and I felt pretty certain that I should have but little further trouble with him. Presently, after a visible effort to regain his self-possession, he answered: "I hope to do so, sir. I came by it honestly." . . .

The county sheriff and a constable were at the depot on the arrival of our train at Ryan. I turned my prisoners over to their care, giving strict injunctions in Sloane's hearing that on no account were they to be allowed to communicate with one another. Sloane now had two or three hours for private meditation in his cell, during which time, Mr. Somers, Mr. Warner, Patterson, and myself discussed the good fare of the Mansion House, and the now pleasant condition of our operation. . . .

Late in the afternoon, in a private room which the jailer had placed at my service, Sloane was brought before me. I will not weary the reader with a full account of what transpired at this interview. It lasted over two hours, during the greater part of which time Sloane doggedly asserted his innocence of the robbery itself, and attempted to deceive me with the foolish invention that he had *found* a package of five thousand dollars of compound-interest notes on the Sunday morning following the burglary, in his store, near the Willow street door, where he presumed the robbers had dropped it in their flight. I made use of every argument and instrumentality I could think of to drive him from this story, and impel him to a full confession; but for a long time all was in vain. It was necessary to screen my detective at all hazards. I was, therefore, driven to the use of information, only, that I might have reached through other channels.

Still, with these resources alone, I was able to astound Sloane by reference to matters pointing to his guilt. He would show his affright and surprise by involuntary starts and exclamations, but he would not budge from his story. I gave him to understand that Mr. Marston had engaged me to track Barnes, and that I had abandoned the case after bringing it to the point of success, because Mr. Marston insisted upon compromising; a proceeding to which I was unalterably opposed. This explanation was offered incidentally, as a cover to Patterson, but chiefly to show that I had been for a long time on their joint trail, and to impress upon Sloane the conviction that full restitution was the only basis on which he could treat with me. It had been constantly reported to me that Sloane was a man of good domestic habits, devoted to his wife, and seemingly appreciative of home comforts. So, after all other attempts had proven futile, I strove to reach him through the medium of his affections. I pictured to him as best I might, and at great length, the distress that this affair would cause his friends and relatives, and most of all, his wife; and lastly, I spoke of the danger of his exposure in her then delicate condition, for, as I understood, he expected to be shortly a father. No sooner had I made this reference, than Sloane, who up to that time had maintained his old, impassable demeanor, burst into a flood of tears and cried out:

"Stop, stop! I beg of you;—I shall go mad. My poor wife! My dear, innocent, trusting wife! Oh, heavens! this will kill her!" Completely overcome, after giving vent to this wail, he buried his face in his handkerchief and rocked himself from side to side in an agony of remorse.

I confess that this spasmodic outburst quite astonished me. I was far from believing him to be a man

sassin enters, through the window already prepared, into an unoccupied apartment. With noiseless foot he paces the lonely hall, half lighted by the moon; he winds up the ascent of the stairs, and reaches the door of the chamber. Of this, he moves the lock, by soft and continued pressure, till it turns on its hinges without noise; and he enters, and beholds his victim before him. The room is uncommonly open to the admission of light. The face of the innocent sleeper is turned from the murderer, and the beams of the moon, resting on the gray locks of his aged temple, show him where to strike. The fatal blow is given! and the victim passes, without a struggle or a motion, from the repose of sleep to the repose of death! It is the assassin's purpose to make sure work; and he plies the dagger, though it is obvious that life has been destroyed by the blow of the bludgeon. He even raises the aged arm, that he may not fail in his aim at the heart, and replaces it again over the wounds of the poniard! To finish the picture, he explores the wrist for the pulse! He feels for it, and ascertains that it beats no longer! It is accomplished. The deed is done!

He retreats, retraces his steps to the window, passes out through it as he came in, and escapes. He has done the murder. No eye has seen him, no ear has heard him. The secret is his own, and it is safe!

Ah! gentlemen, that was a dreadful mistake. Such a secret can be safe *nowhere*. The whole creation of God has neither nook nor corner where the guilty can bestow it, and say "It is safe." Not to speak of that eye which pierces through all disguises, and beholds everything as in the splendor of noon, such secrets of guilt are never safe from detection, even by men. True it is, generally speaking, that "murder will out." True it is, that Providence hath so ordained, and doth so govern things, that those who break the great law of Heaven by shedding man's blood seldom succeed in avoiding discovery. Especially, in a case exciting so much attention as this, discovery must come, and will come, sooner or later. A thousand eyes turn at once to explore every man, every thing, every circumstance, connected with the time and place; a thousand ears catch every whisper; a thousand excited minds intensely dwell on the scene, shedding all their light, and ready to kindle the slightest circumstance into a blaze of discovery.

Meantime the guilty soul cannot keep its secret. It is false to itself; or rather it feels an irresistible impulse of conscience to be true to itself. It labors under its guilty possession, and knows not what to do with it. The human heart was not made for the residence of such an inhabitant. It finds itself preyed on by a torment, which it dares not acknowledge to God or man. A vulture is devouring it, and it can ask no sympathy or assistance, either from heaven or earth. The secret which the murderer possesses soon comes to possess him; and, like the evil spirits of which we read, it overcomes him, and leads him whithersoever it will. He feels it beating at his heart, rising to his throat, and DEMANDING disclosure. He thinks the whole world sees it in his face, reads it in his eyes, and almost hears its workings in the very silence of his thoughts. It has become his master. It betrays his discretion, it breaks down his courage, it conquers his prudence. When suspicions from without begin to embarrass him, and the net of circumstances to entangle him, the fatal secret struggles with still greater violence to burst forth. It *must* be confessed. It *will* be confessed. There is no refuge from confession, but suicide, — and suicide is confession.

279. HONORÉ DE BALZAC. *Lucien de Rubempré*. (c. XV); and *The Last Incarnation of Vautrin*. (c. II, Miss Wormeley's translation.)

[Lucien de Rubempré was a sentimental, fashionable youth, of weak will, who had fallen completely under the control of the Abbé Carlos Herrera, a pretended Spanish priest and spy. Herrera was really a desperate and hardened criminal, by name Jacques Collin, nicknamed Trompe-la-Mort. He plotted a vast scheme to secure a rich marriage for Lucien, obtain for him high official position, and thereby amass wealth. Lucien knew fully Collin's nefarious character, and entered into the plot. He accordingly courted Mlle. Clotilde de Grandlieu, a noble heiress. Meantime he prepared to give up his mistress, Esther Gobseck, a beautiful Jewess, who truly loved him. Esther had been given by an aged admirer, Baron de Nucingen, the sum of 750,000 francs, which she kept in her room. In despair at her impending loss of Lucien, Esther took poison, and was found dead in her bed by the servants; who immediately absconded with the 750,000 francs. But just before this, unknown to Esther, her grand-uncle, the usurer Gobseck, had died, leaving her sole heiress to his 7,000,000 francs. The Baron had hurried to Esther's house, to inform her of the inheritance from her uncle, but found her dead, and his own gift gone. The police and the coroner came to investigate the cause of Esther's death. Under her pillow they found her will, leaving all her property to Lucien. (The will had in fact been forged by Jacques Collin, after her death, but this forgery was not detected.) Her sudden death, her will bequeathing all to Lucien, and the disappearance of the Baron's gift, gave rise immediately to the suspicion that Lucien and Collin had murdered her. Warrants were issued for their arrest. Collin is arrested. Lucien is pursued by the police, and is

found with Mlle. de Grandlieu, just as they are exchanging pledges of marriage.] . . .

The gallop of several horses was heard, and in a moment a squad of gendarmes surrounded the little group, much to the astonishment of the two ladies.

"What do you mean by this?" said Lucien, with the arrogance of a fashionable young man.

"Are you Monsieur Lucien de Rubempré?" asked a person who was the public prosecutor of Fontainebleau.

"Yes, monsieur."

"You will sleep to-night in La Force; I have a warrant to arrest you." . . .

"Of what crime is monsieur accused?" asked Clotilde, whom the duchess was entreating to get into the carriage.

"Of theft, and murder," replied the corporal of gendarmes.

Baptiste lifted Mademoiselle de Grandlieu in a dead faint into the carriage. At midnight Lucien was locked up in the prison of La Force, where he was kept in solitary confinement. The Abbé Carlos Herrera had been brought there on the previous evening. . . .

Before entering into the terrible drama of a criminal examination, it is necessary to explain the normal process of a case of this kind, so that its divers phases may be better understood. . . . A crime is committed. If detected in the act, the suspected persons are taken to the nearest guardhouse and put in the cell called in popular parlance "the violin," probably on account of the music — of cries and tears — that is heard there. From there they are taken before the commissary of police, who makes a preliminary inquiry and has the power to release them if a mistake has been made; otherwise they are next taken to the depot, or guardhouse

talks with the persons suspected, and their statements as to their whereabouts and conduct at the time in question are important links in unraveling a mystery. These investigations by the police have no doubt cleared the record of many an innocent suspect. The object is to ascertain the truth, not, as the public seem to think, fasten the commission of a crime upon some one — whether guilty or innocent.

Within the last year or two probably all have seen an exemplification upon the stage of "The Third Degree." One connected with the police department cannot witness this play without being thoroughly impressed with the thought that the audience only gets a portion of the author's idea — the reputed methods of the police. . . . No true and sincere police officer who has witnessed this play of "The Third Degree" will disagree with me that it does a gross injustice to that hard-working body of men who preserve the peace and dignity of the various municipalities of this country, and an endeavor should be made to correct the false impressions given the public of police officials and police methods by this play. . . . No police official would take this play seriously, but the public will. . . .

There may have been individual cases where police officials have used improper and unfair methods to obtain results, but the "Third Degree" is and always should be simply a battle of wits, the only object being to get at the truth. There can be no set rules for gaining information from a person suspected, but brute force to accomplish the result should never be resorted to, and any police official should be promptly dismissed who employs harsh measures to obtain statements. The methods of acquiring information depend upon the circumstances of each case and the disposition and mental faculties of the person under suspicion. . . . A crime has been committed. It is reported to the police; facts may come slowly or quickly. On the spur of the moment the head of the detective bureau must evolve a theory — what was the motive for the crime — who may have had an object in committing it? Some one is suspected, brought in and questioned. The one object is to get the truth. A searching examination is made, call it the "third degree" or whatever you may; a great deal depends upon it. It may send out from police headquarters a suspect with his reputation good before the world; it may be the means of bringing a felon to justice. If the suspect is innocent, his story can generally be quickly checked up and proved, and the "third degree" is then the means of working to the advantage of the suspect and society. . . .

Chief JANSSEN, of Milwaukee. . . . I think that future historians will write of the present time as the age of yellow journalism and the age of yellow statesmanship. This "Third Degree" is brought about in this manner. A man is arrested charged with an offense. An investigation is set on foot, and the prisoner is asked certain questions in order to ascertain his defense or any excuse he may have in regard to certain suspicious circumstances that may surround him. When he finds he cannot get around those circumstances he tells the truth and admits the crime. Why? First, a cowardly conscience; second, that he *wants* to tell somebody about it; and third, that he may escape the maximum penalty prescribed for the offense with which he may be charged. What happens next? He goes to court and waives examination, and is bound over for trial, and he is sent to jail to await that trial. Now the shyster lawyer comes around, one who hangs

around the courthouse, or has been sent by a friend or accomplice of the man who is under arrest, and the first thing he asks is, "What have you done?" And the answer is, "I have talked with the Chief of Police" (or to the Detectives of the Police Department). His reply is, "Why, you fool, what did you do that for; I can't do anything for you unless you find some excuse for making that statement; what did they say to you?" and the prisoner answers that they said this and that, and the lawyer asks, "What did they do?" and he tells something, and with this the prisoner goes on, the lawyer always suggesting, until the prisoner finally gets the idea that he has made a mistake in making a statement to the police officer. The case of this man goes to trial, and the lawyer begins before the jury and tells about the violence that has been practiced on the prisoner, about the terrible strain he was placed under by the police in order to get this confession, and the poor creature who stands at the bar for trial is the victim of police persecution. The press is represented, and in a sensational manner starts to vilify the police. . . . This is why you hear so much about this "third degree," caused by the vile, unrestrained, unwarranted attacks published in the daily press, brought about by the action of these shyster lawyers and the prisoners themselves in misrepresenting what really did happen when they were questioned by the police. . . .

Chief DAVIS, of Memphis. . . . Many people have a wrong impression regarding what is generally designated as the "Third Degree." Simply sweating a prisoner, which we all know means only to interrogate him, is considered by many as a "Third Degree" act. If police officials were simply allowed to take the statement of a prisoner (when I say prisoner, I refer to a thief or murderer), and not attempt to contradict him in any manner, shape, or form, there would be few convictions of criminals. The intelligent police officer generally knows when he has a guilty man under arrest.

Now I wish to relate an incident that occurred during my career as Chief of Police of the city of Memphis, seventeen years ago. It was at the time that George T. O'Haver, then a Captain of Police, now the Principal of a Detective Agency bearing his name, and who is an honored member of this Association, was the chief actor in the case which I think will clearly show the necessity for action at critical times. As I remember the incident referred to, it was on one dark rainy night, in the city of Memphis, that the residence of C. C. Graham on Shelby street was entered by two thieves. In ransacking the house they entered the bedroom of Mr. Graham, who upon being awakened saw two men at his door. Seizing a pistol, he rushed into the hall, where he was fired upon by one of the burglars. He returned the fire, but unfortunately missed his man. One of the thieves ran down the front steps and out of the front door; the other thief broke through the rear window and escaped by means of the roof, jumping to the ground below. Police Officer T. B. Gwartney, who is still a member of the Memphis police force, was on duty near the Graham residence. He saw a man come running out of the yard bareheaded. I forgot to mention that the thief who ran down the front stairs after firing at Mr. Graham dropped his hat. Hearing the shots and seeing the man running, convinced the officer that a crime had either been committed or attempted. Concealed behind a large tree and with the man running towards him, Officer Gwartney remained secreted until the man was abreast of him and stepping out from behind the tree with

pistol pointed, he ordered the man to hold up his hands. Taken by surprise the thief did so, regardless of the fact that he had a pistol in his pocket. The police officer having him thus covered, took the weapon from him and forced him to walk in front until the Graham mansion was reached. By this time the whole house was lighted up and a few neighbors came upon the scene attracted by the shooting. The prisoner was securely handcuffed, and after learning the details of the attempted robbery and murder, Officer Gwartney brought his prisoner to Central Station.

Captain O'Haver was on duty that night, it being just after midnight. When brought in, Captain O'Haver quickly identified the overcoat worn by the thief as one that was stolen from the residence of Mr. Abe Frank, on Poplar Avenue only two nights previous, and in his pocket was found a wallet with the name of another citizen whose residence had been robbed the previous night; thus he was convinced, beyond a doubt, that he not only had a thief, but a would-be murderer in custody. On hearing the officer's statement, he began questioning the man, who refused to divulge his name, where he was from, where he roomed, or who his confederate was that was seen with him in the Graham residence. He was very abusive to Captain O'Haver, so I was informed the next day, and that officer, finally concluding that the Police Station proper was too public a place for him to further question the thief, took him downstairs into the cellar. What followed I don't know. But Captain O'Haver reported the next day that he finally succeeded in getting from him where he roomed, the description of his partner, and also that it was understood by them in the event they became separated they were to meet at the Tennessee House, which is in the southern portion of the city of Memphis. Repairing there with a full description of the man wanted, his arrest quickly followed, as he was found just as the thief reported to Captain O'Haver. It was afterwards learned that their names were Richard Lawrence and James Johnson, and they were escaped convicts from the Michigan penitentiary. They were convicted and each sentenced to ten years in the Tennessee Penitentiary.

Now *I don't know* what Captain O'Haver *did* to secure the information he desired. He is here himself among you, probably he will tell. But I want to say this to the Association, as I said to Captain O'Haver the next morning, *whatever you did* was right. You acted (as you said) the same as you would had you had a rattlesnake in your power that could talk and would not, to make it tell where its companion was, who had attempted to rob and murder an honored citizen of Memphis. It is just possible that the "third degree" in all its severity was exercised in this particular case. And I would like to see the member of this Association who would gainsay that Captain O'Haver was not fully justified in any measure he resorted to to gain the information he so desired. I simply recite this case to show that at times heroic methods must be resorted to to gain desired ends. You may call it whatever you please, the "third degree" or any other kind of degree, but it had the desired effect. No innocent man suffered and the guilty parties were punished.

282. ARTHUR TRAIN. *Courts, Criminals, and the Camorra*. (1912. p. 20.) No doubt the methods of the inquisition are in vogue the world over, under similar conditions. Everybody knows that a statement by

the accused immediately upon his arrest is usually the most important evidence that can be secured in any case. It is a police officer's *duty* to secure one, if he can do so, by *legitimate* means. It is his *custom* to secure one by *any* means in his power. . . . When it comes to the more important cases the accused is usually put through some sort of an inquisitorial process by the captain at the station house. If he is not very successful at getting anything out of the prisoner, the latter is turned over to the sergeant and a couple of officers who can use methods of a more urgent character. If the prisoner is arrested by headquarters detectives, various efficient devices to compel him to "give up what he knows" may be used — such as depriving him of food and sleep, placing him in a cell with a "stool-pigeon" who will try to worm a confession out of him, and the usual moral suasion of a heart-to-heart (!) talk in the back room with the inspector.

This is the darker side of the picture of practical government. . . . But the writer is free to confess that, save in exceptional cases, he believes the rigors of the so-called "third degree" to be greatly exaggerated. Frequently, in dealing with rough men rough methods are used. But considering the multitude of offenders, and the thousands of police officers, none of whom have been trained in a school of gentleness, it is surprising that severer treatment is not met with on the part of those who run foul of the criminal law. The ordinary "cop" tries to do his duty as effectively as he can. With the average citizen gruffness and roughness go a long way in the assertion of authority. Policemen cannot have the manners of dancing-masters.

The writer is not quarreling with the conduct of police officers. On the contrary, the point he is trying to make is that in the task of policing a big city, the rights of the individual must indubitably suffer to a certain extent, if the rights of the multitude are to be properly protected. We can make too much of small injustices and petty incivilities. Police business is not gentle business. The officers are trying to prevent you and me from being knocked on the head some dark night or from being chloroformed in our beds. Ten thousand men are trying to do a thirty-thousand-man job.

283. W. M. BEST. *The Principles of the Law of Evidence*. (3d Amer. ed. 1908. §§ 560–573, in part.) All false self-criminative statements are divisible into two classes, — those which are the result of *mistake* on the part of the confessionalist, and those which are made by him in expectation of *benefit*. And the former are twofold, — mistakes of *fact* and mistakes of *law*.

First, of mistakes of *fact*. A man may believe himself guilty of a crime either when none has been committed, or where a crime has been committed, but by another person. Mental aberration is the obvious origin of many such confessions. But the actors in a tragedy may be deceived by surrounding circumstances, as well as the spectators. A case has been cited in a former part of this work where a girl died in convulsions while her father was in the act of chastising her very severely for theft, and he fully believed that she died of the beating; but it afterwards turned out that she had taken poison

on finding her crime detected. If the surgeon had not made a post-mortem examination, that man would have been indicted for homicide, and most probably would have pleaded guilty to manslaughter, at least. . . .

Next, as to mistakes of *law*. It should never be forgotten that all confessions avowing delinquency in general terms are, more or less, "*confessiones juris*"; and this will in a great degree explain what to unreflecting minds seems so anomalous, — the caution exercised by British judges in receiving a plea of guilty. The same observation of course applies to all extrajudicial statements which are not mere relations of facts. And here one great cause of error is ignorance of the meaning of forensic terms; especially where the accused, conscious of *moral*, is unaware that he has not incurred *legal* guilt. Thus a man really guilty of fraud or larceny might plead guilty to a charge of robbery, through ignorance that, in legal signification, the latter means a taking of property accompanied with violence to the person, though it is popularly used to designate any act of barefaced dishonesty. . . .

In the other class of false self-criminative statements, the statement is known by the confessionalist to be false, and is made in expectation of some *real or supposed benefit*. It is obviously impossible to enumerate the motives which may sway the minds of men to make false statements of this kind. First, many are made for ease, and to avoid vexation arising out of the charge; and in some of these cases the cause of the false statement is apparent; viz. when it is made to escape torture, either physical or moral. In others it is less obvious. Weak or timorous persons, confounded at finding themselves in the power of the law, or alarmed at the testimony of false witnesses, or the circumstantial evidence against them or distrustful of the honesty or capacity of their judges, hope by an avowal of guilt to obtain leniency at their hands. . . .

But false self-criminative statements also arise from objects wholly collateral, relating either to the party himself or to others. With respect to the first of these. (1) A false confession of an offense may be made with the view of stifling inquiry into other matters; as, for instance, some more serious offense of which the confessionalist is as yet unsuspected. (2) The most fantastic shape of this anomaly springs from the state of mental unsoundness which is known by the name of "*tædium vitæ*." Several instances are to be found, where persons tired of life have falsely accused themselves of capital crimes, which were either purely fictitious, or were committed by others. In such cases the maxim of the continental lawyers, "*Nemo auditur perire volens*" may be applied with advantage. (3) "In the relation between the sexes," says Bentham, when treating of the subject of false confessions, "may be found the source of the most natural exemplifications of this, as of so many other eccentric flights. . . ." And so sensible was the canon law of this country of the danger of false confessions from this source that, as we have seen, it would not allow adultery to be proved (at least for the purpose of divorce "*a vinculo matrimonii*") by the unsupported confession, judicial or extrajudicial of the wife. . . . (4) "Vanity," observes the jurist above quoted, "without the aid of any other motive, has been known (the force of the moral sanction being in these cases divided against itself) to afford an interest strong enough to engage a man to sink himself in the good opinion of one part of mankind, under the notion of raising himself in that of another. . . ." False statements of this kind are

sometimes the offspring of a morbid love of notoriety at any price. The motive that induced the adventurous youth to burn the temple of Ephesus would surely have been strong enough to induce him to declare himself, however innocent, the author of the mischief, had it occurred accidentally. (5) Instances may be found of false confessions made with a view to some specific collateral end. The Amalekite who falsely accused himself of having slain Saul presents an early and authentic instance. . . . And whether from such morbid love of notoriety, or mere weak-mindedness, or a love of mischief, it is almost invariably the case that murders of a specially horrible kind — as, for instance, the Whitechapel murders of prostitutes in 1888 and 1889 — are followed by a series of false confessions. . . .

Hitherto we have been considering cases where the false confession is made with the view of benefiting the confessionalist himself. We now proceed to those in which other parties are involved. (1) The strongest illustrations of this are where the person who makes the false confession is desirous of *benefiting others*; as, for instance, to save the life, fortune, or reputation of, or to avert suffering from, a party whose interests are dearer to him than his own. A singular instance of this is said to have taken place at Nuremberg, in 1787, where two women in great distress, in order to obtain for the children of one of them the provisions secured to orphans by the law of that country, falsely charged themselves with a capital crime. They were convicted; and one was executed, but the other died on the scaffold, through excitement and grief at witnessing the death of her friend. . . . The less exalted motive of getting money has sometimes had the same effect. After the publication of the third edition of his work, the author received a letter on this subject from Mr. T. T. Meadows, British Consul at Newchwang, Northern China, to the effect that in China the personation of criminals, and that in cases involving capital punishment, is a well-known fact. "The inducement," observes Mr. Meadows, "is not always money. Juniors in families have been known to personate their criminal seniors, and even domestic slaves or serfs their guilty masters to whom they were attached." The custom supplies the chief incident in Mr. James Payn's novel "By Proxy." (2) The desire of *injuring others* has occasionally led to the like consequence. Persons reckless of their own fate have sought to work the ruin of their enemies by making false confessions of crimes and describing them as participators. We shall feel little surprise at this when we recollect how often persons have inflicted grievous wounds on themselves, and even in some instances, it is said, committed suicide, in order to bring down suspicion of intended or actual murder on detested individuals.

The anomaly of false confession is not confined to cases where there might have been a criminal, or *corpus delicti*. Instances are to be found in the judicial histories of most countries where persons, with the certainty of incurring capital punishment, have acknowledged crimes now generally recognized as impossible. We allude chiefly to the prosecutions for witchcraft and visible communion with evil spirits which, in former ages, and especially in the seventeenth century, disgraced the tribunals of these realms. Some of them present the extraordinary spectacle of individuals, not only freely (so far as the absence of physical torture constitutes freedom) confessing themselves guilty of these imaginary offenses, with the minutest details of time and place, but even charging themselves with having, through the

demoniacal aid thus avowed, committed repeated murders and other heinous crimes.¹

The above causes affect, more or less, every species of confessorial evidence. But *extra-judicial*, confessorial statements, especially when not plenary, are subject to additional infirmative hypotheses, which are sometimes overlooked in practice. These are *mendacity* in the report, *misinterpretation* of the language used, and *incompleteness* of the statement. (1) *Mendacity*. The supposed confessorial statement may be either wholly or in part a fabrication of the deposing witnesses. And here it should not be forgotten that, of all sorts of evidence, that which we are now considering is the most easy to fabricate, and however false, the most difficult to confront and expose by any sort of counter-evidence, direct or circumstantial. (2) *Misinterpretation*. No act or word of man, however innocent or even laudable, is exempt from this. . . . Unfounded inferences are sometimes drawn from words supposed to be confessorial, but which were used with reference to an act not identical with the subject of accusation or suspicion; as where a man who has robbed or beaten another, hearing that he has since died, utters an exclamation of regret for having ill-treated him. . . . (3) The remaining cause of error in confessorial evidence of this nature is "incompleteness"; *i.e.* where words, though not misunderstood in themselves, convey a false impression for want of some explanation which the speaker either neglected to give, or was prevented by interruption from giving, or which has been lost in consequence of the deafness or inattention of the hearers. "Ill hearing makes ill rehearsing," said our ancestors. Expressions may have been forgotten or unheeded in consequence of witnesses not being aware of their importance; *e.g.* a man suspected of larceny acknowledges that he took the goods against the will of the owner, adding that he did so because he thought they were his own. Many a bystander, ignorant that this latter circumstance constitutes a legal defense, would remember only the first part of the statement.

284. **THE HERMIONE CASE.** (JOHN PAGET. *Judicial Puzzles*. 1876. p. 64.)

Dr. Southwood Smith, in his "Lectures on Forensic Medicine," after observing how common false self-inculpatory evidence is, gives some remarkable instances in which it has occurred.² Of these the following is perhaps the most striking: In the war of the French Revolution the "Hermione" frigate was commanded by Captain Pigot, a harsh man and a severe commander. His crew mutinied, and carried the

ship into an enemy's port, having murdered the captain and many of the officers under circumstances of extreme barbarity. One midshipman escaped, by whom many of the criminals, who were afterwards taken and delivered over to justice one by one, were identified. Mr. Finlaison, the Government actuary, who at that time held an official situation at the Admiralty, states: "In my own experience I have

¹ See the cases of Mary Smith, 2 How. St. Tr. 1049; and of the Three Devon Witches, 8 How. St. Tr. 1017; the note to the case of the Bury St. Edmond's Witches, 6 How. St. Tr. 647; and the case of the Essex Witches, 4 How. St. Tr. 817, the latter especially. The confessions of Anne Cate, 4 How. St. Tr. 856, of Rebecca West, *id.* 840, of Rose Hallybread, *id.* 852, of Joyce Boanes, *id.* 853, and of Rebecca Jones, *id.* 854, are among the most remarkable.

² London Medical Gazette, January, 1838.

known, on separate occasions, more than six sailors who voluntarily confessed to having struck the first blow at Captain Pigot. These men detailed all the horrid circumstances of the mutiny with extreme minuteness and perfect accuracy; nevertheless, not one of them *had ever been in the ship*, nor had *so much as seen Captain Pigot in their lives*. They had obtained, by tradition, from their messmates, the particulars of the story. When long on a

foreign station, hungering and thirsting for home, their minds became enfeebled; at length they actually believed themselves guilty of the crime over which they had so long brooded, and submitted with a gloomy pleasure to being sent to England in irons for judgment. At the Admiralty we were always able to detect and establish their innocence, in defiance of their own solemn asseverations."

285. **THE GLOUCESTER CHILD-MURDER.** [Printed *ante*, as No. 110.]

286. **THE CASE OF THE BOORNS.** (*American Criminal Reports*. ed. John F. Geeting. Vol. XII, p. 221; Vol. XV, p. 223.)¹

On the 19th of May, 1813, Stephen and Jesse Boorn, with Russell Colvin and Lewis Colvin, his son, were seen in the morning, by a neighbor, one Thomas Johnson, in Manchester, Vermont, picking up stones in a field. They were seemingly in a quarrel. Johnson had a full view of them, but was concealed from their sight. In the course of the quarrel, according to the testimony of Lewis, Colvin first struck Stephen, who then knocked the former down with a club. The blow brought no blood. Lewis ran off, and neither he nor Johnson saw Colvin again.

The sudden departure of Colvin excited at the time some inquiry as to what had become of him. As he was, however, in the habit of mysteriously absenting himself, sometimes for months together, being occasionally in a state of mental derangement, it was supposed by his friends and neighbors that he would shortly return. There were, however, some vague suspicions that this time he had been murdered. They arose from the fact of the quarrel, and from contradictory declarations by the Boorns in regard to his disappearance or

death. These circumstances were not deemed sufficient, however, to warrant their arrest. They both remained unmolested in the village until 1818, when Stephen removed to Denmark, in New York, making a visit to Manchester in the winter of 1818-1819.

Probably these men would never have been brought to trial, if an uncle of theirs had not, sometime in 1819, dreamed that Colvin came to his bedside and declared that he had been murdered, and that the uncle must follow the ghost, who would lead him to the spot where the body lay. This dream being repeated three times, was finally attended to. Search was made in the place indicated, being where a house had formerly stood. Under the house was a hole about four feet square, made for the purpose of burying potatoes, but filled up at the time of the search. The pit was opened, and only a large knife, a penknife, and a button found in it. Mrs. Colvin accurately described these articles previously to their being shown to her; and having seen them, declared the large knife and the button to have belonged to her husband. This wonderful dream,

¹ The citations of the original accounts of this case are fully given in Mr. Geeting's notes. — Ed.

as near as we can learn, took place in April, 1819. It created a great sensation in the neighborhood, and was deemed by many as a providential interference for the detection of the murdered. Immediate search was thereupon made for the body of Colvin, concerning whose murder by the Boorns no doubt now existed. Toward the end of April, 1819, on the strength of this dream, Jesse Boorn was arrested in Manchester. His examination was commenced on the 27th of April, during which day, as well as on the three following, search was unsuccessfully made for the body of Colvin. The ghost had played them false. It was not to be found in the pit indicated, nor in any other place ingenuity could assign. Still, so strong was popular belief in the honesty of their mysterious informant, that no one questioned his truth. Two pieces of bone were found in a hollow stump, which were pronounced to be the nails of a human toe — a cluster of bones was found in the same place. Several physicians thought them human — only one thought otherwise. In order to determine this matter conclusively, they dug up a leg, which had been amputated from a man about four years previously, and upon comparing the two sets of bones, it was unanimously determined that the set first found did not belong to the human race.

But people would not admit the fallibility of their ghost, especially as the bones first found were discovered by the agency of a dog, in the most approved mode of canine sagacity. It was therefore surmised that the body had been burnt, and some parts not consumed cast into the stump and other bones put amongst them for deception. This surmise gained strength from the fact that shortly after the disappearance of Colvin, a barn belonging to the dreamer was accidentally consumed by fire, and about the same time a log heap was burnt by

the Boorns near the place where the ghost said the body was to be found.

Upon the examination of Jesse, the magistrate allowed none of this stuff to be given in evidence. The facts relied on were, the disappearance and continued absence of Colvin, the quarrel, and the contradictions and observations before alluded to. These circumstances were deemed insufficient to warrant his detention. He was accordingly on the eve of being discharged when he stated to some of the myrmidons of the jail, "that the first time he had an idea that his brother Stephen had murdered Colvin, was when he was here last winter; he then stated that he and Russell were hoeing in the Glazier lot; that there was a quarrel between them; that Colvin attempted to run away; that he struck him with a club or stone on the back part of his head or neck, and had fractured his skull, and supposed he was dead. That he could not tell what had become of the body." He mentioned many places where it might be found. Search was accordingly made, but to no purpose.

A warrant was immediately issued for the apprehension of Stephen, who was committed to jail on the 15th of May. He strongly asserted his innocence, and was severe upon Jesse for making the confession. The latter, after an interview with Stephen, retracted all he had said, declaring the whole to be false. They were, however, committed to take their trial before the Supreme Court of Vermont, to be holden in Manchester, in September, 1819. During the time of their imprisonment, before the trial, they were frequently visited by a clergyman. "They evinced no contrition," but persisted in solemnly declaring their innocence. At length, in October, 1819, they were brought to trial, but such was the excitement against them that it was difficult to get a panel, almost every one in the vicinity having

expressed his opinion against the prisoners.

Upon the trial, about fifty witnesses were examined; the principal testimony was as follows:

Thomas Johnson, sworn. I was a neighbor to the Boorns and Colvin. In the early part of the month of May, seven years ago, last spring, I saw one morning, Stephen Boorn, Jesse Boorn, Russell Colvin, and his son Lewis Colvin, picking up stones. They appeared to be in a quarrel. I had a full view of them, although they could not see me. I have never seen Russell Colvin since. Stephen said he was not in the field picking stones at the time Russell went off, but that he went off at that time. Jesse, while in imprisonment, told me that he was assisting in shoeing an horse, when Russell went off. Stephen said the woodchuck they had for dinner the day Russell went off was killed by him, when mending fence for a Mr. Hammond. Having purchased the land where this quarrel took place, the children found and brought home an old moldy rotten hat — I knew it to be the hat of Russell Colvin. In the cellar hole stood a thrifty apple tree about three feet high, which was taken away the season after I noticed it.

Lewis Colvin (son of Russell Colvin), sworn. He said that at the time Russell went off, he was picking stones with him, and Stephen and Jesse Boorn — that a quarrel arose between Stephen and Russell — that Russell struck Stephen first — that Stephen knocked Russell down with a club, and that he (the witness) ran away, and saw no blood — that Stephen told him not to tell that he struck Russell — that he had never seen Russell since.

It appeared from the testimony of many witnesses that a jackknife and a button was found in the old cellar hole which were recognized as having once belonged to Russell Colvin — that he had occasionally

absented himself from his family, and was at times in a state of mental derangement — that bones had been found, which by some were supposed to be human bones, but which appeared, from the most conclusive evidence, not to be human bones.

Truman Hill, sworn. He stated that he had the keys of the prison in which the Boorns were imprisoned — that he exhorted Jesse to tell the truth, and that if he told a falsehood it would increase his trouble — that he confessed that he was afraid that Stephen had murdered Colvin, and that he believed he knew very near where the body was buried — that when the knife and the hat of Colvin were shown him, he was much agitated. He said he urged Jesse to confess nothing but the truth.

Sally Colvin (wife of Russell Colvin, and sister to the Boorns) stated that about four years since Stephen said I could swear the child with which I was pregnant, for he knew that Colvin was dead. Jesse also said that I could swear it.

Daniel D. Baldwin, and Mrs. Baldwin to the same effect said that about three years since, Stephen told them that Colvin went off in a strange manner into the woods at the time he, Jesse, Colvin, and Lewis were picking stones — that Lewis had gone for drink, and when he asked them where Colvin was gone? one answered, gone to hell; the other that they had put him where potatoes would not freeze.

Numerous witnesses testified to the contradictory declarations of the Boorns in regard to the disappearance or death of Colvin. The testimony of Silas Merrill to the confession of Jesse Boorn was as follows:

Silas Merrill, sworn. Testified that as Jesse was returned to prison from time to time from the court of inquiry, that he had been urged to confess; that one night in the prison we got up, and Jesse said that Stephen knocked Colvin down twice,

broke his skull, and the blood gushed out; that his father came up there several times, and asked if he was dead, and said, damn him; that all three of us took the body and put it into the old cellar, where father cut his throat; that he knew the jackknife to be Colvin's; that Stephen wore Colvin's shoes; that about a year and an half after, they took up the bones; put them under a barn that was burned; then pounded them up and flung them into the river; that father put some of them into a stump, etc.

The following written confession of Stephen, made Aug. 27, 1819, was rejected by the Court; but as its contents were alluded to by oral testimony, it was introduced by the prisoner's counsel.

Stephen Boorn. "May the 10th, 1812, I, about 9 or 10 o'clock, went down to David Glazier's bridge and fished, down below Uncle Nathaniel Boorn's, and then went up across their farms, where Lewis and Russell was, being the nighest way, and set down and began to talk, and Russell told me how many dollars benefit he had been to father, and I told him he was a damned fool; and he was mad, and jumped up, and we sat down close together, and I told him to sit down, you little tory; and there was a piece of beech limb about two feet long, and he caught it up and struck at my head as I sat down; and I jumped up, and it struck me on one shoulder, and I caught it out of his hand, and struck him a back-handed blow, I being on the north side of him; and there was a knot on it about one inch long. As I struck him, I did think I hit him on his back; and he stooped down; and that knot was broken off sharp, and it hit him on the back of the neck, close in his hair; and it went in about half of an inch on that great cord; and he fell down; and then I told the boy to go down, and come up with his uncle John; and he asked me if I had killed

Russell, and I told him no, but he must not tell we struck one another. And I told him when he got away down, Russell was gone away; and I went back and he was dead; and then I went and took him and put him in the corner of the fence by the cellar hole, and put briers over him and went home, and went down to the barn and got some boards, and when it was dark I went down and took a hoe and boards and dug a grave as well as I could, and took out of his pocket a little Barlow knife, with about half of a blade, and cut some bushes, and put on his face and the boards, and put in the grave and put him in, four boards on the bottom and on the top, and t'other two on the sides, and then covered him up, and went home, crying along, but I warn't afraid as I know on. And when I lived to William Boorn's I planted some potatoes; and when I dug them I went there, and something I thought had been there, and I took up his bones and put them in a basket, and took the boards and put on my potato hole, took the basket and my hoe, and went down and pulled up a plank in the stable floor, and then dug a hole, and then covered him up, and went into the house and told them I had done with the basket; and took back the shovel, and covered up my potatoes that evening. And then, when I lived under the West mountain, Lewis came and told me that father's barn was burnt up; the next day, or the next day but one, I came down and went to the barn, and there was a few bones; and when they was to dinner, I told them I did not want any dinner, and went and took them, and they warn't only a few of the biggest of the bones, and throwed them in the river above Wyman's, and then went back, and it was done quick too, and then was hungry by that time, and then went home, and the next Sunday I came down after

money to pay the boot that I gave to boot between oxens; and went out there and scraped up them little things that was under the stump there, and told them I was going to fishing, and went, and there was a hole, and I dropped them in, and kicked over the stuff, and that is the first anybody knew it, either friends or foes, even my wife. All these I acknowledge before the world."

The body of Colvin was not found, nor anything approaching nearer to it than the toenails. The confessions had been the result of much solicitation. Jesse was told that if he would confess the facts, it would probably be the means of clearing him. It appeared in evidence that several had promised to sign for their pardon if they would confess; at the same time telling them that there was no doubt they would be convicted upon the testimony that was then against them. The jury, after a trial occupying five days, a "short, judicious and impressive charge" from Mr. Justice Doolittle, and a "lengthy and appropriate one" from Mr. Chief Justice Chase, rendered a verdict of guilty against both the prisoners. They were accordingly sentenced to be executed on the 28th of January, 1820.

So much distress was manifested by these men upon learning their fate, that the usual reaction almost immediately took place in the public mind. Notwithstanding their confessions, they now vehemently asserted their innocence. A petition was presented to the legislature for a commutation of punishment, which was granted to Jesse, but refused to Stephen. The former was accordingly carried to the State prison on the 29th of October. Stephen remained in the "inner dungeon" of the jail with "heavy chains on his hands and legs, being also chained to the floor." During his confinement his agony is described as extreme. He was unwilling to die, both on his own and

his family's account, and vehemently protested his entire innocence.

A clergyman, Lemuel Haynes, who visited him in prison, reported: "I visited him frequently with sympathy and grief, and endeavored to turn his mind on the things of another world; telling him that as all human means failed, he must look to God as the only way of deliverance. I advised him to read the holy scriptures, to which he consented, if he could be allowed a candle, as his cell was dark; this request was granted; and I often found him reading. He was at times calm; and again impatient. The interview I had with him a few days before the news came that it was likely that Colvin was alive, was very affecting. He says to me, 'Mr. Haynes, I see no way but I must die; everything works against me; but I am an innocent man; this you will know after I am dead.' He burst into a flood of tears, and said, 'What will become of my poor wife and children; they are in needy circumstances, and I love them better than life itself.' I told him God would take care of them. He replied: 'I don't want to die. I wish they would let me live even in this situation, some longer; perhaps something will take place that will convince people that I am innocent.'"

Whatever may have been public opinion on their conviction, it was shortly changed, for on the 22d of December, 1819, *the murdered man was brought alive to Manchester!* The reaction in favor of the Boorns was now excessive. Stephen, sentenced to be hung, was released amidst the congratulations of the crowd and the peal of artillery. Jesse, then at hard labor in the State prison, was forced to wait the slower process of a regular discharge. Both became the heroes of the moment, and enjoyed, as a slight recompense for their months of agony, the sympathy of their former persecutors.

It appeared that when Colvin left his native town, he went to Dover, in New Jersey, and resided in a state of harmless mental derangement in the family of a Mr. Polhamus, during the whole time of his absence. The brother-in-law of Mr. Polhamus, a Mr. Chadwick, who lived at a distance of forty miles from Dover, seeing an account of the trial of the Boorns in the "Evening Post," which paper he was not in the habit of reading, and had *taken up at that time by the merest apparent accident*, had an idea that the resident in Mr. P.'s house was the man for whose supposed murder the Boorns were indicted. Under this impression he published a letter, in which, as we suppose — for we have never seen the letter

nor any intimation of its contents — he stated his suspicions that his brother-in-law's guest was the supposed murdered man. This suspicion was communicated to a Mr. Whelpley, of New York, formerly of Manchester, and well acquainted with Colvin. Mr. Whelpley went to New Jersey in quest of Colvin, and being convinced of his identity brought him to Manchester. Thus, by what may be considered almost a direct interposition of Divine Providence, two innocent men were restored to society; and, at least in one instance, it was satisfactorily proved, that lawyers may undertake the defense of "atrocious criminals" against the clearest conviction of the people, with truth, honesty, and justice on their side.

287. MRS. MORRIS'S CASE. (A. C. PLOWDEN. *Grain or Chaff; the Autobiography of a Police Magistrate*. 1903. p. 269.)

... One day, just as I was about to leave the Court, a charge was brought in of larceny from Whiteley's shop, in the Westbourne Grove. The accused was a young girl, slight and graceful, and daintily dressed. Her face was buried in her hands, and she was evidently deeply distressed. A detective officer stepped into the witness box and quickly informed me that the prisoner had been seen to put some shoes into her pocket without paying for them, and that she had been arrested as she left the shop. The shoes were of small value, but there seemed little doubt that they had been feloniously taken. I granted a remand, admitting the prisoner to bail, but it was many weeks before she was able to attend the court. When she did appear her counsel explained that she had been seriously ill from shock, and suffered acutely. With regard to the charge, she had no defense to offer, and could only throw herself on the mercy of the Court. It was not difficult to be merciful in such a case; indeed, to be merciful was to be just. I

felt she had been punished enough, and I allowed her to be discharged on her recognizances to come up for judgment if required.

Four years after, I noticed sitting in the court a young woman, charmingly dressed, whom I had no difficulty in recognizing as the same who had stolen the things from Whiteley's. She was seated so as to be almost opposite to me, and she appeared desirous of attracting my attention. Presently a letter was handed up to me, in which, after recalling herself to my memory, she went on to say that I had saved her life by not sending her to prison. She was sure, therefore, I would not refuse the small favor she wished to ask, which was that she might attend the court daily in the hope of being of some service to any of her sex who might be in trouble. Now that she knew what it was to stand in a dock charged with crime, her heart went out to any woman in the same position, and she longed to be of use. I readily acceded to her request, and for a few weeks

the graceful little figure brightened the court with her presence, like a sunbeam. She appeared very busy with her notes, and seemed to take an intelligent interest in the work she had undertaken. . . .

[After a while, she ceased to attend the court.] Within a fortnight the poor girl had committed suicide by throwing herself out of a window. From a report which I had read in the newspapers it appeared that she had been taken ill with influenza, which had affected her brain — never, I imagine, too strong. And so ended her tragic little life. She was not strong enough, poor child, to fight the world's battle alone. . . .

Mrs. Morris, for that was her name (she was a widow, and not the young girl I supposed), possessed very decided traits of character. I am indebted to Mr. W. T. Stead, who knew her perhaps better than any one else, for particulars of her life and history, which have interested me greatly. She appears to have been intelligent, brave, and self-willed, with a full share of the vanity of her sex. Her personal courage amounted almost to heroism. I am told that in her crusading zeal for philanthropic causes which she had at heart, she would venture into the worst slums of the East End, by night as well as by day, quite careless of any personal risk that she might run. The death of her husband left her heartbroken, and was followed by a complete breakdown of her health, attended by morbid symptoms which probably had much to say to her subsequent suicide. Nevertheless, she was able to leave behind her an unpublished autobiography, written with great vivacity and frankness. The incident which brought her into the Marylebone Police Court evidently affected her whole life. The shock of the accusation was followed by an illness of which catalepsy was only one of the symptoms, and which brought her to

death's door. She was affectionately nursed by kind friends, and on her recovery was persuaded to accept an offer of marriage from a young and impressionable doctor who had attended her throughout with no less devotion than skill. But she was never able to get out of her mind the horror and disgrace of being regarded as a thief. It colored her thoughts incessantly, whether she was raving with delirium or struggling towards convalescence. As the day approached when she would have to appear in Court she determined on suicide in one form or another rather than demean herself by going before the magistrate. Finally, when the terrible trial was over, and happiness seemed to be within her reach, an unguarded remark by her lover, reflecting as she thought on her character, stung her as so intolerable that she broke off the engagement and committed suicide, leaving a letter behind her to explain her conduct. . . .

I have taken the following extracts from her "Life": "I then left the shop, and had just passed into the street, and was thinking how delightful the fresh air was and how frightfully weak and tired I felt, when a shop walker caught hold of my arm and asked to see my bills. I showed them to him, but he did not seem satisfied, and he asked me if I would step into the manager's room. 'Certainly, if you wish it,' I answered. Then they took all my things away from me, and I, too weary and headachy to care what they did, sank down on the nearest chair almost exhausted. I noticed that they spread the bills out on the table, and compared each article with them, and calling in several men, had a discussion in an undertone, which I either did not hear, or do not remember. But very shortly one of them turned to me and said,

"Where did you get this pair of shoes?"

"I brought them in to change," I said.

“‘No,’ he said, ‘you stole them!’”

“‘I stole them!’ I repeated after him, with wide-open eyes; ‘what do you mean?’ these awful words quite taking away my headache for the instant.

“‘Yes,’ he repeated; ‘you deliberately stole them. Mr. — saw you put them into your bag, and you wrapped this pair,’ pointing to a tiny pair of satin ones without any heels, and marked one shilling. The same man then asked me my name and address, while the others all seemed to be laughing, as if a great joke were going on. I was bewildered to madness, all that I know is that I refused to give it, telling them ‘it was no business of theirs. If they had anything against me they could punish me as much as ever they liked, but I would not allow them to bring disgrace or discredit on the people I loved — the sweet mother and sisters who had been so good to me.’ They say I added in an undertone, ‘You may send me to prison, kill me if you like, life is not worth living; but you shall not bring discredit on my people.’ Then I dimly recollect half a dozen cruel looking men saying, ‘She won’t give her name, won’t she? that looks fishy! You’d better search her,’ said the ringleader of my tormentors. So they either turned out my pockets, or made me do so, but they only discovered a handkerchief, my notebook — chiefly full of my own poetry, which they must have kept, for I never saw it again — and a paper bag containing several greengages which was marked ‘Southend,’ from which they concluded that I lived down there, for they talked a great deal about it. After that I do not remember anything, for a dreamy sense of the unreality of life beset me, and my mind, as regards anything that really happened, is a perfect blank. To make my whole story understood, I must now tell it, not from my own memory, but from what I have since

been told by kind friends, and what I have gathered from newspaper accounts.

“It seems that Mr. Whiteley’s assistants, after thoroughly convincing themselves that I was a ‘thief,’ in spite of my offering them eight pounds for the shoes, and seeing that I then possessed thirty shillings in my purse, which would have enabled me to buy them several times over had I wished to do so, sent for a policeman and gave me in charge. They say I did not raise the slightest objection, until he proposed to put handcuffs on me, then I began to rave and storm, until quite suddenly my whole manner changed, and as the policeman subsequently told me, I became as meek as a lamb. . . . On my arrival at Marylebone Police Court, I was told that I should be locked up in a dark cell, until I gave my name and address. . . .

“They then took me before a magistrate, and charged me with stealing two pairs of shoes valued one at ten shillings and the other at a shilling. He then asked me if I pleaded guilty. It is recorded — for I remember nothing of all this — that I answered in a very excited voice and manner, trembling so violently all the while that I shook the dock. ‘If they said I had taken them, it must be so, although I knew nothing of it. If so, I suppose I must have done it on a sudden impulse, for I certainly did not want the shoes, they did not fit me, and I had numbers of pairs at home, and never meant to steal them.’ I then added, ‘Send me to prison — give me three years’ penal servitude — but don’t bring disgrace on my friends — don’t tell them you think me a thief!’ Now it seems to me most unlikely that I stole those shoes on a sudden impulse. For, had it been so, I should surely have had some recollection of the impulse. And why, I ask myself, should I ever have had an impulse to steal shoes which I did not want, and, even if I had wanted them,

would not have fitted me, being several sizes too small? Some uncharitably minded persons may remark that I might have wished to pawn them. But I ask that person why I should begin to pawn things thus, when I had plenty of money, and no unsatisfied needs, when I never did so when I was hard up, nay starving! I don't know that it's wrong to pawn your things, but I do know that I have never pawned a single thing in my whole life. . . . They tell me, that at six o'clock, when the van came which was to take me to the jail, laden with its crowd of erring flesh, I gave one long, bitter cry, then fell to the ground in a dead faint. So they fetched a four-wheeler, and laying me flat on one seat, a policeman mounted guard over me on the other. When I ultimately arrived, the authorities stated that they had seldom seen a more miserable object. . . . [I was then taken to the hospital.] All that night I was delirious, talking wildly, and keeping every one awake by shrieking and laughing, and refusing to stop in bed. But next morning I was so exhausted that I lay all day in a state of dead catalepsy, and for days I remained in this state, seeing nothing, knowing no one, and being fed artificially. At last came a time when no one thought I could live through the night. My friends all prayed for me; I know not if their prayers were answered, but I did not die, and from that time the sickness left me, and by very slow degrees I got better. Gradually I began to know my friends again, then I sat up for a few minutes; then after many days they robed me in a white dressing gown, not more white than my face, and the doctor carried me to an easy chair in front of the low French window. Well do I remember that day — it seemed to me like the first dawn of summer, I had been taken ill on the first of July, now it was nearing the end of September. But soon exhausted I

was put back to bed, then I remember I was alone with the dear doctor who had always been so good to me. . . .

"'Ethel, dear,' he said, oh so gently, 'will you tell me everything that happened just before you were taken ill?'

"'Yes, poor Edwin died,' I said.

"'Yes, but that was some time before. Don't you remember, for instance, spending the day with me at Southend?'

"'Yes, I remember something about it. I felt very seasick on the boat. I suppose that was what brought on all this sickness I've had ever since.'

"'But next day, what did you then?' he asked.

"'I had an awful headache, but I went out soon after breakfast and bought Maude a hat. I hope she got it all right. Poor little thing, I expect she trimmed it herself, and she does make them look such guys!' and I laughed long and merrily at by-gone recollections of Maude's hats.

"'But he refused to share my amusement, looking as serious as the grave, and continued blushing, I noticed, up to the roots of his hair.

"'Did you buy any shoes that morning?'

"'No, but I think I changed some. But somehow, dear, that seems to have been mixed up with my dreams — I have everlastingly dreamed of shoes all the time I've been ill. Silly — isn't it?'

"'But — my darling, tell me, tell me, what did you dream about them?' he persisted.

"'I don't know: it's all confused and muddled, and something different every night,' I answered.

"'Coming still nearer, and taking my face between his two hands, he looked deep into my eyes as if he would fain read my soul, and said in a voice broken and husky with emotion —

"'Did you ever dream that you stole a pair of shoes?'

"'I did not speak, neither did I

move. Truths always seem to force themselves on me like flashes of lightning, so there is nothing gradual in the process. And after that instant there was no need for him to tell me that I was wanted as a thief. I knew it. The scene at Whiteley's — the confusion of the bills, the men who had amused themselves at my expense, the policeman who had wished to handcuff me and drag me through the streets, it all came back, not as idle dreams, but as the realities of life. For a few brief seconds no torture in hell could have been greater. Then I dropped my head into my hands and knew no more."

There is much more to the same effect that I could quote.

What is the impression that is left? Aye or No — did she steal the shoes?

On the one hand, there is her plea of "Guilty" in the Police Court. Against it, there is the knowledge of all that she said, and did, and suffered — the strenuous protest of all her subsequent life. There is also the improbability that had she been guilty she would have taken the matter so much to heart as she did. Remorse cuts deep, but nothing stings like a false accusation. Only perhaps this is certain, that she paid a heavy penalty.

288. HUGO MÜNSTERBERG. *On the Witness Stand*. (1909. p. 77.) . . . The study of the association of ideas has attracted the students of the human mind since the days of Aristotle; but only in the last century have we come to inquire systematically into the laws and causes of these mental connections. . . . The school of associationists began to explain our mental life as essentially the interplay of such associations. . . .

One aspect dominates in importance: I can measure the time of this connection of ideas. Suppose that both my subject and I have little electrical instruments between the lips, which, by the least movement of speaking, make or break an electric current passing through an electric clockwork whose index moves around a dial ten times in every second. One revolution of the index thus means the tenth part of a second, and, as the whole dial is divided into one hundred parts, every division indicates the thousandth part of a second. My index stands quietly till I move my lips to make, for instance, the word "dog." In that moment the electric current causes the pointer to revolve. My subject, as soon as he hears the word, is to speak out as quickly as possible the first association which comes to his mind. He perhaps shouts "cat," and the movement of his lips breaks the current, stops the pointer, and thus allows me to read from the clockwork in thousandth parts of a second the time which passed between my speaking the word and his naming the association. . . . I may find out how long it takes if my subject does not associate anything, but simply repeats the word I give him. If the mere repetition of the word "dog" takes him 325 thousandths of a second, while the bringing up of the word "cat" took 975 thousandths, I conclude that the difference of 650 thousandths was necessary for the process of associating "cat" and "dog." In this way, during the last twenty years, there has developed an exact and subtle study of mental associations, and through such very careful observation of the time-difference between associations a deep insight has been won into the whole mental mechanism. The slightest changes of our psychical connections can be discovered and traced by these slight varia-

tions of time, which are, of course, entirely unnoticeable so long as no exact measurements are introduced. . . .

Like many other branches of experimental psychology, the doctrine of association has become adjusted to the practical problems of education, of medicine, of art, of commerce, and of law. It is the last which chiefly concerns us here — a kind of investigation which began in Germany and has since been developed here and abroad.

For instance, our purpose may be to find out whether a suspected person has really participated in a certain crime. He declares that he is innocent, that he was not present when the outrage occurred, and that he is not even familiar with the locality. An innocent man will not object to our proposing a series of one hundred associations to demonstrate his innocence. A guilty man, of course, will not object, either, as a declination would indicate a fear of betraying himself; he cannot refuse, and yet affirm his innocence. Moreover, he will feel sure that no questions can bring out any facts which he wants to keep hidden in his soul; he will be on the lookout. As long as nothing more is demanded than that he speak the first word which comes to his mind, when another word is spoken to him, there is indeed no legal and no practical reason for declining, as long as innocence is professed. Such an experiment will at once become interesting in three different directions as soon as we mix into our list of one hundred words a number, perhaps thirty, which stand in more or less close connection to the crime in question — words which refer to the details of the locality, or to the persons present at the crime, or to the probable motive, or to the professed alibi, and so on.

The first direction of our interest is toward the choice of the associations. Of course, every one believes that he would be sure to admit only harmless words to his lips; but the conditions of the experiment quickly destroy that feeling of safety. As soon as a dangerous association rushes to the consciousness, it tries to push its way out. It may, indeed, need some skill to discover the psychical influence, as the suspected person may have self-control enough not to give away the dangerous idea directly; but the suppressed idea remains in consciousness, and taints the next association, or perhaps the next but one, without his knowledge. He has, perhaps, slain a woman in her room, and yet protests that he has never been in her house. By the side of her body was a cage with a canary bird. I therefore mix into my list of words also "bird." His mind is full of the gruesome memory of his heinous deed. The word "bird," therefore, at once awakens the association "canary bird" in his consciousness; yet he is immediately aware that this would be suspicious, and he succeeds, before the dangerous word comes to his lips, in substituting the harmless word "sparrow." Yet my next word, or perhaps my second or third next, is "color," and his prompt association is "yellow": the canary bird is still in his mind, and shows its betraying influence. The preparation of the list of words to be called thus needs psychological judgment and insight if a man with quick self-control is to be trapped. In most cases, however, there is hardly any need of relying on the next and following words, as the primary associations for the critical words unveil themselves for important evidence directly enough.

Yet not only the first associations are interesting. There is interest in another direction in the associations which result from a second and a third repetition of the series. Perhaps after half an hour, I go once more through

the whole list. The subject gives once more his hundred replies. An analysis of the results will show that most of the words which he now gives are the same which he gave the first time; pronouncing the words has merely accentuated his tendency to associate them in the same connection as before. If it was "house" — "window" first, then it will probably be "house" — "window" again. But a number of associations have been changed, and a careful analysis will show that these are first of all the suspicious ones. Those words which by their connection with the crime stir up deep emotional complexes of ideas will throw ever new associations into consciousness, while the indifferent ones will link themselves in a superficial way without change. To a certain degree, this variation of the dangerous associations is reënforced by the intentional effort of the suspected. He does not feel satisfied with his first words, and hopes that other words will better hide his real thoughts, not knowing that just this change is to betray him.

But most important is the third direction of inquiry: more characteristic than the choice and the constancy of the associations is their involuntary retardation by emotional influence. A word which stirs emotional memories will show an association time twice or three times as long as a commonplace idea. . . . The retardation is not always confined to the dangerous association alone, but often comes in a still more pregnant way in the following or the next following association, which on the surface looks entirely harmless. The emotional shock has perturbed the working of the mechanism, and the path for all associations is blocked. The analysis of these secondary time retardations is the factor which demands the greatest psychological skill.

A few illustrations from practical life may make the whole method clearer.

An educated young man of eighteen lived in the house of an uncle. The old gentleman went to consult a nerve specialist in regard to some slight nervous trouble of the younger friend. On that occasion he confided his recent suspicion that the young man might be a thief. Money had repeatedly been taken from a drawer and from a trunk; until lately he had had suspicions only of the servants; he had notified the police, and detectives had watched them. He was most anxious to find out whether his new suspicion was true, as he wanted, in that case, to keep the matter out of court, in the interest of the family. The physician, Dr. Jung, in Zurich, arranged that the young man come for an examination of his nerves. He then proposed to him a list of a hundred associations as part of the medical inspection. The physician said "head," the patient associated "nose"; then "green" — "blue," "water" — "air," "long" — "short," "five" — "six," "wool" — "cloth," and so on, the average time of these commonplace connections being 1.6 seconds. But there were thirty-seven dangerous words scattered among the hundred — words that had to do with the things in the room from which the money was abstracted, or with the theft and its punishment, or with some possible motives. There appeared, for instance, the word "thief." The association "burglar" seemed quite natural, but it took the boy suddenly 4.6 seconds to reach it. In the same way "police" — "theft" took 3.6 seconds, "jail" — "penitentiary" 4.2 seconds. In other cases the dangerous word itself came with normal automatic quickness, but the emotional disturbance became evident in the retardation of the next word. For instance, "key" — "false key" took only 1.6 seconds, but the following trivial association "stupid" — "clever "

grew to 3.0 seconds. "Crime" — "theft" came again promptly in 1.8, but the inner shock was so strong that the commonplace word "cook" was entirely inhibited and did not produce an association at all in 20 seconds. In the same way "bread" — "water" rushed forward in 1.6 seconds, but this characteristic choice, the supposed diet of the jail, stopped the associative mechanism again for the following trivial word. It would lead too far to go further into the analysis of the case, but it may be added that a repetition of the same series showed the characteristic variations in the region of the suspicious words. While "crime" had brought "theft" the first time, it was the second time replaced by "murder"; "discover" brought the first time "wrong," the second time "grasp." In the harmless words there was hardly any change at all. But, finally, a subtle analysis of the selection of words and of the retardations pointed to sufficient details to make a clear diagnosis. The physician told the young man that he had stolen; the boy protested vehemently. Then the physician gave him the subtle points unveiled by the associations — how he had bought a watch with the money and had given presents to his sister; and the boy confessed everything, and was saved from jail by the early discovery. . . .

Our chief interest belongs to the legal aspect of this method. Carried out with the skill which only long laboratory training can give, it has become, indeed, a magnifying glass for the most subtle mental mechanism, and by it the secrets of the criminal mind may be unveiled. All this has, of course, no legal standing to-day, and there is probably no one who desires to increase the number of "experts" in our criminal courts. But justice demands that truth and lies be disentangled. . . . The "third degree" may brutalize the mind and force either correct or falsified secrets to light; the time-measurement of associations is swifter and cleaner, more scientific, more humane, and more reliable in bringing out the truth which justice demands. Of course, we are only at the beginning of its development; the new method is still in many ways imperfect, and if clumsily applied it may be misleading; moreover, there exists no hard and fast rule which fits every case mechanically. But all this indicates only that, just as the bodily facts have to be examined by the chemist or the physiologist, the mental facts must be examined also, not by the layman, but by the scientific psychologist, with the training of a psychological laboratory.

289. JOHN. H. WIGMORE. *The Psychology of Testimony*. (Illinois Law Review. 1909. Vol. III, p. 410.) . . . The method of guilt-diagnosis by psychic associations was first publicly announced by Wertheimer and Klein in 1904, in the Austrian "Archiv für Kriminal-Anthropologie," edited by Hans Gross (their master, and professor of criminal law at Graz), and immediately taken up by Alfred Gross, at Prag. Meanwhile Jung, at Zurich, a psychologist, quite independently had been making similar applications, which first saw the light in 1905. Thereafter these two sets of researches were widely discussed in the same technical journals, from 1905 onwards. . . . But the method is as yet in its infancy. Such statements as the following are significant — for example, by Loeffler, professor at Vienna, in 1906:

"Before we dare to rely on it in a real criminal case, it must be first studied in thousands of laboratory experiments;"

by Gottschalk, advocate at Berlin, in 1906,

"This method is so far in such mere beginnings that one cannot speak of it as having practical utility; it can therefore be here ignored;"

by Lederer, of Prag, in 1906,

"The danger of this method is certainly an adequate reason for rejecting it. . . . Where it is not dangerous, it is usually quite fruitless. . . . We may positively say that criminal investigation has in the new method, either as hitherto put forward or as later to be improved, nothing useful to expect;"

or by Hoegel, chief State's attorney at Vienna, in 1907,

"I regard it as inconceivable to expect the State and the officers intrusted with the administration of justice to make use of an instrument so doubtful as this diagnostic against accused persons, even with their consent." . . .

Let us take the psychologists themselves. Listen, for example, to Freud, lecturing to the law students at Vienna in 1906.

"In the laboratory experiments you will never be able to reproduce the identical situation of the real accused person. . . . It should be your right, and even your duty, to carry on investigations for a series of years with suitable accused persons — but without letting the results have any influence on the decision of the magistrate, or better still, without his having any knowledge of the results reached as to a particular person's guilt. After years and years of accumulation and comparison of such data, all doubt of the utility of this psychological method would certainly be dissipated." . . .

Jung himself, after the first publication and critical reception of his results, frankly admitted, as late as 1906, in view of Stern's doubts and Krauss' critique,

"To this doubt I must fully agree; the discrimination between the guilty and the innocent thus is difficult. I agree with Krauss in apprehending great difficulties in the application of the experiments to judicial practice. . . . I shall not quarrel with any one who says that he is unconvinced by the method. I do not desire to pour cold water on it, but I am not reluctant to warn against an unjustifiable optimism. I do this in the interest of the method itself, which can easily be discredited by striking instances of misuse. It is a delicate instrument. . . . In its present state one must not expect too much from it, though it has an undeniable capacity for development."

and finally, in replying to Lederer's searching criticisms (above quoted), Jung again frankly declares in 1906,

"I am of Lederer's opinion, that *the psychological diagnostic, at least as yet, is thoroughly unsuitable for criminal practice.*" . . .

In short, on the Continent the new method appears to have met with a large, if not overwhelming, measure of hesitation, doubt, and opposition among jurists and even psychologists, in that the proposal of its practical use is regarded as quite premature at least. . . .

Now, as we read four centuries ago, in one of the earliest books on Evidence, "Præsumitur contra eum qui vellet innovare;" to which is the proviso, "nisi ista novitas esset utilis." So that the question here really is, Is this novelty useful and practicable? To this end let us ask, (1) Does the method indicate guilt? (2) Are its indications exact? (3) Are its conditions practical? And first,

(1) *Does this method indicate guilt?* Is not the most that is claimed by its adherents this much, that they can diagnose whether the person *knows* about the facts? And that *how* he came to know them — whether as a guilty doer or a mere spectator or even a disinterested witness or a newspaper reader — cannot be discriminated. For example, Alfred Gross himself plainly says,

“In those persons to whom the sought facts are known we can diagnose with passable certainty their guilt or at least their *strong suspicion or knowledge* of the facts. . . . Our task has been thus far no more than to answer the question whether a person knows of a certain fact or not.” . . .

So that the method, even at these highest claims for it, does not indicate in any way whether the person's knowledge is guilty or innocent. . . .

(2) *Are its indications exact?* In other words, are they not subject to so many possible interpretations as to be too loose for any practical use? . . . Let us first take, as an example, the detailed report of Loeffler, professor of criminal law at Vienna. His experiment was on an assistant State's attorney, supposed to be arrested in a foreign country on suspicion of crime, and trying to pass himself off there as a bookkeeper. One hundred reactions were taken; let us look at some of them. (a) In the first eight, the reaction-time of six of them is 1.4 to 1.8 seconds, but the fifth, being 2 seconds, is “Service-Forenoon,” which the observer calls a “self-betrayal” as *attorney*. Now, apart from this queer interpretation, look at the seventh reaction, which is the largest of the eight, 2.6 seconds, and reads “Write-Bill,” and note that this “self-betrayal” as bookkeeper is quite ignored by the observer. (b) In the next group, reaction No. 11 is 2.6 seconds, and is called a “betrayal” because Nos. 12 and 13, which are 7.4 and 3.4 seconds, are so much longer, though colorless in their words. (c) In another series, the reaction of No. 4, in 4.6 seconds, “Private-party,” is triumphantly taken as a “betrayal” because of the length of time — though it is hard to see why a State's attorney thinks of “private parties.” (d) In the same group, with reaction words “press-seen,” after “copy-made,” the observer complacently says of the former: “No bookkeeper would ever have reacted in this way!” and quite ignores the “copy-made.”

Now we do not lay stress on the radical lack of scientific method here; I mean that those who boast of testing everything by experiment should not affirm that “no bookkeeper would have reacted thus” without finding by experiment whether bookkeepers *do* thus react. What I desire to note is the delightful adaptability of this method to a judge's whims, in allowing him to prove whatever he is hoping to prove. For, observe the method as thus used: If the reaction-word is one essentially relevant to the accused's supposed occupation, it is a “betrayal”; if the word itself is colorless, but its reaction-time is long, it is also a “betrayal”; if it is colorless, and its own reaction-time is normal, but the *ensuing* reaction-time is long, it is again a betrayal; and if the word indicates some innocent occupation, it is ignored entirely. Now after reckoning these four possibilities, there will remain only a few reactions, so that the zealous magistrate is sure to “get his man”; there is no failure; he can always find guilt — *if he wishes to*. Might not any one whosoever be convicted on the above interpretations?

This whimsicality and arbitrariness of interpretation are constantly to be seen in the records of these experiments. For example, in Jung's own

primal experiment, by which he is said to have detected an actual thief, he found a so-called "betrayal" in the reaction "stranger-look," by interpreting it thus: "The young thief thought that some one had *looked* when he was stealing, and had informed on him, so that I, a *stranger*, now knew of it." Such interpretations will to many seem merely amusing; I will not call them "wild feats of jugglery," as one of the German lawyers does. Nor will I press analogous defects — the danger of trusting to the whims of all sorts of magistrates in using this method — the probability that a clever rascal could counterfeit a normal reaction-time — the lack of clear indication of different occupations, etc., as found by observed reaction-times — the fallacy of the assumption that a guilty person knows all the details of his crime, and the corresponding fallacy of fixing beforehand as criteria of guilt the reaction-words which the magistrate supposes to belong to the crime — the error of method in assuming, in our present state of knowledge, that there are any uniform associations with certain so-called "key-words" which are valid for every individual's experience. . . .

(3) *Are its conditions practical?* I will not here dwell on the impractical length of time required for adequate tests; nor on the relative cumbrousness of the method to other ordinary ones which would at least secure as much result; nor on the circumstance that it could (in this country) only be done either by trained psychologists, who would doubtless differ in their interpretations and thus introduce a new mass of disputed expert testimony, or by the police, who presumably would be too subject to bias to give great weight to their interpretation. I will simply point out that all the investigators do not frankly state that the willingness of the accused to submit to the test is assumed. So that, obviously, the accused cannot be put to it unless he waives his constitutional privilege against self-incrimination. And if he refuses, claiming his privilege, no inference can be drawn as to his guilt, under our law; for *we* cannot say, as a German or Austrian magistrate might say, "If he refuses, he would presumably find himself deemed guilty." And since the most experienced men at our bar accept it as a solid maxim, "If the client is guilty, never let him enter the witness-box," no guilty man would in an important case probably ever consent after the method became generally known. After all, then, since with us the method is not practicable at all unless the accused consents, it is hardly worth while to offer it to our bar as something that would play an important part in ordinary criminal practice.

TITLE III: THE INTERPRETATION OF SPECIFIC TESTIMONY, TO ESTABLISH THE EXTENT AND SOURCES OF ERROR

SUBTITLE A: EXTENT OF LATENT ERROR IN THE NORMAL TESTIMONIAL PROCESS
